Brazilian legislation consolidated the regulation of telework in the federal public administration and demonstrated a preponderant focus on the measurement of quantitative

results and the fulfillment of objective goals. By linking telework to the PGD, the norm establishes the need for deliverables to be measurable, including with the possibility of goals higher than those of in-person work.

This partial convergence between academia and legislation suggests that, although theory recognizes the complexity of performance—including subjective and well-being aspects—legislative practice prioritizes the tangible and the measurable, probably for reasons of accountability and control. The challenge, therefore, lies in how public bodies can go beyond the legal minimum, incorporating qualitative and humanized indicators without compromising the objectivity and transparency required by the public sector.

5 CONCLUSION

This study had as its general objective to analyze the performance indicators for the evaluation of telework in the Brazilian public administration, based on a systematic review of the literature related to the pertinent legislation. To this end, it sought to identify and synthesize the indicators proposed in academia, to map the legal framework, and to discuss the gaps and challenges in the application of these metrics in the context of the Brazilian public administration.

The articulation between the findings of academia and the legal panorama reveals that the Brazilian public administration finds itself in a stage of maturation in the management of telework. There is an opportunity for public bodies to go beyond minimum compliance with the law, developing more robust evaluation systems that absorb the propositions of the literature on the importance of more comprehensive indicators.

Therefore, it is concluded that individual performance evaluation in telework in the Brazilian public administration demands a hybrid and balanced model, which incorporates both the objectivity of quantitative goals and the quality of deliverables (as required by the PGD) and the essential subjectivity of behavioral skills, collaboration, and, above all, the public servant's well-being. The success of this evaluation lies in the capacity to reconcile the pursuit of efficiency and results, enshrined in the legislation, with the protection of the teleworker's health and motivation, ensuring that telework is sustainable and productive in the long term.

The main contribution of this study consists in bringing together the knowledge on the individual performance indicators of telework, offering an integrated panorama of the theoretical and legal perspectives. This may serve as a valuable reference for public managers in the design and improvement of their own evaluation systems, as well as contribute to academic research on the subject.

Despite the efforts undertaken, this study has some limitations, which may be mitigated in future research, such as empirical studies that investigate the real application and effectiveness of telework performance indicators in public organizations. In this sense, it is suggested for future research that case studies be carried out in federal public administration bodies that have already implemented telework in a consolidated manner, seeking to analyze in practice which indicators are being used, how they are collected, and what the perception of managers and public servants is regarding their effectiveness. Additionally, research exploring the relationship between performance evaluation in telework and the mental health of public servants, as well as comparative studies with international experiences, may further enrich the studies.

ABSTRACT

This article analyzes estate planning in light of personality rights theory and a gender perspective, considering the transformations proposed by Bill No. 4/2025, which aims to reform the Brazilian Civil Code. It argues that estate planning should be understood as an instrument of existential protection rather than merely patrimonial organization. The research adopts a qualitative, bibliographic, and documentary methodology, with a civil-constitutional and interdisciplinary critical approach. It examines the tension between private autonomy and the protection of vulnerable subjects, especially women in contexts of structural inequality. It concludes that expanding testamentary freedom may deepen social asymmetries if not interpreted through human dignity and gender-sensitive lenses.

Keywords: Estate Planning. Personality Rights. Gender. Intersectionality. Civil Code.

RESUMO

O presente artigo analisa o planejamento sucessório à luz da teoria dos direitos da personalidade e da perspectiva de gênero, considerando as transformações propostas pelo Projeto de Lei nº 4/2025, que visa reformar o Código Civil brasileiro. Parte-se da hipótese de que o planejamento sucessório deve ser compreendido como instrumento de tutela existencial, e não apenas como técnica de organização patrimonial. A pesquisa adota metodologia qualitativa, de natureza bibliográfica e documental, com abordagem civil-constitucional e crítica interdisciplinar. Examina-se a tensão entre a autonomia privada e a proteção de sujeitos vulneráveis, especialmente mulheres em contextos de desigualdade estrutural. Conclui-se que a ampliação da autonomia sucessória, se não interpretada à luz da dignidade da pessoa humana e da perspectiva de gênero, pode aprofundar assimetrias sociais.

1 INTRODUCTION

The Law of Succession, traditionally structured under a patrimonialist perspective, has been undergoing significant transformation in the contemporary Brazilian legal scenario. Such a reconfiguration stems from the centrality assumed by the dignity of the human person as a foundation of the legal order, as well as from the progressive functionalization of civil-law institutes, which come to be interpreted in light of values such as solidarity, existential protection, and the fulfillment of the person.

In this context, succession ceases to be understood as a mere transfer of assets by reason of death, assuming the role of an extension of the individual's life project, allowing their choices, values, and affective bonds to project themselves beyond biological existence.

In this movement of evolution, personality rights gain prominence as a structuring axis of contemporary civil interpretation. Such rights, inherent to the human condition, come to radiate effects over the various branches of Private Law, including the succession domain. Thus, the understanding is consolidated that the legal order must ensure broad protection for the dignity of the person, not limiting itself to the traditional categories but reaching all existential manifestations that demand legal protection. This perspective broadens the reach of civil norms and reinforces the need for a systematic reading geared toward the promotion of the human person.

As a consequence, the classic dichotomy between patrimony and personality tends to be attenuated. Patrimony comes to be understood not only as a set of economically appraisable assets, but as an instrument for the realization of individual freedom and autonomy. In the succession domain, this understanding intensifies, since the destination of the assets reflects existential choices, personal values, and affective relationships built over the course of life. Thus, succession also assumes a symbolic and identity-related dimension, linking itself to the continuity of the individual's existential project.

In this scenario, estate planning emerges as an essential tool of legal organization and the realization of private autonomy. More than a mechanism geared toward economic efficiency or the reduction of tax burdens, it presents itself as an instrument for the prevention of conflicts, the protection of family interests, and the preservation of personal and business values. Through it, it becomes possible to structure, in a conscious and strategic manner, the transfer of patrimony, aligning it with the existential objectives of the owner of the assets.

The complexity of the topic intensifies in the face of the contemporary proposals for reform of Civil Law, which seek to adapt the succession system to social and technological transformations. These changes raise relevant debates regarding the expansion of private autonomy, the loosening of traditional rules, and the redefinition of the subjects protected by

the succession system. In this context, a critical analysis is required that considers not only economic and formal aspects, but also the social impacts and the need to protect subjects in a situation of vulnerability, especially in light of approaches that recognize the plurality of experiences and structural inequalities.

In view of this panorama, the present study aims to examine the relationship between personality rights and estate planning, investigating in what way contemporary legal instruments can contribute to the protection of identity, of affective bonds, and of the dignity of the human person. To this end, the work is structured in axes that address the evolution of the concept of patrimony under an existential perspective, the modern mechanisms of estate planning, the legislative transformations under way, the non-patrimonial dimension of succession, and the need for an application of the Law that is sensitive to social vulnerabilities.

In the end, it seeks to demonstrate that estate planning, when oriented by ethical and constitutional foundations, can promote a succession justice that goes beyond the merely patrimonial logic, reconciling autonomy, responsibility, and intergenerational solidarity.

2 ON PERSONALITY RIGHTS AND THEIR PATRIMONIAL PROJECTION – CONTEMPORARY ESTATE PLANNING

2.1 ON THE LEGAL STRUCTURE OF PERSONALITY RIGHTS

Personality rights constitute the hard core of the legal protection of the human being. Unlike patrimonial rights, which are disposable, subject to prescription, and alienable, personality rights are, as a rule, non-transmissible and non-waivable, and their exercise cannot suffer voluntary limitation (Art. 11 of the Civil Code). Carlos Alberto Bittar (2015) defines them as the rights inherent to the person and to their dignity, which accompany the individual from birth—or even before, from the perspective of the unborn child (*nascituro*)—until after their death.

Historically, classical doctrine limited itself to protecting isolated physical and moral aspects, such as life, physical integrity, honor, and image. However, social and technological evolution required an expansion of this list. The theory of personality rights came to be a foundation of the Republic (Art. 1, III).

Contemporary civil-law doctrine, influenced by the thought of Pietro Perlingieri (2002), defends the existence of a general clause for the protection of personality. This means that the legal order protects not only the rights typified in the law, but any manifestation of human dignity that requires shelter. According to Luiz Edson Fachin (2003), this clause operates as

a radiating principle that obliges the judge to interpret all civil norms—including those of succession—in such a way as to maximize the existential protection of the individual:

The protection of personality is not exhausted in specific legal types, it being necessary to recognize a general protection, founded on the dignity of the human person, apt to encompass situations not expressly foreseen (Fachin, 2004, p. 55).

In this sense, the rigid distinction between being (personality) and having (patrimony) begins to fade. Stefano Rodotà (2010) points out that, in contemporary society, patrimony often serves as support for the exercise of freedom. Without a minimum of material resources, the individual cannot fully exercise their personality rights. Therefore, the protection of personality projects itself onto the management of assets, especially at the moment of succession, where the destination of the patrimony reflects the existential choices of the *de cuius*.

The reinterpretation of patrimony under the existential lens is fundamental for estate planning. Patrimony is not an end in itself, but a means for the realization of the life project. Maria Celina Bodin de Moraes (2010) argues that human dignity possesses a relational and temporal dimension. The individual builds their identity through their relationships and through the way they organize their life and their resources.

When a person plans their succession, they are, in fact, giving continuity to their life project. They may wish to protect a child with a disability, ensure the maintenance of a family business that generates jobs and preserves the family's legacy, or even allocate resources to social causes that marked their trajectory. In these situations, patrimony assumes a clear social and existential function. Estate planning, therefore, is the legal tool that allows this projection of personality onto patrimony to be respected after death, within the limits of legality and solidarity.

2.2 ON ESTATE PLANNING AND ITS LEGAL INSTRUMENTS

Estate planning may be defined as the legal-strategic process that aims to organize the transfer of a person's patrimony after their death, seeking to minimize family conflicts, reduce the tax burden, and ensure the continuity of businesses or personal values. Rolf Madaleno (2021) emphasizes that planning is an act of prevention and of love, for it prevents heirs from facing slow and costly probate proceedings, which often destroy patrimony and affective bonds.

Estate planning performs multiple and complementary functions in the legal and patrimonial sphere. From the organizational perspective, it allows the prior definition of the

destination of the assets, clearly establishing who will receive each portion of the patrimony, which contributes to the prevention of conflicts among heirs. On the economic plane, it seeks tax efficiency, especially with regard to the incidence of the ITCMD (Tax on Causa Mortis Transmission and Donation) and the IRPF (Individual Income Tax) [[nota: siglas tributárias brasileiras mantidas, com tradução do termo por extenso entre parênteses, conforme regra 5]], besides making possible the reduction of procedural costs related to succession.

Such a perspective must always be envisioned in a broad sense, so that, among the possibilities, the most efficient choice is made—not only from the tax standpoint. As Fleischmann and Tremarin Junior (2019, p. 625) explain:

although it is an essential element of analysis, tax efficiency cannot be considered one of the main objectives of estate planning, which does not mean a necessary saving of taxes. There will be situations in which, from the tax standpoint, estate planning will be inadvisable, but advisable from the standpoint of the perpetuity of the patrimony [...]. In this sense, before opting for the holding system, it may be important to analyze the traditional forms of planning and compare them with the use of the holding, for what leads to the choice of one form or another are the objectives of the plan.

In the preservative dimension, in turn, it reveals itself as an essential instrument for the continuity of family businesses, through the adoption of mechanisms such as shareholders' agreements and governance structures that ensure the stability of the business activity. Flávio Tartuce (2023, p. 1,945) teaches that:

Estate planning represents a technique of legal conformation of family and patrimonial relationships, functioning as a preventive mechanism of conflicts and an instrument of stability in private relationships.

It also presents an existential function, by making viable the inclusion of provisions of a non-patrimonial nature, such as the recognition of children, directives on funeral rites, and guidance regarding the management of digital assets, evidencing the interface between patrimony and personality rights.

Private autonomy is the engine of estate planning. It confers on the individual the power to create legal norms to regulate their own interests. In the succession domain, this autonomy manifests itself mainly in the freedom to make a will. However, in the current Brazilian system, this freedom is limited by the forced portion (*legítima*)—the reservation of 50% of the patrimony for the forced heirs (descendants, ascendants, and spouse), in accordance with Art. 1,845 of the Civil Code.

Judith Martins-Costa (2018) stresses that private autonomy is not an absolute right, but rather a functionalized one. It must serve lawful ends and respect the principles of

objective good faith and social function. The clash between the sovereign will of the author of the inheritance and the imperative protection of the family is the great theme of modern Succession Law. Bill No. 4/2025 proposes to shift this balance significantly in favor of individual autonomy, which requires a critical analysis of the social consequences of this choice.

The sophistication of contemporary estate planning manifests itself in the diversity of available legal instruments, frequently used in combination to meet the peculiarities of each family and patrimonial nucleus. Among these mechanisms, the will remains the most traditional instrument, being able to assume the public, sealed, or private modalities. Its main advantage lies in the possibility of revocation at any time, besides allowing the inclusion of provisions of an existential nature. However, it finds a limitation in the need to respect the forced portion (*legítima*), bearing only on the disposable part of the inheritance:

Often the will has the objective of reflecting the transactions entered into for the purpose of estate planning, ratifying them; for example, a father who donates an asset to one of his children—respecting what he could donate, in relation to the patrimony of which, at the moment of the liberality, he was the holder—and, in the expression of last will, exempts them from collation (*colação*). Indeed, the exemption from collation may take place in the will or by express reference in the title of the liberality (Vieira, 2020, p. 41).

Modern estate planning breaks with the view that the will is a mere inventory of assets. It comes to be a vehicle for the expression of personality. Provisions of a non-patrimonial character (Art. 1,857, § 2 of the Civil Code) gain prominence. The testator may use the instrument to: recognize a socio-affective child; appoint a guardian for minor children; establish directives on the destination of their mortal remains (cremation, organ donation); record confessions, requests for forgiveness, or bequeath moral and ethical values to the family.

These clauses are irrevocable even if the patrimonial will is annulled or revoked, demonstrating the supremacy of the existential aspect over the material one. Maria Celina Bodin de Moraes (2010) holds that these provisions are the conclusive proof that private autonomy projects itself beyond biological life, allowing the individual's voice to continue echoing in their affective community.

Another widely used instrument consists of donations with reservation of usufruct, which make possible the early transfer of the bare ownership to the heirs, preserving for the donor the right of use and enjoyment of the asset, such as the receipt of income or the permanence in the property until their death. It is an effective mechanism for avoiding the

incidence of probate on such assets, contributing to greater speed and economy in the succession process.

In the business sphere, family holding companies stand out, structured by means of the incorporation of a legal entity intended for the concentration of the family patrimony. In this model, succession occurs through the transfer of corporate quotas, which allows greater control over the administration of the assets, besides the insertion of restrictive clauses, such as non-seizability (*impenhorabilidade*) and incommunicability (*incomunicabilidade*), reinforcing patrimonial protection and family governance.

In addition, instruments of an insurance and pension nature also play a relevant role in estate planning. Private pension plans, especially in the VGBL and PGBL modalities, present the advantage of, as a rule, not being subject to probate, making possible the free designation of beneficiaries:

In PGBL plans (and provided that the participant is also a contributor to or beneficiary of Social Security), the contributions paid to the plan may be deducted from the calculation basis of Income Tax, by up to 12% of the annual gross income, in the option of the complete annual adjustment declaration (Girardi; Moreira, 2019, p. 634).

The case law of the Superior Court of Justice (Superior Tribunal de Justiça – STJ)¹ has been consolidated in the sense that such amounts, except in cases of fraud, do not form part of the calculation basis of the forced portion. In a similar manner, life insurance, by possessing an indemnity nature—as Article 794 of the Civil Code provides—is not characterized as inheritance, being paid directly to the beneficiaries, quickly and, in many cases, without the incidence of ITCMD.

Finally, prenuptial agreements (*pactos antenupciais*) and cohabitation contracts (*contratos de convivência*) constitute essential instruments in patrimonial and succession organization, for they allow the prior definition of the property regime applicable to the relationship, directly influencing the rights of the marital share (*meação*) and succession of the spouse or partner. In this way, it is evidenced that contemporary estate planning is not limited to a single instrument, but is built from an integrated legal architecture, capable of articulating economic efficiency, patrimonial protection, and the realization of existential interests.

Succession self-determination is the right of each person to be the architect of their own legal end. This includes the freedom not to leave an inheritance, to privilege philanthropic causes, or to establish conditions for the heirs to receive the assets (performance or conduct clauses, provided they do not violate human dignity).

Existential autonomy allows estate planning to be an instrument of emancipation. For example, an LGBTQIA+ person may use planning to ensure that their partner receives the protection that the biological family, at times hostile, would deny. In this case, estate planning acts as a protective shield for the identity and the affective bonds built during life, reaffirming that the family is a concept founded on affection and not only on blood.

Despite the broad freedom, the disposition of personality finds limits in ethics and public order (Gonçalves, 2023, p. 192). It is not admitted, for example, that a testator impose conditions that violate the religious, matrimonial, or professional freedom of their heirs. Such clauses are considered null for violating fundamental rights of the successors.

The challenge of the contemporary jurist is to balance the will of the deceased with the freedom of the living. Estate planning cannot be an instrument of tyrannical posthumous control, but rather a proposal of harmonious continuity. The ethics of solidarity must permeate all planning structures, ensuring that private autonomy does not become a vehicle of arbitrariness or unjustified exclusion.

3 ON THE REFORM OF THE CIVIL CODE: BILL No. 4/2025 AND THE RECONFIGURATION OF SUCCESSION

The processing of Bill No. 4/2025 in the Federal Senate, under the rapporteurship of Senator Rodrigo Pacheco, marks the beginning of a new era for Brazilian Civil Law. The proposal is the fruit of the work of a Commission of Jurists, presided over by Justice Luis Felipe Salomão (STJ), which sought to update the 2002 Code to reflect the transformations of Society 5.0. The Book of Succession is, without a doubt, one of those that suffered the most profound modifications, with the declared objective of simplifying the succession system and expanding individual freedom.

The foundations of the reform reside in the premise that the current model is excessively interventionist and bureaucratic. The commission argues that the Law must respect the will of the owner of the patrimony, allowing them to decide the destination of their assets with greater flexibility. In addition, the reform seeks to harmonize the Civil Code with the new forms of family and with the digital reality, themes that the 2002 legislator could not foresee in their totality.

The main guideline of Bill No. 4/2025 is the strengthening of private autonomy. The reform proposes the reduction of formal obstacles for the preparation of wills and, more importantly, the admission of new estate-planning instruments that were previously viewed with reservations or prohibited by the legal order.

One of the most significant advances is the regulation of Succession Pacts (Art. 426 of the current Civil Code, which prohibits the *pacta corvina*). Such an expression admits more than one meaning:

The expression succession pact is used, in a restricted sense, to designate the agreement or contract whose object is the succession of one or of both contracting parties. In a broad sense, however, the expression encompasses not only the agreements whose object is the succession of one of the contracting parties but also any and all contracts concerning the inheritance of a living person (Cruz, 1965, p. 94).

The bill proposes to make this prohibition of the *pacta corvina* more flexible, allowing the heirs and the author of the inheritance to enter into agreements during life regarding the future division, provided that certain ethical limits and the protection of vulnerable persons are respected. This brings unprecedented legal certainty for business families that wish to organize corporate governance and the succession of corporate quotas in an anticipated and consensual manner.

The most impactful and controversial change of Bill No. 4/2025 is the exclusion of the spouse and the partner from the list of forced heirs (Art. 1,845). In the current system, the spouse (and, by equivalence established by the STF in RE 878.694/MG, the partner) is guaranteed a portion of the inheritance, regardless of the testator's will, competing with descendants and ascendants.

The justification for this change is that the spouse already possesses protection through the marital share (*meação*) (depending on the chosen property regime). The commission of jurists holds that maintaining the spouse as a forced heir generates distortions, especially in marriages of short duration or where there has already been an effective patrimonial separation during life. The proposal allows the testator, should they have no descendants or ascendants, to dispose freely of 100% of their patrimony, being able to leave the partner with nothing in the succession, should they so wish.

In addition to the exclusion of the spouse, Bill No. 4/2025 proposes a redefinition of the calculation of the forced portion. The idea is to simplify the calculation basis and allow certain liberalities made during life not to be computed as an advance on the forced portion as rigidly as today.

The making of the forced portion more flexible aims to give more power to the author of the inheritance to privilege an heir who needs more care or who has contributed more to the formation of the patrimony. Francisco José Cahali (2019) observes that the forced portion, although it is an instrument of family solidarity, often stiffens planning and generates injustices in cases where the affective relationship between parents and children is nonexistent or

conflictual. The bill seeks a middle ground between total freedom and absolute family protection.

The reform also embraces modernity by including provisions on digital inheritance. The bill defines that digital assets (cryptocurrencies, airline miles, social-media profiles with economic value) form part of the hereditary estate. More than that, it establishes rules for access to private data, seeking to balance the successors' right to inheritance with the right to privacy and to the secrecy of the deceased's communications.

Digital inheritance is one of the most fertile fields for the study of personality rights in succession. What happens to our photos on Instagram, our conversations on WhatsApp, or our files in the cloud after death? The STJ, in REsp 1.660.168/RJ, began to tread this path by recognizing that digital assets possess legal relevance.

In this context, Carroll and Romano (2011) identify five types of digital assets that need to be considered after the death of a user: 1) devices and data, which include the deceased's electronic devices and the documents contained therein; 2) e-mails, which encompass received messages and the possibility of continued access to the account; 3) online accounts, services that require a username and password, containing text messages, photos, and/or videos; 4) online financial accounts linked to a bank or financial account; and 5) online businesses, such as virtual stores with the potential to generate revenue.

However, the great tension lies in the conflict between inheritance and privacy. While the heirs wish to access the memories of the deceased, the *de cuius* may have secrets that they did not wish to reveal. Existential estate planning allows the individual to appoint a digital curator or to use tools of the platforms themselves to define who may manage their digital legacy, ensuring that their memory is preserved in accordance with their will, protecting their honor and image *post mortem*.

The inclusion of digital assets in the Civil Code is, without a doubt, an indispensable legislative advance. As Facchini (2024) highlights, the current legal system is not capable of dealing with the new forms of patrimony that have emerged due to the digitalization of everyday life, especially when these assets possess economic relevance or symbolic value for the family members of the deceased.

The legislative proposal also relates to the protection of the personal data of the deceased, since Bill No. 4/2025 dialogues with the General Personal Data Protection Law (LGPD – Lei Geral de Proteção de Dados Pessoais, Law No. 13.709/2018) [[nota: sigla LGPD mantida, com tradução do termo por extenso, conforme regra 5]]. By granting the heirs the right to access or delete digital content, respecting privacy and personality rights even after death, the bill reinforces the protection of human dignity, as Matos (2024) argues.

However, as Lima (2023) points out, making access to digital assets more flexible may accidentally result in violations of privacy, especially if the deceased does not leave clear guidance. This question becomes particularly sensitive in the case of private messages, intimate media, and information shared with third parties that may be exposed without the consent of those involved.

Another delicate point concerns the applicability of the norms in the face of international platforms that operate under different legal regimes. The normative standardization proposed by Bill No. 4/2025 may come into conflict with the internal policies of these companies, which frequently refuse to allow access to inactive accounts without a court order, even when there is proof of death.

A further innovation is the genetic will (*testamento genético*), which allows the individual to dispose of the destination of their cryopreserved genetic material (eggs, sperm, embryos). This provision is fundamental for regulating *post mortem* succession in cases of assisted reproduction, avoiding ethical and legal conflicts over the filiation and succession rights of children conceived after the death of one of the parents.

Along the same lines of the innovations, the proposal of a new fideicommissum (*fideicomisso*) stands out, which bears a certain similarity to the Anglo-Saxon trust, in the sense of a true socioeconomic operation geared toward estate planning. In the words of Maria Helena Diniz (2022, p. 326):

A fideicommissum is the testamentary provision by which the testator transmits the inheritance or legacy to a fiduciary heir, with the charge of, upon their death or the fulfillment of a condition, transferring it to another beneficiary, called the fideicommissary.

Cláudia Stein Vieira (2020), in her Doctoral thesis defended at the Universidade de São Paulo, sets forth that our legal structure is not yet flexible enough to allow the patrimonial arrangements that are consonant with the current reality:

there is a relevant gap in the Brazilian system that is not directly filled by any institute currently in force. The Brazilian citizen lacks autonomy to benefit two persons, simultaneously or successively, in view of the compulsory conversion of the instituted fideicommissum into usufruct, if, at the time of the respective death, the fideicommissary is alive. Apart from this, there is no autonomy, in Brazil, to proceed with the various business, contractual, and succession arrangements made possible by the trust abroad (Vieira, 2020, p. 59).

The current doctrinal position turns toward the legitimacy of the constitution of the fideicommissum both in donation and in other contractual relationships, as Adriano Faria da Silva (2007, p. 163) teaches:

A significant impulse to this institute, for it could serve to regulate with greater certainty certain civil and mercantile legal transactions, still during the life of the institutor. In any case, even though not expressly foreseen in our legal order, there is no legal impediment to its institution by *inter vivos* acts, both in donations and in other contractual relationships. It seems perfectly viable to us to institute a fideicommissum in a contract of purchase and sale with an adjoined fideicommissary pact.

A relevant point of the proposal is the expansion of the versatility of the fideicommissum, which would come to serve multiple purposes, such as succession instruments, guarantee mechanisms, investment structures, and arrangements geared toward specific purposes, including for the protection of persons in a situation of vulnerability. This multifunctionality reinforces the potential of the institute as a central tool in contemporary patrimonial law.

The reformulation of the fideicommissum requires the clear definition of the duties and responsibilities of the fiduciary, who must act with high standards of diligence and loyalty, similar to the administrators of companies. The accountability for any losses arising from poor management or violation of fiduciary duties is an essential element for ensuring the trust and effectiveness of the institute.

4 ON THE PROTOCOL OF GENDER AND VULNERABILITY IN SUCCESSION LAW: ESTATE PLANNING AS AN INSTRUMENT OF EXISTENTIAL JUSTICE

Resolution No. 492/2023 of the National Council of Justice (Conselho Nacional de Justiça – CNJ) made obligatory the adoption of the Protocol for Judging with a Gender Perspective in all courts of the country. Although its application is more visible in cases of domestic violence or family law, its incidence in Succession Law is fundamental for ensuring the material equality promised by the Federal Constitution.

The protocol is defined not only as a manual of conduct, but as an analytical and interpretive method. It is grounded on the premise that the Law is not neutral and that the blind application of the norm may perpetuate historical injustices.

According to the guidelines of the CNJ, gender is used as a category of analysis to identify how the social constructions of masculinity and femininity create asymmetries of power. As the document points out:

Gender is a category of analysis that allows the understanding of social relations from a critical perspective, revealing the inequalities and hierarchies that are established from a social and cultural construction about what it is to be a man and what it is to be a woman (Brasil, 2021, p. 28).

To judge with a gender perspective in probate and succession means to recognize that the formal neutrality of the law may conceal historical injustices. The judge must be attentive to asymmetries of power, to the unequal division of domestic labor, and to the impact of succession decisions on the subsistence of women who, often, do not possess their own patrimony because they dedicated themselves to the care of the family. Estate planning, when it ignores these realities, may be an instrument for the perpetuation of female submission.

The theory of intersectionality, formulated by Kimberlé Crenshaw (1989), teaches that oppressions are not isolated, but overlap. Intersectionality demonstrates that categories such as gender, race, social class, sexuality, disability, and nationality do not act in isolation, but interconnect and mutually reinforce each other, creating matrices of domination that shape individual and collective experiences.

In Succession Law, this manifests itself when we analyze the situation of a Black, elderly, low-income widow. Her vulnerability is multidimensional. The estate planning of rich families uses holding companies and offshores, while the planning of poor families is often the absence of any instrument, leading to interminable probate proceedings that consume the little existing patrimony.

Intersectionality requires that the operator of succession law consider the social and racial context of the heirs. The exclusion of the spouse as a forced heir, proposed by Bill No. 4/2025, affects far more severely the women of the popular classes, who depend on state protection and on the partner's inheritance so as not to fall into absolute misery after widowhood.

The proposal to remove the spouse from the list of forced heirs is the point of greatest tension with the Gender Protocol. In Brazil, unpaid care work is performed mostly by women. This work allows the male partner to accumulate patrimony, while the woman sacrifices her career and her social security.

By allowing the testator to exclude the spouse from the succession, Bill No. 4/2025 ignores that the surviving spouse's inheritance is, in many cases, a form of deferred compensation for the care work provided over decades. Without the protection of the forced portion, the widow may be evicted from the property where she lived her whole life (except for the real right of habitation, which the bill maintains, but with limitations) and be left without resources for her basic maintenance. Therefore, the expansion of private autonomy, without

mechanisms of financial or alimentary compensation, may represent a setback in women's rights.

The invisibility of care work is one of the pillars of gender inequality. Classical Civil Law, focused on the circulation of goods, does not attribute direct economic value to affection and care. However, in contemporary estate planning, the possibility of including care-legacy clauses begins to be discussed, where the testator recognizes and specifically remunerates the heir (generally a daughter or wife) who dedicated themselves to their support in old age.

The recognition of this work must be an interpretive guideline. If Bill No. 4/2025 is approved, the courts must use the Gender Protocol to annul testamentary provisions that are manifestly abusive or that place the partner in a situation of indignity, using the general clause of good customs and the social function of the family as brakes on absolute autonomy.

Formal equality—all are equal before the law—is not sufficient in Succession Law. The abstract model of the individual—neutral and a property owner—does not exist in Brazilian social reality. Estate planning must be conceived for subjects situated in their realities of gender, race, and class.

It becomes, however, insufficient to treat the individual in a generic, general, and abstract manner. The specification of the subject of rights is necessary, who comes to be seen in their peculiarity and particularity. From this viewpoint, certain subjects of rights or certain violations of rights demand a specific and differentiated response [...]. This means that difference would no longer be used for the annihilation of rights, but, on the contrary, for their promotion (Piovesan, 2005, p. 46).

The feminist critique of Civil Law points out that the freedom to make a will, without social limits, is the freedom of the patriarch to maintain control over the destiny of the family. Democratic estate planning must be a process of family dialogue and not a unilateral imposition. Succession justice requires that private autonomy be exercised with social responsibility, ensuring that the death of the owner of the patrimony is not the beginning of the economic ruin of their vulnerable dependents.

Estate planning must be re-signified as a true instrument of legal protection, overcoming the merely fiscalist view centered on tax saving. Its primary objective comes to be the guarantee of security and dignity of the subjects in a situation of vulnerability within the family.

In this context, the adoption of specific mechanisms proves possible, such as the creation of reserve funds intended for the protection of children with disabilities, the institution of a lifelong usufruct in favor of the surviving spouse, the insertion of clauses of temporary inalienability with the aim of safeguarding spendthrift heirs (*herdeiros pródigos*), and, further,

the establishment of pensions or legacies of an alimentary nature, ensuring the subsistence of those who depended economically on the author of the inheritance. In this way, estate planning assumes an existential and protective function, aligning itself with the constitutional values of the dignity of the human person and of family solidarity.

In view of the changes proposed by Bill No. 4/2025, the role of the lawyer and the notary becomes even more relevant. They must act as ethical advisors, alerting the client to the risks of excluding heirs and proposing balanced solutions.

An effective strategy is the use of life insurance and private pension plans with specific beneficiaries, which ensure immediate liquidity without depending on the probate process. Another tool is the donation with a charge (*doação com encargo*), where the donor transfers the asset but imposes on the donee the obligation to care for a vulnerable third party. These strategies allow autonomy to be exercised in such a way as to promote family solidarity.

Family solidarity is a constitutional principle (Arts. 226 and 230 of the Federal Constitution) that must inform all estate planning. It does not mean nullifying the will of the individual, but rather harmonizing it with the duty of mutual support among the members of the family.

The ideal estate planning is that which manages to balance the freedom of the author of the inheritance with the legitimate expectation of the heirs. Solidarity manifests itself in the concern with the future of the family as a whole, preserving not only the patrimony, but the harmony and the affective bonds. Bill No. 4/2025, by giving more weight to autonomy, requires that solidarity be exercised in a voluntary and conscious manner, and not merely by legal imposition.

A rereading of the Brazilian succession system is then proposed, based on three structuring pillars that reorient its purpose in light of a contemporary and constitutional perspective. In the first place, the functionalization of autonomy implies understanding the freedom to make a will not as an end in itself, but as an instrument geared toward the protection of the person and the continuity of a lawful life project.

In the second place, intersectional protection requires that the succession norms be applied in a manner sensitive to the multiple vulnerabilities that may cut across the subjects, especially those related to gender, race, and age. Finally, the primacy of the existential imposes that the destination of the assets be conceived as an expression of the identity, choices, and values of the *de cujus*, ensuring, at the same time, respect for the dignity of the successors.

This rereading allows estate planning to be seen not as a taboo or a cold accounting of assets, but as an act of citizenship and of intergenerational responsibility, capable of promoting social justice within the family nucleus.

5 CONCLUSION

The analysis developed throughout this study allows the conclusion that the Law of Succession in the 21st century can no longer be understood in isolation, detached from the protection of personality rights and from the constitutional principles that govern family and social relationships. The transition from a strictly patrimonialist paradigm to a view that prioritizes the existential over the patrimonial reveals that assets, far from being an end in themselves, act as material and symbolic support for the realization of existential choices, the concretization of life projects, and the preservation of affective and moral legacies.

Estate planning, in this context, consolidates itself as the tool par excellence for the operationalization of this existential autonomy, allowing the individual to organize their succession in such a way as to reflect their identity, their values, and to protect those who make up their nucleus of care and affection.

The innovations proposed by Bill No. 4/2025 represent a significant milestone in the modernization of the Brazilian Civil Code, with respect to debureaucratization and the strengthening of private autonomy. The regulation of succession pacts, the making of the forced portion more flexible, and the inclusion of provisions on digital inheritance and the genetic will are advances that seek to align the legal order with the complexities of Society 5.0.

However, the proposal to exclude the spouse and the partner from the list of forced heirs imposes a warning sign and demands an in-depth reflection. As demonstrated, the application of a formal neutrality of the law, without considering social realities and asymmetries of power, may conceal and perpetuate grave gender injustices, especially in a social context where unpaid care work is mostly female and, often, invisibilized and economically devalued. The freedom to make a will, if exercised in an absolute manner and detached from the ethics of solidarity and social responsibility, runs the risk of becoming an instrument of exclusion and vulnerabilization, contradicting the very foundations of human dignity.

In this sense, the application of the CNJ's Protocol for Judging with a Gender Perspective and the adoption of an intersectional lens prove indispensable for the operator of the Law. Estate planning must be understood not only as a legal act, but as an act of care and social responsibility, which transcends the mere accounting of assets. It is not enough

for the system to be efficient in terms of patrimonial transmission; it must be, above all, fair and equitable. Succession justice requires that the will of the *de cuius* be respected, but that this respect not mean the material or moral abandonment of vulnerable dependents, especially those who contributed in a non-monetary manner to the formation of the family patrimony.

In the final analysis, the future of Brazilian Succession Law resides in the dynamic and constant balance among three structuring pillars: the functionalization of private autonomy, which understands the freedom to make a will as an instrument at the service of the person and of their lawful life project; the intersectional protection of vulnerabilities, which requires that the succession norms be applied in a manner sensitive to the multiple dimensions of oppression (gender, race, class, age) that may cut across the subjects; and the primacy of the existential, which imposes that the destination of the assets be conceived as an expression of the identity, choices, and values of the *de cuius*, ensuring, at the same time, respect for the dignity and the subsistence of the successors.

Only through a civil-constitutional interpretation, which harmonizes individual freedom with the duty of mutual support and intergenerational solidarity, will it be possible to build a succession system that honors the memory of the dead without compromising the dignity and the subsistence of the living, transforming estate planning into a true instrument of emancipation and existential justice.

ABSTRACT

This article analyses the contribution of feminist constitutionalism to the recognition of reproductive self-determination as a fundamental right in the contemporary Constitutional State. It starts from the premise that classical liberal constitutionalism was built upon an abstract and universal conception of the legal subject, which rendered women's experiences invisible and contributed to the reproduction of gender inequalities. The research investigates how feminist constitutionalism enables the reconstruction of the constitutional categories of liberty, equality and human dignity, allowing the recognition of women's reproductive autonomy as an essential dimension of fundamental rights. The article argues that reproductive self-determination constitutes an implicit fundamental right derived from the interaction between human dignity, substantive equality and existential freedom. The study adopts a deductive method based on bibliographical and documentary research, drawing upon feminist theory, contemporary constitutional theory and fundamental rights scholarship. It concludes that feminist constitutionalism provides theoretical tools capable of exposing the limitations of traditional constitutional interpretations and supporting the recognition of reproductive autonomy as an indispensable element of women's constitutional citizenship.

Keywords: Feminist Constitutionalism. Reproductive Self-determination. Fundamental Rights. Human Dignity. Gender Equality.

RESUMO

O presente artigo analisa a contribuição do constitucionalismo feminista para o reconhecimento da autodeterminação reprodutiva como direito fundamental no Estado Constitucional contemporâneo. Parte-se da constatação de que o constitucionalismo liberal clássico foi estruturado a partir de uma concepção abstrata e universal de sujeito de direito que invisibilizou experiências femininas e contribuiu para a reprodução de desigualdades de gênero. O problema de pesquisa consiste em investigar de que forma o constitucionalismo feminista possibilita a reconstrução das categorias constitucionais de liberdade, igualdade e dignidade humana, permitindo o reconhecimento da autonomia reprodutiva das mulheres como dimensão essencial dos direitos fundamentais. Sustenta-se a hipótese de que a autodeterminação reprodutiva constitui direito fundamental implícito decorrente da interação entre os princípios da dignidade da pessoa humana, da igualdade substancial e da liberdade existencial. Utiliza-se o método dedutivo, mediante pesquisa bibliográfica e documental, com

RESUMEN

El presente artículo analiza la contribución del constitucionalismo feminista para el reconocimiento de la autodeterminación reproductiva como derecho fundamental en el Estado Constitucional contemporáneo. Se parte de la constatación de que el constitucionalismo liberal clásico fue estructurado a partir de una concepción abstracta y universal de sujeto de derecho que invisibilizó experiencias femeninas y contribuyó a la reproducción de desigualdades de género. El problema de investigación consiste en indagar de qué forma el constitucionalismo feminista posibilita la reconstrucción de las categorías constitucionales de libertad, igualdad y dignidad humana, permitiendo el reconocimiento de la autonomía reproductiva de las mujeres como dimensión esencial de los derechos fundamentales. Se sostiene la hipótesis de que la autodeterminación reproductiva constituye un derecho fundamental implícito derivado de la interacción entre los principios de la dignidad de la persona humana, de la igualdad sustancial y de la libertad existencial. Se utiliza el método deductivo, mediante investigación bibliográfica y documental, con base en referentes de la teoría feminista, de la teoría constitucional contemporánea y de los estudios sobre derechos fundamentales. Se concluye que el constitucionalismo feminista ofrece instrumentos teóricos capaces de revelar las limitaciones de las lecturas tradicionales de la Constitución y de fundamentar el reconocimiento de la autonomía reproductiva como elemento indispensable para la ciudadanía constitucional de las mujeres.

1 INTRODUCTION

The consolidation of contemporary constitutionalism and the expansion of catalogues of fundamental rights have not been sufficient to eliminate the inequalities historically experienced by women. Although modern democratic constitutions are frequently presented as universal instruments for the protection of liberty, equality and human dignity, feminist criticism has shown that such categories were constructed on the basis of predominantly masculine reference points, producing mechanisms of exclusion that continue to influence the interpretation and application of law.

Classical liberal constitutionalism developed under the premise of the existence of an abstract subject of rights, formally universal and neutral. Historical experience, however, shows that this universal subject corresponded, to a large extent, to the white, heterosexual and economically privileged male experience. As a consequence, various dimensions of women's lives remained for centuries relegated to the private sphere, removed from effective constitutional protection and subjected to mechanisms of legal, social and moral control.

Among the issues that most clearly reveal this dynamic, reproduction stands out. Sexuality, motherhood and the control of women's reproductive capacity were historically regulated by legal and social institutions that limited women's autonomy and made their life projects conditional upon expectations previously defined by patriarchal structures. In this context, reproductive self-determination emerges as one of the principal categories of analysis for understanding the tensions between formal equality and substantive equality in the contemporary Constitutional State.

It is precisely against this backdrop that feminist constitutionalism arises. More than a thematic strand of constitutional theory, feminist constitutionalism constitutes a project of critical reconstruction of the fundamental categories of constitutional law. Its aim is not merely to broaden the legal protection of women, but to question the very epistemological assumptions that underpin the production and interpretation of law.

The research problem guiding this work consists in investigating how feminist constitutionalism contributes to the recognition of reproductive self-determination as a fundamental right in the contemporary Constitutional State.

The starting hypothesis is that feminist constitutional theory promotes a critical rereading of the traditional categories of liberty, equality and human dignity, making it possible to recognise reproductive autonomy as an essential dimension of women's constitutional citizenship. From this perspective, reproductive rights cease to be understood as merely private or moral matters and come to form part of the fundamental core of human rights.

The general objective is to analyse the theoretical foundations of feminist constitutionalism and its contribution to the recognition of reproductive self-determination as a fundamental right. Specifically, the aim is to examine the feminist critiques of the universal subject of liberal constitutionalism; to identify the main theoretical contributions to the reconstruction of traditional constitutional categories; and to investigate how such contributions provide a basis for recognising women's reproductive autonomy.

The relevance of the research is justified by the centrality assumed by debates concerning reproductive rights in contemporary constitutional democracies. In different legal systems, controversies relating to the voluntary termination of pregnancy, assisted reproduction, family planning and bodily autonomy continue to reveal tensions between fundamental rights, moral values and historical structures of gender inequality.

1.1 METHODOLOGICAL ASPECTS

The research is conducted by means of the deductive method, starting from the analysis of the theoretical categories of feminist constitutionalism in order to examine its contribution to the recognition of reproductive self-determination as a fundamental right. Bibliographical and documentary research is used, with a qualitative approach and an exploratory-explanatory character.

The theoretical framework is based on central female and male authors of feminist theory, contemporary constitutional theory and fundamental rights scholarship. Among them, John Stuart Mill, Simone de Beauvoir, Catharine MacKinnon, Kimberlé Crenshaw, Judith Butler, Martha Nussbaum, Beverley Baines, Daphne Barak-Erez, Tsvi Kahana, Laura Ronchetti and Simone Penasa stand out.

The analysis seeks to articulate contributions produced in different national contexts, especially in Brazil and Italy, making it possible to identify theoretical points of convergence and common challenges relating to the constitutional protection of women's reproductive autonomy.

2 THE FEMINIST CRITIQUE OF THE UNIVERSAL SUBJECT OF LIBERAL CONSTITUTIONALISM

2.1 JOHN STUART MILL AND THE DENUNCIATION OF WOMEN'S LEGAL SUBORDINATION

Although feminist constitutionalism is a contemporary phenomenon, its foundations can be identified in reflections developed as early as the nineteenth century. Among the

authors who contributed to the construction of an initial critique of legal inequality between men and women, John Stuart Mill stands out.

In *The Subjection of Women* (1869), Mill formulates one of the most forceful critiques of women's legal subordination found in classical liberal thought. By maintaining that the legal subjection of women constitutes one of the principal obstacles to human progress, the author breaks with naturalising conceptions that justified gender inequality on the basis of supposed biological or moral differences between the sexes.

Mill's contribution goes beyond the mere defence of formal equality. His central argument is that every limitation of human liberty requires rational justification compatible with the principles of justice. From this perspective, the exclusion of women from spaces of civil autonomy, political participation and the full exercise of citizenship could not be legitimised by traditions, customs or historically established social conventions.

By shifting the debate to the field of the legal and political justification of inequalities, Mill inaugurates an important line of reflection later deepened by contemporary feminist theories. Inequality between men and women ceases to be conceived as a natural phenomenon and comes to be understood as the result of social and institutional constructions susceptible to transformation.

The relevance of this perspective for feminist constitutionalism lies precisely in the possibility of questioning the naturalisation of social roles attributed to women. Questions relating to motherhood, sexuality and reproduction cease to be understood as inevitable expressions of feminine nature and come to be analysed as phenomena historically conditioned by relations of power and specific normative structures.

2.2 SIMONE DE BEAUVOIR AND THE CONSTRUCTION OF WOMAN AS THE "OTHER"

The critique of women's subordination gains theoretical depth in the twentieth century with *Le Deuxième Sexe*, published by Simone de Beauvoir in 1949. Regarded as one of the founding texts of contemporary feminism, the work breaks with biologising explanations of inequality between men and women and demonstrates that the feminine condition is the result of historical, social and cultural processes of the construction of difference.

The celebrated assertion that "one is not born, but rather becomes, a woman" synthesises the author's critique of the naturalisation of gender roles. For Beauvoir, the characteristics traditionally associated with femininity do not derive from an immutable biological essence, but from social mechanisms that shape behaviours, expectations and possibilities of existence.

In this context, the author develops the notion of otherness, according to which woman was historically constituted as the “Other”. While man was identified with universality, rationality and the condition of subject, woman was defined in a relational manner, as a being dependent on and complementary to the masculine. Man became the measure of the human; woman, his difference.

The importance of this formulation for constitutional theory is significant. If the universal subject of law was constructed on the basis of the masculine experience, then apparently neutral legal categories come to reflect masculine values, interests and perspectives. Constitutional neutrality thus reveals itself to be an apparent neutrality.

This critique has particular relevance for understanding reproductive autonomy. The historical construction of woman as the “Other” was directly associated with her identification with motherhood and with reproductive functions. Reproduction was frequently presented not as a possibility of personal fulfilment, but as an obligatory social destiny. Women’s autonomy over their own bodies remained conditioned by collective expectations relating to the family, morality and the preservation of particular social models.

From the perspective inaugurated by Beauvoir, the constitutional recognition of reproductive self-determination represents an indispensable condition for overcoming this logic of otherness. Only when women are recognised as full subjects of rights, capable of deciding autonomously about their existential projects, does it become possible to give effect to the constitutional ideals of liberty, equality and human dignity.

2.3 CATHARINE MACKINNON AND THE CRITIQUE OF STATE NEUTRALITY

The reflections developed by Simone de Beauvoir find important deepening in the work of Catharine MacKinnon. Unlike Beauvoir, whose analysis focuses on the processes of the social construction of inequality, MacKinnon directs her critique at the functioning of legal and political institutions.

In *Toward a Feminist Theory of the State* (1989), the author maintains that the liberal State is not neutral. On the contrary, its normative structures were historically constructed from the masculine perspective and contribute to the reproduction of relations of gender domination. Law does not merely reflect pre-existing social inequalities; it actively participates in their maintenance.

According to MacKinnon, the formal equality promoted by liberal constitutionalism proves insufficient because it ignores the concrete conditions of subordination that affect women. The mere abstract attribution of rights does not eliminate the historical relations of power that limit the effective exercise of liberty and autonomy.

This critique has profound implications for understanding reproductive rights. The legal regulation of sexuality, motherhood and reproduction is frequently presented as the protection of collective interests or universal values. Feminist analysis, however, shows that such normative choices bear disproportionately on female bodies, restricting spaces of autonomy and reinforcing patriarchal structures.

MacKinnon's contribution makes it possible to understand that reproductive self-determination cannot be analysed exclusively from the standpoint of individual liberty. It is also a matter relating to the distribution of power in societies historically marked by gender inequalities. The recognition of reproductive autonomy therefore represents an instrument for the promotion of substantive equality and for confronting the institutional forms of women's subordination.

3 INTERSECTIONALITY, PERFORMATIVITY AND CONSTITUTIONAL RECONSTRUCTION

3.1 KIMBERLÉ CRENSHAW AND THE CRITIQUE OF THE UNIVERSALISATION OF WOMEN'S EXPERIENCE

The development of contemporary feminist constitutionalism was profoundly influenced by the theory of intersectionality formulated by Kimberlé Crenshaw. In analysing the situation of Black women in the United States, the author demonstrated that traditional models for combating discrimination were incapable of understanding experiences marked by the overlapping of multiple systems of oppression.

The main contribution of intersectionality consists in showing that gender, race, social class, sexual orientation and other social markers do not operate in isolation. On the contrary, they interact simultaneously, producing specific forms of exclusion that cannot be understood through fragmented analyses.

The critique formulated by Crenshaw is directed both at traditional anti-discrimination law and at certain feminist currents that universalised the experience of white middle-class women as the paradigm of the feminine condition. By ignoring differences internal to the group of women itself, these approaches ended up rendering invisible specific forms of oppression experienced by historically marginalised groups.

In the field of reproductive rights, intersectionality reveals that the obstacles to the exercise of bodily autonomy are not distributed uniformly. Black, poor, Indigenous, migrant women and women belonging to vulnerabilised groups frequently face significantly more severe barriers to accessing health services, information and the means necessary for the exercise of their reproductive rights.

The theory of intersectionality broadens the scope of feminist constitutionalism by requiring that the protection of fundamental rights be constructed on the basis of the plurality of women's experiences. Constitutional equality ceases to be conceived as mere uniform treatment and comes to require the recognition of the differences and structural inequalities that affect particular social groups.

3.2 JUDITH BUTLER AND THE DECONSTRUCTION OF NORMATIVE IDENTITIES

The feminist critique of traditional gender structures reaches a new level with the work of Judith Butler. In *Gender Trouble* (1990), the author questions essentialist conceptions of identity and develops the theory of gender performativity.

According to Butler, gender identities do not constitute natural or biologically determined realities. They are produced and reproduced by reiterated social practices that establish normative expectations about individuals. Gender does not precede experience; it is continuously constructed through discourses, institutions and social practices.

This perspective has important implications for constitutional theory. By demonstrating that apparently natural categories are, in reality, historical and cultural constructions, Butler highlights the need to revise legal models founded on rigid and binary conceptions of human identity.

In the sphere of reproductive self-determination, the theory of performativity makes it possible to understand that the legal control of reproduction is frequently associated with the imposition of particular social roles on women. Motherhood ceases to be understood merely as an individual choice and comes to be analysed as a social expectation produced by normative structures that associate femininity with reproduction.

Consequently, the constitutional protection of reproductive autonomy requires not only the formal recognition of rights, but also the deconstruction of normative patterns that condition women's choices and limit their possibilities of self-determination.

3.3 MARTHA NUSSBAUM AND THE CAPABILITIES APPROACH

The feminist reconstruction of the constitutional categories of liberty and equality finds an important normative foundation in the capabilities approach developed by Martha Nussbaum.

Distancing herself from strictly formal conceptions of justice, Nussbaum proposes a model oriented towards the effective promotion of the conditions necessary for each individual to develop their human potential fully. The author maintains that human dignity

requires more than the mere abstract holding of rights. It is necessary that people have real conditions to make meaningful choices relating to their life projects.

Among the capabilities considered fundamental by the author, bodily health, physical integrity, practical autonomy and freedom of choice in reproductive matters stand out. These capabilities constitute indispensable prerequisites for human flourishing and for the effective exercise of citizenship.

The relevance of this formulation for feminist constitutionalism lies in overcoming the traditional understanding of liberty as the mere absence of state interference. Liberty comes to be understood as the effective possibility of acting, deciding and autonomously constructing one's own life project.

From this perspective, reproductive self-determination is not limited to the formal recognition of the right of choice. It requires material conditions that allow women to exercise such a choice in a free, informed and responsible manner. Economic, social and cultural barriers can render illusory a formally guaranteed liberty, which is why the constitutional protection of reproductive rights also demands public policies oriented towards the promotion of substantive equality.

4 FEMINIST CONSTITUTIONALISM AND REPRODUCTIVE SELF-DETERMINATION

The theoretical contributions examined above converge on a central question: the need to reconstruct the traditional constitutional categories on the basis of women's concrete experiences. It is precisely in this context that the relationship between feminist constitutionalism and reproductive self-determination emerges.

Historically, legal systems exercised significant control over female sexuality, motherhood and reproduction. Women's reproductive capacity was frequently treated as an object of state, religious or moral regulation, limiting spaces of individual autonomy and making life projects conditional upon previously established expectations.

Feminist constitutionalism shows that such limitations cannot be understood as mere neutral legislative options. They reflect historical structures of power that associated feminine identity with motherhood and attributed to women specific social functions relating to reproduction and care.

In this scenario, reproductive self-determination arises as a constitutional category intended to protect women's capacity to decide about fundamental aspects of their existence. It is the prerogative to decide, in a free, informed and responsible manner, on questions relating to sexuality, contraception, motherhood, assisted reproduction and other dimensions of reproductive life.

4.1 REPRODUCTIVE SELF-DETERMINATION AS AN IMPLICIT FUNDAMENTAL RIGHT

The discussion developed thus far makes it possible to advance towards a central question: does reproductive self-determination constitute merely a doctrinal construction, or can it be recognised as a genuine fundamental right in contemporary constitutionalism? The answer proposed in this work is affirmative.

Although the 1988 Constitution of the Federative Republic of Brazil does not expressly mention the expression “reproductive self-determination”, the absence of a specific textual provision does not preclude its constitutional recognition. On the contrary, the very logic of contemporary constitutionalism admits the existence of implicit fundamental rights derived from the structuring principles of the constitutional order.

The clause of material openness set out in Article 5, § 2, of the Federal Constitution establishes that the rights and guarantees expressly provided for in the constitutional text do not exclude others derived from the regime and the principles it adopts. This provision makes it possible to recognise fundamental rights that are not expressly enumerated, provided that they can be drawn from the axiological structure of the Constitution.

In this context, reproductive self-determination finds its foundation, in the first place, in human dignity, enshrined in Article 1, item III, of the Federal Constitution. Dignity presupposes the recognition of each individual as an autonomous moral subject, capable of defining the fundamental course of their own existence. Decisions relating to sexuality, motherhood, family planning and reproduction fall within the most intimate core of personal autonomy, which is why they cannot be reduced to mere objects of state protection or of heteronomous moral impositions.

In the second place, reproductive self-determination derives from the principle of liberty. Constitutional liberty is not limited to the absence of physical or legal coercion, equally encompassing the possibility of autonomously constructing one’s own life projects. From this perspective, the choice to have children, not to have them, to resort to techniques of assisted reproduction or to exercise other faculties relating to reproductive life forms part of the sphere of constitutionally protected existential liberty.

Substantive equality also constitutes an indispensable foundation for the recognition of reproductive autonomy. Historically, the legal and social control of reproduction bore predominantly on female bodies, producing specific restrictions on women’s liberty. Consequently, giving effect to equality requires the recognition of spaces of autonomy capable of neutralising structural mechanisms of gender subordination.

In addition, family planning, expressly provided for in Article 226, § 7, of the Federal Constitution, offers important normative support for the recognition of reproductive self-

determination. By establishing that family planning constitutes the free decision of the couple, prohibiting any coercive form on the part of official or private institutions, the constituent power incorporated into the constitutional text the idea of reproductive liberty as a legally protected value.

Reproductive self-determination also finds support in the rights to health, to intimacy and to private life, all directly related to the protection of bodily autonomy and the individual sphere of decision. It is, therefore, a right that emerges from the systematic interpretation of the Constitution, articulating multiple fundamental principles and guarantees.

Luigi Ferrajoli's guarantist theory reinforces this understanding by maintaining that fundamental rights constitute limits on the arbitrary exercise of power and instruments for the protection of individual autonomy. From this perspective, the constitutional protection of reproductive self-determination does not represent a mere state concession, but a guarantee intended to ensure spaces of liberty indispensable to the development of the human personality.

From the standpoint of feminist constitutionalism, this recognition acquires an even deeper significance. Reproductive autonomy represents not only a manifestation of individual liberty, but also an instrument for confronting the historical structures that made female citizenship conditional upon the control of sexuality and motherhood. For this reason, reproductive self-determination must be understood as a genuine implicit fundamental right, indispensable to giving effect to the human dignity, substantive equality and existential liberty of women.

5 BRAZILIAN AND ITALIAN PERSPECTIVES ON FEMINIST CONSTITUTIONALISM

5.1 BRAZILIAN FEMINIST CONSTITUTIONALISM

In the Brazilian context, feminist constitutionalism has consolidated itself as an important field of academic production and constitutional critique, especially after the promulgation of the 1988 Constitution. The incorporation of the principles of human dignity, equality and non-discrimination allowed the development of new constitutional readings oriented towards overcoming historical structures of exclusion.

The work *Constitucionalismo Feminista*, coordinated by Christine Peter, Estefânia Barboza, Melina Girardi Fachin and Bruna Nowak, represents a fundamental milestone of this movement. The authors demonstrate that traditional constitutional theory was constructed on the basis of masculine paradigms, producing structural exclusions and rendering invisible women's experiences in the spaces of normative production and constitutional interpretation.

From this perspective, Brazilian feminist constitutionalism is not limited to the formal inclusion of women in the legal system. Its aim is to promote a hermeneutic reconstruction of the classical constitutional categories, incorporating the gender perspective as an indispensable element for understanding fundamental rights.

Bodily autonomy and reproductive rights occupy a central position in this process. The recognition of women as full subjects of rights requires that decisions relating to sexuality, motherhood and reproduction be analysed in the light of human dignity, substantive equality and existential liberty.

5.2 ITALIAN FEMINIST CONSTITUTIONALISM

The Italian experience presents equally relevant contributions to the development of contemporary feminist constitutionalism. Italian doctrine has emphasised the need to confront critically the constitutional tradition founded on abstract conceptions of universality, demonstrating how the exclusion of women's experiences compromises the effectiveness of the constitutional principles of equality and dignity.

In this context, the production of Laura Ronchetti stands out, denouncing the rendering invisible of sexual difference in Italian legal science and proposing a rapprochement between constitutionalism and feminist thought. For the author, giving effect to the constitutional project requires confronting the structural inequalities that continue to limit women's liberty.

Ronchetti's reflection proves particularly relevant to the theme of reproductive self-determination. In critically analysing mechanisms of legal control over female reproduction, the author demonstrates that bodily autonomy constitutes an essential dimension of democratic citizenship and of substantive equality.

The contribution of Simone Penasa also deserves mention, especially in his analyses of medically assisted reproduction and surrogacy. His work highlights the need to interpret complex bio-legal questions on the basis of the fundamental rights involved, avoiding moralising reductions that obscure the centrality of individual autonomy and human dignity.

5.3 CONVERGENCES BETWEEN THE BRAZILIAN AND ITALIAN MODELS

Despite the historical, cultural and institutional differences existing between Brazil and Italy, the reflections produced in both contexts present important points of convergence.

In the first place, a common critique is observed of the figure of the abstract universal subject that marked the development of liberal constitutionalism. Both Brazilian and Italian doctrine show that the alleged neutrality of constitutional law frequently conceals masculine perspectives presented as universal.

In the second place, both models recognise the need to incorporate women's concrete experiences into constitutional interpretation. Equality ceases to be understood exclusively from a formal perspective and comes to require confronting the structural inequalities that limit female autonomy.

Finally, the two traditions converge in the understanding that reproductive self-determination forms part of the essential core of women's fundamental rights. Even though the legal orders adopt distinct solutions for specific questions, there is a growing recognition of the need to protect bodily autonomy constitutionally as a condition for giving effect to human dignity, liberty and substantive equality.

5.4 THE DIALOGUE BETWEEN FEMINIST CONSTITUTIONALISMS IN BRAZIL AND ITALY

The comparative analysis developed throughout this work shows that Brazil and Italy share similar challenges with regard to the constitutional protection of women's autonomy, although situated in distinct historical and institutional contexts.

Both countries adopt constitutional models strongly committed to human dignity, equality and the protection of fundamental rights. In both cases, however, giving effect to these principles continues to face obstacles relating to the persistence of patriarchal structures that influence the interpretation and application of law.

In Brazil, debates concerning the voluntary termination of pregnancy, family planning, assisted reproduction and sexual rights reveal permanent tensions between individual autonomy and moralising perspectives on reproduction. In Italy, controversies relating to the effectiveness of Law No. 194/1978, to conscientious objection and to the limitations imposed by Law No. 40/2004 demonstrate similar challenges regarding the effective guarantee of women's reproductive liberty.

In this scenario, feminist constitutionalism offers an important space for transnational dialogue. The Brazilian and Italian experiences demonstrate that the protection of women's fundamental rights does not depend exclusively on specific legislative solutions, but also on the construction of interpretative models capable of incorporating the gender perspective into constitutional hermeneutics.

The circulation of legal arguments, the doctrinal exchange and the dialogue between constitutional courts contribute to the formation of common parameters for the protection of bodily and reproductive autonomy. This is a process that strengthens the understanding of reproductive self-determination as an essential dimension of women's human rights and as an integral element of the contemporary democratic constitutional heritage.

6 CONCLUSION

The analysis developed throughout this article has made it possible to demonstrate that feminist constitutionalism represents one of the most relevant theoretical contributions to the renewal of contemporary constitutional thought. By questioning the alleged neutrality of classical liberal constitutionalism, feminist theory shows that fundamental categories such as liberty, equality and dignity were historically formulated on the basis of masculine reference points, producing mechanisms of exclusion that directly affected the legal condition of women.

The contributions of John Stuart Mill, Simone de Beauvoir, Catharine MacKinnon, Kimberlé Crenshaw, Judith Butler and Martha Nussbaum reveal a progressive process of broadening the feminist critique of law, making it possible to understand how legal and institutional structures participate in the reproduction of gender inequalities.

In this context, reproductive self-determination emerges as a privileged expression of the transformations promoted by feminist constitutionalism. More than a simple manifestation of individual liberty, it constitutes an essential dimension of human dignity, substantive equality and women's constitutional citizenship.

The analysis of the Brazilian and Italian experiences reinforces this conclusion by demonstrating that the incorporation of the gender perspective into constitutional interpretation represents an indispensable condition for giving effect to fundamental rights. In both contexts, the protection of reproductive autonomy proves to be a fundamental instrument for overcoming normative structures historically marked by patriarchy.

It is concluded, therefore, that feminist constitutionalism offers consistent theoretical foundations for the recognition of reproductive self-determination as an implicit fundamental right. By critically reconstructing the traditional constitutional categories, this perspective contributes to the consolidation of a constitutional order genuinely committed to the liberty, equality and dignity of all persons.

From this perspective, the constitutional recognition of reproductive self-determination does not represent the creation of a new right, but the unveiling of a guarantee already contained in the democratic constitutional order, the effectiveness of which remains conditional upon overcoming legal and social structures historically marked by gender inequality.

ABSTRACT

Credit cooperativism has been widely recognised as an instrument of financial inclusion and of the promotion of regional development. Given the growing scientific output on the subject, it becomes relevant to understand how the literature has addressed the relationship between credit cooperativism and regional development. In this context, this study aims to analyse the scientific output related to the theme by means of a systematic literature review. The search was carried out in national and international databases, covering studies that address credit cooperativism, financial inclusion and regional development. The results show that the literature focuses mainly on the analysis of the contribution of cooperatives to local development, the expansion of access to financial services and the strengthening of regional economies. A predominance of descriptive studies was also observed, as well as a geographical concentration of the research in regions where cooperativism presents a greater degree of institutional consolidation. As a contribution, the study systematises the knowledge produced on the subject and identifies gaps that may guide future research agendas.

Keywords: Credit Cooperativism. Regional Development. Financial Inclusion. Systematic Literature Review. Local Development.

RESUMO

O cooperativismo de crédito tem sido amplamente reconhecido como um instrumento de inclusão financeira e de promoção do desenvolvimento regional. Diante da crescente produção científica sobre o tema, torna-se relevante compreender como a literatura tem abordado a relação entre cooperativismo de crédito e desenvolvimento regional. Nesse contexto, este estudo tem como objetivo analisar a produção científica relacionada ao tema por meio de uma revisão sistemática da literatura. A busca foi realizada em bases de dados nacionais e internacionais, contemplando estudos que abordam cooperativismo de crédito, inclusão financeira e desenvolvimento regional. Os resultados evidenciam que a literatura concentra-se principalmente na análise da contribuição das cooperativas para o desenvolvimento local, ampliação do acesso aos serviços financeiros e fortalecimento das economias regionais. Observou-se ainda predominância de estudos descritivos e concentração geográfica das pesquisas em regiões onde o cooperativismo apresenta maior

1 INTRODUCTION

The Central Bank of Brazil (BCB, 2024) defines a Credit Cooperative as a financial institution formed by the association of people whose aim is to provide financial services exclusively to its members. In them, members find the main services available in banks, that is, current accounts, financial investments, credit cards, loans and financing.

The distinctive feature of credit cooperatives occurs when the cooperative's positive result, known as the surplus, is shared with the member in proportion to the financial operations carried out with the institution. The Central Bank of Brazil (BCB, 2025) further stresses that the member must also be prepared for a possible apportionment in the event of losses, which is likewise calculated according to the use of services.

Credit cooperativism in Brazil constitutes one of the most dynamic and structured segments of the national cooperative system. According to data from the Organisation of Brazilian Cooperatives (OCB, 2024), the country has more than 25 million members and more than 4,000 active cooperatives. The credit branch, in turn, accounts for more than 20 million members, that is, it is one of the largest fields of cooperativism in Brazil. Thus, credit cooperativism stands out as a strategic agent for the economic and social development of Brazil.

The expansion of credit cooperativism in recent decades has occurred unevenly across Brazilian regions. The South and South-east concentrate the largest number of cooperatives, assets and members, reflecting a historical process of institutional and economic consolidation of the sector. By contrast, the North and North-east present lower cooperative density and lower coverage of the financial services offered by these institutions (Schneider, 2015). This regional asymmetry has aroused growing academic interest, especially regarding the potential of credit cooperatives to promote financial inclusion, economic dynamisation and regional development.

Although the subject has aroused growing academic interest in recent decades, the scientific literature still presents important gaps regarding the understanding of the different territorial contexts in which credit cooperativism develops. In addition to the diversity of theoretical and methodological approaches, there is a need to broaden knowledge about the factors that condition the impacts of credit cooperatives on financial inclusion and regional development (Queiroz, Flach and Mattos, 2022).

Against this background, the following research question emerges: How has scientific output addressed the relationship between credit cooperativism and regional development?

Accordingly, this research aims to analyse, by means of a systematic literature review, how scientific output has addressed the relationship between credit cooperativism and

regional development, identifying the main themes investigated, the methodological approaches adopted, the results found and the gaps existing in the literature.

The relevance of this study lies in the systematisation of scientific output on credit cooperativism and regional development. Although the subject has aroused growing academic interest in recent decades, the literature is dispersed across different theoretical approaches, territorial contexts and methodological strategies. In this sense, conducting a systematic review makes it possible to organise the knowledge produced, to identify convergences and divergences between studies, and to highlight gaps still existing in the literature. Among these gaps, the lesser attention devoted to less-studied regions of the country, especially the North and North-east, stands out, reinforcing the need to broaden investigations into the activity of credit cooperatives in different regional contexts.

To achieve this objective, the article is organised into five sections. After this introduction, the theoretical framework on credit cooperativism and regional development is presented. Subsequently, the methodological procedures adopted are described. The main results of the literature review are then discussed and, finally, the study's final considerations are presented.

2 THEORETICAL FRAMEWORK

This section presents the theoretical framework that underpins the analysis of credit cooperativism and its relationship with regional development. Initially, the origin and evolution of credit cooperativism are discussed, highlighting its principles and institutional characteristics. Next, the main theories of regional development that help in understanding territorial inequalities and the role of cooperative organisations in the dynamisation of local economies are addressed. Finally, studies that analyse the activity of credit cooperatives in Brazil are presented, with emphasis on regional asymmetries and the challenges of expanding the model in regions less served by the traditional financial system.

2.1 CREDIT COOPERATIVISM

Credit cooperativism emerged in Brazil at the beginning of the twentieth century, inspired by European experiences of solidarity economy and financial inter-cooperation. Its genesis dates back to 1902, with the founding of the Rural Credit Cooperative of Nova Petrópolis, in Rio Grande do Sul, considered the first in Latin America (Pinho, 2004).

The adoption of cooperativism in Brazil was inspired by the Raiffeisen model (1864), whose characteristics, according to Pinho (2004), are founded on the Christian principle of love for one's neighbour, admit philanthropic assistance, attach great importance to the moral

formation of members—who become jointly and unlimitedly responsible for the obligations contracted by the cooperative—attach significant importance to organising the institution so as to meet the needs of the cooperatives, do not remunerate their directors and did not distribute returns. This first credit cooperative of Nova Petrópolis aimed to bring together small rural producers to offer mutual credit on accessible terms, strengthening the local economy and reducing dependence on traditional financial institutions.

The movement gained strength mainly in communities of German and Italian colonisation, where the culture of cooperation and self-management was already part of social and religious practices (Schneider, 2015). For decades, credit cooperativism remained strongly linked to the rural environment, acting as an instrument of financial inclusion and local development.

The institutionalisation of the sector occurred with the advent of Law No. 5,764 (Brazil, 1971), which defined the National Cooperativism Policy, establishing criteria for the constitution, operation and supervision of cooperatives. It established the legal framework of the Brazilian cooperative movement, consolidating the figure of the cooperative as an autonomous society of people united by common economic and social objectives, distinct from capital-based companies. Subsequently, the 1988 Federal Constitution, in its Article 5, item XVIII, reinforced freedom of association and the autonomy of cooperatives, guaranteeing legal certainty and legitimacy to their activity (Brazil, 1988).

In this regard, Martins (2022) observes that associative freedom in cooperatives must be understood as a right-guarantee, ensuring that individuals with common interests may organise collectively with autonomy and without state intervention. Constitutional recognition reinforces the democratic nature of cooperatives, distinguishing them from business companies and conferring on them reinforced protection within the legal order.

In the 1990s and 2000s, credit cooperativism underwent a process of restructuring and institutional expansion, with the strengthening of integrated systems such as the Cooperative Credit System (Sicredi), the System of Credit Cooperatives of Brazil (Sicoob) and the System of Rural Credit Cooperatives with Solidarity Interaction (Cresol), which broadened the capillarity and diversity of financial products offered to members (Manenti, 2021).

The regulation of the Central Bank of Brazil (BCB), especially after Resolution No. 4,434/2015, was decisive for the increase in the efficiency, transparency and competitiveness of these institutions.

It is important to stress that studies on the management of credit cooperatives indicate that the performance of these organisations depends on the capacity to reconcile administrative efficiency, member participation and financial sustainability. Porto (2002), in

proposing an evaluation model based on the *Balanced Scorecard* for rural credit cooperatives in the north of the country, stresses the importance of managerial instruments capable of aligning strategic objectives, institutional performance and the meeting of members' demands.

Currently, Brazilian credit cooperativism constitutes a relevant segment of the national financial system, being responsible for a portion of the credit operations in the country and showing growing expansion over recent years. According to the Central Bank of Brazil (BCB, 2024), credit cooperatives are present in about 55% of Brazilian municipalities, reaching localities frequently underserved by traditional banks.

In this sense, recent empirical evidence reinforces the role of credit cooperatives not only as instruments of financial inclusion, but also as agents of regional development. Cavinato and Capitani (2023), in analysing the social efficiency of rural credit cooperatives in Brazil from a regional perspective, identify that these institutions have a positive impact above all in less developed regions, contributing to the expansion of access to credit, the strengthening of local productive activities and the reduction of territorial inequalities. The results indicate that the activity of cooperatives goes beyond financial intermediation, assuming a relevant role in economic dynamisation and in the promotion of sustainable regional development.

Having understood the foundations and evolution of credit cooperativism, it becomes necessary to discuss its relationship with regional development, a theme addressed in the following section.

2.2 COOPERATIVISM AND REGIONAL DEVELOPMENT

Classical authors such as Perroux (1950), Myrdal (1957) and Hirschman (1958) emphasise that economic development occurs unevenly across territory, being driven by dynamic poles and cumulative processes.

As Vasconcelos and Leite (2004) emphasise, different classical contributions of the literature on regional development, such as those of Perroux (1950), Myrdal (1957) and Hirschman (1958), although formulated at distinct moments and under varied theoretical approaches, converge in recognising that economic development occurs in a spatially uneven manner, being driven by dynamic sectors and by processes of productive linkage.

The growth poles theory, proposed by Perroux (1950), became one of the main references of the literature on regional development; far from seeking to restrict his theory, this work will restrict the focus to the field of regional planning and development. The analysis is based on the idea that economic growth occurs in a spatially uneven manner, concentrating

in development poles formed by sectors or activities with greater capacity for economic dynamisation. From these poles, the effects of growth spread to other areas through productive linkages and structural transformations in the economy (Campos Junior, 2020).

From this perspective, the concept of pole refers to the presence of activities capable of exerting strong influence over other productive activities, generating effects of diffusion and economic linkage. Thus, development is understood as a process of structural transformation of the economy, marked by the emergence of new industries and by the replacement of less dynamic activities with innovative sectors.

Perroux's (1950) interpretation of the spatial concentration of economic growth dialogues with other classical approaches to regional development. Among them, the theory of circular cumulative causation proposed by Myrdal (1957) stands out, emphasising the tendency towards the concentration of development in certain regions. According to the author, economic processes generate effects that feed back over time, reinforcing already existing territorial inequalities: more developed regions tend to attract investment, infrastructure and human capital, while less favoured areas remain trapped in trajectories of relative stagnation. In this context, the concentration of productive activities can expand employment, income and the local consumer market, creating conditions for the attraction of new economic activities and intensifying the processes of regional polarisation (Oliveira and Teles, 2019; Ferreira and Salles, 2020).

Hirschman (1958), *apud* Vasconcelos and Leite (2004), argues that economic growth occurs in an unbalanced manner, being driven by strategic sectors capable of generating productive linkages. For the authors, these linkages may occur both forward (*forward linkages*), stimulating activities that use the products generated by a given sector, and backward (*backward linkages*), encouraging the emergence of suppliers and inputs necessary for production. Regional development, according to the authors, depends on the capacity of key sectors and regions to create these multiplier effects.

In this way, certain sectors or activities assume a strategic role in the dynamisation of regional economies, by stimulating the expansion of productive chains and generating multiplier effects on other segments of the economy. In this context, cooperatives can play a relevant role by articulating producers, consumers and markets, contributing to the strengthening of local productive chains. Thus, organisations capable of articulating economic agents and stimulating the formation of local productive chains can act as important catalysts of the processes of regional development described by Hirschman (1958).

Taken together, the classical approaches to regional development, represented by the contributions of Perroux (1950), Myrdal (1957) and Hirschman (1958), show that economic

growth has a strong spatial dimension and tends to occur unevenly across regions (Vasconcelos and Leite, 2004). In this context, understanding the mechanisms capable of promoting greater territorial balance becomes fundamental for the analysis of regional development strategies.

In the Brazilian case, these dynamics of concentration and diffusion of economic growth manifest themselves particularly clearly in the historical inequalities between the different regions of the country. Owing to asymmetries in infrastructure, human capital and access to opportunities, the inequalities are aggravated by the historical concentration of public and private investment in the South–South-east axis (Vargas-Chaves, 2021). For this author, human capital, understood as the technical and organisational qualification of the population, is a determining factor for the success of cooperatives, which depend on the training and engagement of their members in order to operate efficiently and sustainably.

In more recent approaches, it is perceived that endogenous territorial development emphasises the valorisation of local potential, participatory governance and institutional networks. Authors such as Putnam (1993) and Vázquez Barquero (2002) highlight the role of social capital, trust and cooperation in promoting sustainable development. For Putnam (1993), social capital, understood as the set of networks of trust, norms of reciprocity and civic participation, constitutes a fundamental element for the strengthening of institutions and for the coordination of collective actions at the local level. Vázquez Barquero (2002), in turn, emphasises that territorial development depends on the capacity of communities to mobilise their internal resources, articulate local actors and build collective strategies of economic growth.

In this context, Brazilian credit cooperatives configure themselves as instruments of territorial governance, by combining democratic management, community proximity and local reinvestment, elements that contribute to the strengthening of social and economic cohesion. This evidence demonstrates that the classical theories initially cited remain pertinent for interpreting Brazilian regional inequalities, especially when articulated with contemporary approaches of social capital and endogenous development (Putnam, 1993; Vázquez Barquero, 2002).

This theoretical basis guides the understanding of how cooperativism, especially credit cooperativism, operates in distinct socio-economic contexts, enhancing local dynamics of inclusive and sustainable growth. The main theoretical contributions that underpin the analysis of regional development and its relationship with credit cooperativism can be synthesised in Chart 1.

Table 1

Main theoretical approaches to regional development

Author	Theoretical contribution	Relationship with the study
Perroux (1950)	Growth poles theory	Explains the spatial concentration of economic activities
Myrdal (1957)	Circular cumulative causation	Highlights the reinforcement of regional inequalities
Hirschman (1958)	Productive linkages	Shows how strategic sectors dynamise economies
Putnam (1993)	Social capital	Highlights the role of trust and cooperation
Vázquez Barquero (2002)	Endogenous territorial development	Emphasises the importance of local dynamics and resources

Source: prepared by the authors based on the literature.

From this theoretical framework, it becomes possible to understand the potential of cooperativism as an instrument for promoting regional development. In the Brazilian case, however, the expansion of credit cooperatives presents an uneven territorial distribution, concentrating mainly in the South and South-east regions, which highlights the need to analyse their activity and the challenges of consolidation in other regions of the country.

2.3 CREDIT COOPERATIVES AND REGIONAL INEQUALITIES IN BRAZIL

The literature shows that, in regions with lower banking density, such as part of the Brazilian North, credit cooperatives can play a strategic role in financial inclusion and in the strengthening of local economies (Porto, 2020).

In Brazil, the cooperative movement evolved unevenly across regions. The South presents a high density of cooperatives per municipality, a robust institutional structure and high volumes of assets and revenue, while the North is still expanding its presence, especially in the agricultural and credit branches (Manenti, 2021). This regional heterogeneity has frequently been highlighted by the literature as an important element for understanding the different impacts of credit cooperatives on the economic and social development of territories.

Although the presence of credit cooperatives is more consolidated in the South and South-east regions, experiences observed in states of the North region demonstrate the potential of these institutions to promote financial inclusion and to support local economic activities. In this sense, Porto (2002), in studying a rural credit cooperative in Rondônia, shows the importance of these organisations for the strengthening of regional economies.

Thus, the effects of cooperativism go beyond the financial sphere, by strengthening relationships of cooperation, social participation and territorial development. From this perspective, cooperatives can be understood not only as financial organisations, but also as

institutions capable of promoting inclusion and local development (Singer, 2002; Oliveira, 2013).

Against this background, the presence of credit cooperatives may represent a relevant alternative for broadening access to financial services in regions historically less served by the traditional banking system. In this sense, these institutions can contribute to the mobilisation of local resources, the strengthening of productive activities and economic dynamisation in different territories.

The literature analysed shows that the territorial distribution of credit cooperatives in Brazil remains marked by significant regional inequalities. Although several studies point to the contributions of these institutions to financial inclusion and local economic development, a concentration of the research in regions where cooperativism is already more consolidated is observed. This finding reinforces the importance of systematic reviews capable of identifying patterns, convergences and gaps in the scientific output on credit cooperativism and regional development.

The set of theoretical contributions presented makes it possible to understand credit cooperativism as a potential agent of financial inclusion and of dynamisation of local economies. On the basis of this theoretical framework, the next section describes the methodological procedures adopted in conducting the systematic literature review.

3 RESEARCH METHOD

This research is characterised as a systematic literature review, conducted with the aim of identifying, selecting and analysing scientific studies related to credit cooperativism and regional development. The review was structured on the basis of the recommendations of Snyder (2019) and the guidelines of the PRISMA protocol, seeking to ensure transparency, methodological rigour and traceability of the study-selection process.

The search was carried out in the Web of Science, Scopus, SciELO and SPELL databases, selected for their relevance in indexing national and international studies in the areas of Administration, Economics and Regional Development. To retrieve the works, combinations of descriptors related to credit cooperativism and regional development were used, employing Boolean operators (*AND* and *OR*). Among the combinations used, expressions such as “credit cooperatives” *AND* “regional development” stand out, as well as variations involving the terms “credit cooperativism”, “local development”, “credit cooperatives” and “regional development”.

The following inclusion criteria were adopted: (i) scientific articles published in peer-reviewed journals; (ii) studies related to credit cooperativism and regional development; (iii)

publications in the period from 2015 to 2025; and (iv) availability of the full text. As exclusion criteria, duplicate works, studies without adherence to the theme and publications outside the scope of the research were considered. In order to make the protocol adopted in the systematic review more transparent, Chart 2 presents a synthesis of the main methodological stages of the research.

Table 2

Systematic review protocol

Stage	Procedure adopted
Research question	How has scientific output addressed the relationship between credit cooperativism and regional development?
Databases consulted	Web of Science, Scopus, SciELO and Spell
Period analysed	2015–2025
Inclusion criteria	Peer-reviewed articles, relevant to the theme and available in full
Exclusion criteria	Duplicates, out of scope or without thematic relevance
Studies identified	59
Studies after screening	53
Final studies analysed	15
Analysis technique	Thematic synthesis

Source: prepared by the authors based on the literature.

As presented in Chart 2, the review was conducted on the basis of previously defined criteria, covering the selection of the databases, the inclusion and exclusion criteria, as well as the procedures for analysing the studies. The adoption of this protocol sought to ensure greater methodological consistency and transparency in the literature-selection process.

The selection process took place in successive stages. Initially, the titles and abstracts of the studies retrieved from the databases were analysed. Subsequently, the works potentially adhering to the research objective were submitted to full reading in order to verify eligibility. Studies that did not directly address the relationship between credit cooperativism and regional development were excluded, as were works focused on other segments of cooperativism or on non-cooperative financial institutions.

The search resulted in 59 articles, distributed across the Web of Science (9), Scopus (5), SciELO (5) and SPELL (40) databases. After the removal of duplicates, 53 records remained, which were submitted to screening by title and abstract. Of these, 38 were excluded for not meeting the eligibility criteria. In the end, 15 studies were selected for full reading and included in the final analysis. No additional exclusions were identified at the full-reading stage. The final studies constituted the analytical corpus of the present systematic review.

Data analysis was carried out by means of thematic synthesis, a technique widely used in systematic reviews to identify recurrent patterns in the literature. Initially, the selected studies were read in full and analysed with regard to their objectives, methods and main results. Next, the findings were grouped according to their thematic proximity, allowing the construction of emerging analytical categories. This process resulted in the definition of three central axes of analysis: (i) credit cooperativism and financial inclusion; (ii) cooperativism and regional development; and (iii) gaps and challenges in the literature on credit cooperativism and regional development. The categorisation was carried out inductively, on the basis of the recurrent themes identified in the selected studies.

For the purposes of data extraction and organisation, information was recorded relating to the authors, year of publication, geographical context analysed, methodological approach and main results of the selected studies. This information supported the construction of the synthesis charts and the identification of the thematic patterns discussed in the results section.

The adoption of a systematic strategy for searching and selecting the studies aims to ensure greater methodological rigour, transparency and reproducibility of the research, reducing biases in the selection of the literature. In addition, the use of analytical categories contributed to the organisation and interpretation of the results, favouring a more structured understanding of the scientific output on the subject.

The study-selection process followed the guidelines of the PRISMA protocol, as illustrated in Figure 1.

Figure 1

Study selection flow according to the PRISMA protocol

Source: prepared by the author (2025).

It is worth noting that, although the total number of studies identified is not high, greater thematic adherence was observed in the additional databases, which contributed to the increase in the number of studies eligible for analysis.

4 ANALYSIS OF RESULTS

The analysis of the literature made it possible to identify different approaches to the role of credit cooperativism in regional development. Of the studies initially identified, some were excluded for not presenting direct adherence to the research object, such as works focused on other sectors or that addressed the banking system in general, without a specific focus on credit cooperatives.

From the selected studies, it is observed that the literature on credit cooperatives and regional development presents a predominance of empirical approaches, with different geographical and methodological scopes. In general, there is convergence regarding the contribution of these institutions to financial inclusion, local economic dynamisation and the strengthening of regional development, although the results are not uniform across all the contexts analysed.

On the basis of the thematic synthesis of the selected studies, the results were organised into three analytical axes: (i) credit cooperativism and financial inclusion; (ii)

cooperativism and regional development; and (iii) gaps and challenges in the literature on credit cooperativism and regional development.

4.1 CREDIT COOPERATIVISM AND FINANCIAL INCLUSION

With regard to financial inclusion, the literature shows that credit cooperatives play a relevant role in broadening access to financial services, especially in regions characterised by a lesser presence of the traditional banking system. Unlike conventional financial institutions, cooperatives operate on the basis of principles of proximity, mutualism and member participation, which favours the provision of financial services adapted to local needs (Barros et al., 2020).

In this context, the activity of credit cooperatives contributes to the reduction of market failures associated with financial exclusion, particularly in serving small producers, micro-entrepreneurs and lower-income populations, segments frequently neglected by traditional banking institutions. As Singer (2002) and Vázquez Barquero (2002) point out, economic organisation based on collective and territorially rooted structures tends to promote greater financial inclusion in territorially specific contexts.

The studies analysed converge in indicating that financial inclusion constitutes one of the main mechanisms through which credit cooperatives contribute to regional development. In different contexts, the results indicate that these institutions broaden access to credit and financial services for groups traditionally excluded from the conventional financial system, especially small rural producers, micro-entrepreneurs and populations located in smaller municipalities.

In the Brazilian case, data from the Central Bank of Brazil (BCB, 2024) indicate that credit cooperatives are present in approximately 55% of municipalities, which shows their high territorial capillarity. This presence is particularly relevant in localities underserved by traditional banks, reinforcing their role as an instrument of financial inclusion in peripheral regions with lesser access to formal financial services.

Convergence between the studies is also observed regarding the positive effects of the presence of cooperatives on financial inclusion. However, the research differs as to the explanatory mechanisms of these results. While some authors emphasise territorial proximity and knowledge of local realities, others highlight aspects related to cooperative governance, member participation and the capacity of cooperatives to adapt their services to the specific demands of the communities served.

In this way, the literature converges in pointing out that credit cooperativism acts as a relevant mechanism of financial inclusion, but also of the broadening of access to financial

services in a more equitable manner among different social groups. This activity proves particularly relevant in contexts characterised by a lesser supply of formal financial services, in which cooperatives can contribute to broadening access to credit and to strengthening processes of local and regional development.

4.2 COOPERATIVISM AND REGIONAL DEVELOPMENT

In the field of regional development, credit cooperatives are frequently associated with processes of local economic dynamisation. The literature points out that these organisations act as instruments for strengthening regional economies, by promoting the circulation of resources within the communities themselves (Singer, 2002; Vázquez Barquero, 2002; Barros et al., 2020).

Although the literature recognises the potential of credit cooperatives to drive regional development, the results observed vary according to the economic, institutional and territorial contexts analysed. In general, the studies identify positive effects related to income generation, job creation, the strengthening of local productive activities and the broadening of financial inclusion. Chart 3 presents a synthesis of the main studies identified in the systematic review.

Table 3

Synthesis of the studies on credit cooperatives and regional development

Author/Year	Main results
Queiroz et al. (2022)	Low scientific output and concentration of authors
Cavinato; Capitani (2023)	Credit cooperatives show greater impact in less developed regions
Jacques; Oliveira (2016)	The presence of cooperatives is associated with increased income in municipalities
Schuntzemberger et al. (2015)	The presence of cooperatives is associated with improved local economic indicators
Silva Filho; Silva (2025)	Expansion of cooperatives associated with increased credit, income generation and local development
Souza et al. (2023)	Cooperatives promote financial inclusion and income generation
Rovani et al. (2020)	Cooperatives contribute to job creation
Greatti; Sela (2021)	Cooperatives broaden financial inclusion and act as instruments of local development

Source: prepared by the author based on the analysed literature (2025).

The analysis of the studies synthesised in Chart 3 reveals a predominance of evidence favourable to the contribution of credit cooperatives to regional development. The most recurrent results relate to the broadening of access to credit, income generation, the strengthening of local productive activities, financial inclusion and the economic dynamisation

of territories. It is also observed that the identified impacts tend to be more pronounced in contexts characterised by lower economic development or a lesser presence of the traditional financial system, reinforcing the potential of cooperatives as instruments of local development.

In the Brazilian context, the studies of Jacques and Oliveira (2016), Schuntzemberger et al. (2015), Souza et al. (2023), Rovani et al. (2020), Greatti and Sela (2021) and Silva Filho and Silva (2025) point to convergent results regarding the contribution of cooperatives to regional development. The evidence found associates the presence of these institutions with increased municipal income, job creation, the broadening of the supply of credit and the strengthening of local economies.

Similar results are also observed in international studies. Research carried out in Spain (Alcaraz et al., 2021a; Alcaraz et al., 2021b; Giagnocavo, 2020) identifies contributions of cooperatives to territorial development and to the strengthening of local economies. In Italy, Agostino et al. (2022) and Aiello and Bonanno (2016) verified positive relationships between credit cooperativism, regional economic dynamics and business creation. Similarly, Moreno and Ávila (2021), in analysing Eurozone countries, observed that cooperatives contribute to the reduction of income inequalities and to the broadening of financial inclusion.

However, the effects of credit cooperatives on regional development are not consensual in the literature. Korzeb et al. (2019) identified contexts in which the presence of these institutions did not present a statistically significant relationship with certain local development indicators. These results suggest that the impacts of cooperativism depend on the specific characteristics of the territories analysed, as well as on institutional, economic and social factors that condition their activity.

In addition to the empirical evidence identified, the literature presents important limitations. As observed by Queiroz, Flach and Mattos (2022), the scientific output on credit cooperativism and regional development is still characterised by relative thematic dispersion and concentration of authors. Additionally, a geographical concentration of the research in European countries and in Brazilian regions where cooperativism presents a greater degree of institutional consolidation is observed. Such a characteristic shows the need to broaden studies in less explored contexts, as well as to develop methodological approaches capable of more robustly assessing the impacts of cooperatives on regional development indicators.

4.3 GAPS AND CHALLENGES IN THE LITERATURE ON CREDIT COOPERATIVISM AND REGIONAL DEVELOPMENT

The analysis of the selected studies made it possible to identify important gaps in the literature on credit cooperativism and regional development. Although the results point, in general, to positive contributions of cooperatives to financial inclusion, the strengthening of local economies and the dynamisation of productive activities, a thematic and geographical concentration of the research in specific contexts is observed, limiting the generalisation of the results.

One of the main gaps identified relates to the regional distribution of the studies. Most of the research concentrates in regions where credit cooperativism presents a greater degree of institutional consolidation, especially in the South and South-east regions of Brazil and in European countries. In contrast, regions such as the North and North-east remain relatively underexplored by the literature, despite presenting characteristics that make the investigation of the role of cooperatives in promoting financial inclusion and regional development particularly relevant.

These findings are consistent with empirical evidence from the literature, which points to the role of credit cooperatives in promoting regional development, especially in less favoured contexts. Studies indicate that these institutions have a greater impact in less developed regions, contributing to the reduction of territorial inequalities (Cavinato; Capitani, 2023). In addition, there is evidence of positive effects on local economic indicators, such as the income of Brazilian municipalities, reinforcing their activity as inducers of regional economic development (Jacques; Oliveira, 2016). In line with these results, analyses with a quasi-experimental approach also identify a positive impact of the presence of cooperatives on the agricultural GDP per capita, showing their contribution to local economic growth (Schuntzenberger et al., 2015).

This regional inequality can be understood in the light of structural factors, such as lower banking density, logistical difficulties, population dispersion and a lower level of productive organisation in regions such as the North. In this context, the lesser presence of credit cooperatives not only reflects these limitations, but also contributes to the maintenance of restrictions on access to formal financial services.

On the other hand, this scenario shows the strategic potential of credit cooperativism as a mechanism for promoting regional development. In regions less served by the traditional financial system, the expansion of these institutions can contribute to broadening access to credit, fostering local productive activities and strengthening regional economies, especially in contexts of greater economic vulnerability (Barros *et al.*, 2020).

Thus, the analysis of the literature shows important knowledge gaps regarding credit cooperativism and regional development, reinforcing the need to broaden research in less explored regions and to use more robust methodological approaches.

5 FINAL CONSIDERATIONS

This study aimed to analyse how scientific output has addressed the relationship between credit cooperativism and regional development, by means of a systematic literature review. The analysis of the selected studies made it possible to identify the main themes investigated, the predominant methodological approaches, the results found and the gaps present in the scientific output on the subject.

The literature analysed highlights that credit cooperatives play a relevant role in broadening access to credit, in the mobilisation of local resources and in the strengthening of regional economies. By operating on the basis of principles of cooperation, democratic participation and community reinvestment, these organisations contribute to the generation of social capital and to the promotion of more inclusive economic dynamics.

The review showed that the literature tends to associate credit cooperatives with positive effects on financial inclusion, local economic dynamisation and the strengthening of regional economies. However, the results are not homogeneous, since some studies point out that the impacts of these institutions depend on specific institutional, economic and territorial factors.

As limitations of this study, the fact that the analysis was based exclusively on a literature review stands out, not covering the empirical analysis of economic or performance indicators of cooperatives in the different regions of the country. In this sense, future research may broaden the use of quantitative methods, comparative analyses between regions and longitudinal studies capable of deepening the understanding of the impacts of credit cooperatives on regional development.

By systematising the literature on credit cooperativism and regional development, this study contributes to highlighting the relevance of these institutions in promoting financial inclusion and in reducing territorial inequalities in the Brazilian context.

Finally, it is hoped that this study contributes to the advancement of academic discussions on credit cooperativism and regional development, offering a systematised view of the existing scientific output and identifying opportunities for the development of new research agendas. By highlighting convergences, divergences and gaps in the literature, the research provides input for future investigations and for the improvement of the debate on the role of credit cooperatives in the economic and social development of territories.

ABSTRACT

Considering that the digitalization of the Brazilian Judiciary turns participation in digital environments into a requirement for engaging with the legal system and makes digital inclusion a constitutive dimension of the right of access to justice, this study aims to analyze the national landscape of implementation of the Digital Inclusion Points in the state Courts of Justice, considering their normative foundations, institutional structure and territorial distribution. To this end, a qualitative, descriptive-analytical approach is adopted, based on documentary analysis of normative acts, ordinances, resolutions, institutional programmes and data from the Courts of Justice and the National Council of Justice. Thus, a marked heterogeneity in implementation is observed, with courts at different stages of institutionalization and territorial reach, a variation that stems less from economic factors and more from institutional arrangements, organizational strategies and degrees of policy prioritization. This allows the conclusion that the Digital Inclusion Points may either reduce or reproduce structural inequalities in access to digital justice, so that their effectiveness depends on the articulation between infrastructure, technical support and territorial reach, rather than on normative provision alone.

Keywords: Access to Justice. Digital Inclusion. Digital Justice. Judiciary. Public Policy.

RESUMO

Considerando que a digitalização do Poder Judiciário brasileiro transforma a inserção em ambientes digitais em requisito de participação no sistema jurídico e faz da inclusão digital uma dimensão constitutiva do direito de acesso à justiça, objetiva-se analisar o cenário nacional de implementação dos Pontos de Inclusão Digital nos Tribunais de Justiça estaduais, considerando seus fundamentos normativos, sua estrutura institucional e sua distribuição territorial. Para tanto, procede-se à abordagem qualitativa, de caráter descritivo-analítico, com análise documental de atos normativos, portarias, resoluções, programas institucionais e dados dos Tribunais de Justiça e do Conselho Nacional de Justiça. Desse modo, observa-se acentuada heterogeneidade na implementação, com tribunais em diferentes estágios de institucionalização e capilaridade, variação que decorre menos de

RESUMEN

Considerando que la digitalización del Poder Judicial brasileño convierte la inserción en entornos digitales en un requisito de participación en el sistema jurídico y hace de la inclusión digital una dimensión constitutiva del derecho de acceso a la justicia, se objetiva analizar el escenario nacional de implementación de los Puntos de Inclusión Digital en los Tribunales de Justicia estaduais, considerando sus fundamentos normativos, su estructura institucional y su distribución territorial. Para ello, se procede a un enfoque cualitativo, de carácter descriptivo-analítico, con análisis documental de actos normativos, ordenanzas, resoluciones, programas institucionales y datos de los Tribunales de Justicia y del Consejo Nacional de Justicia. De esta manera, se observa una acentuada heterogeneidad en la implementación, con tribunales en diferentes etapas de institucionalización y capilaridad, variación que deriva menos de factores económicos y más de arreglos institucionales, estrategias organizativas y grados de priorización de la política. Esto permite concluir que los Puntos de Inclusión Digital pueden tanto reducir como reproducir desigualdades estructurales en el acceso a la justicia digital, de modo que su efectividad depende de la articulación entre infraestructura, soporte técnico e inserción territorial, y no solo de su previsión normativa.

1 INTRODUCTION

The digitalization of the Brazilian Judiciary constitutes one of the most significant processes of institutional transformation of recent decades, by shifting the provision of justice into digital environments and redefining the conditions of access and participation. In the legal field, this movement materializes in the consolidation of a model of digital justice, structured on the basis of normative frameworks such as Lei nº 11.419/2006 and institutional policies conducted by the Conselho Nacional de Justiça (CNJ), which guide the digitalization of judicial services in the name of efficiency, celerity and the broadening of access.

However, the digitalization of the Judiciary does not take place within a homogeneous social context. The incorporation of technologies as compulsory mediation for access to justice introduces new requirements of participation, related to the availability of technological infrastructure and the mastery of digital practices. In a country marked by structural inequalities in access to the internet and to electronic devices, this process tends to produce contradictory effects, expanding institutional capacity while at the same time restricting access for certain social groups.

The literature on access to justice allows this tension to be understood. Cappelletti and Garth (1988) demonstrate that effective access to rights depends on overcoming economic, social and cultural barriers. In the contemporary context, these barriers also assume a technological dimension, insofar as access to the justice system comes to depend on insertion into digital environments. Digital exclusion, in this scenario, emerges as a specific form of legal exclusion, compromising material equality between subjects.

In this context, digital inclusion becomes a central legal problem, since it conditions the exercise of fundamental rights. Digitalization, by becoming necessary mediation, redefines the criteria of access to jurisdiction, requiring the formulation of public policies capable of confronting the inequalities that pervade access to technologies. The absence of such policies tends to produce a more efficient system for those who already have access, while at the same time excluding those who do not have the necessary conditions to participate.

It is in this scenario that the Digital Inclusion Points are situated, instituted by Resolução nº 508/2023 of the CNJ (Conselho Nacional de Justiça, 2023) as a strategy aimed at mediating inequalities in access to digital justice. These spaces seek to guarantee minimum material conditions for participation in the judicial system, through the provision of technological infrastructure and technical support. The creation of the Digital Inclusion Points therefore represents an institutional response to the contradictions produced by the digitalization process.

From this context, the present article is guided by the following research question: how is the Brazilian landscape of implementation of the Digital Inclusion Points in the Courts of Justice configured, and what are its implications for access to justice in a context of digital inequality? This question makes it possible to articulate the empirical analysis of the public policy with the theoretical reflection on the conditions of access to the justice system in the digital environment.

The general objective of the article is to analyze the national landscape of implementation of the Digital Inclusion Points in the state Courts of Justice, considering their normative foundations, institutional structure and territorial distribution. Specifically, it seeks to understand, on the basis of empirical data, how the policy is operationalized across the Brazilian territory, identifying its advances, limits and inequalities. The premise is that the variation observed between courts stems less from structural variables, such as economic capacity or regional development, and more from different institutional arrangements, organizational strategies and degrees of policy prioritization within each judicial structure.

The text is organized into sections that articulate the theoretical framework, the methodology, the results and the discussion. Initially, the digitalization of the Judiciary and the emergence of digital inclusion as a legal problem are discussed, situating the debate within the theoretical field, as well as the Digital Inclusion Points as a public policy. Subsequently, the methodological path is described. Finally, the national overview of the implementation of the policy is presented, based on empirical data from the Courts of Justice, followed by the concluding remarks.

2 THEORETICAL FRAMEWORK

The digitalization of the Brazilian Judiciary is part of a broader process of restructuring the forms of State action, in which the incorporation of information and communication technologies redefines the modes of providing justice. In the legal field, this transformation shifts practices historically anchored in physical presence into environments mediated by digital platforms, altering the materiality of access to justice. This shift operates not only at the technical level, but redefines the concrete conditions of participation in the judicial system, introducing new requirements for the exercise of rights.

2.1 THE DIGITALIZATION OF THE JUDICIARY AND DIGITAL INCLUSION AS A LEGAL PROBLEM

The digitalization of the Judiciary is part of the logic of the network society, in which connectivity comes to condition the participation of subjects in different institutional spheres

(Castells, 1999). In this context, digital technology must be understood as a sociotechnical system, since it articulates infrastructure, devices and social practices, producing access filters related to connection, the mastery of digital interfaces and the availability of equipment (Lemos, 2013). In the justice system, this means that technology does not act as a neutral instrument, but as mediation that can broaden or restrict the effective exercise of the right of access to justice.

In Brazil, this process is institutionally driven by normative frameworks aimed at the modernization of justice and the overcoming of procedural slowness. Lei nº 11.419/2006 institutes the electronic judicial process, profoundly altering the dynamics of procedural processing (Brasil, 2006). This movement is intensified by CNJ policies, such as the Programa Justiça 4.0, articulated with Resolução nº 345/2020, which combines digitalization, automation and the broadening of remote access to judicial services (Conselho Nacional de Justiça, 2020).

These initiatives are part of an administrative rationality guided by the principle of efficiency, incorporated into the constitutional text by Emenda nº 19/1998. According to Di Pietro (2017), efficiency implies the optimization of resources and the improvement of the provision of public services. In the Judiciary, this logic materializes in the reduction of operational costs, the acceleration of processes and the broadening of remote service. However, this rationality tends to prioritize institutional performance without necessarily considering the social conditions of access of the population.

The intensification of digitalization during the Covid-19 pandemic makes this movement evident. The virtualization of hearings, remote service and digital processing came to constitute the dominant standard of functioning of the Judiciary. According to Saldanha and Medeiros (2018), the consolidation of an electronic process model exposes the dependence on material conditions of access, especially with regard to the exclusion of subjects who do not have the technological conditions necessary to participate in this model. The same authors demonstrate that access to justice depends on concrete material conditions, which, in the digital environment, include connectivity, equipment and specific competences, so that the absence of these conditions transforms technology into an obstacle, rather than a means of access.

This condition is particularly relevant in a country marked by structural inequalities in access to technology. Data from the TIC Domicílios 2024 survey indicate that the internet is present in all households of class A, but in about two-thirds of the homes of classes D and E, and that approximately 29 million people still do not use the internet in the country, of whom the majority have schooling up to primary education and a significant portion declare

themselves to be Black or Brown (Núcleo de Informação e Coordenação do Ponto BR, 2024). Peripheral regions, rural areas and populations in situations of vulnerability present significantly lower levels of access and connection quality, which limits their insertion into the digital justice system.

The literature on access to justice allows this displacement of barriers to be understood. Cappelletti and Garth (1988) identify that access involves overcoming economic and social obstacles; in the contemporary context, these obstacles also assume a technological dimension. Digital exclusion comes to operate as a specific form of legal exclusion, insofar as it impedes the effective exercise of formally guaranteed rights. In this sense, as Sadek (2010) observes, the justice system must be evaluated not only by the quantitative broadening of demands, but by the effective quality of access, which, in the digital field, implies recognizing that jurisdiction depends on the insertion of subjects into technological environments.

The digitalization of the Judiciary, therefore, cannot be analyzed merely as technological advancement, but as a process that reconfigures power relations in access to justice. According to Santos (2007), the justice system constitutes a space of dispute, in which different forms of exclusion are manifested. In the digital context, these exclusions are reorganized on the basis of the unequal distribution of access to technology, making it evident that institutional modernization can coexist with the reproduction of inequalities. The absence of structured policies of digital inclusion tends to deepen this scenario, insofar as digitalization advances without the corresponding guarantee of material conditions of access.

2.2 THE DIGITAL INCLUSION POINTS AS A PUBLIC POLICY

It is in this context that the Digital Inclusion Points are configured as a public policy institutionalized within the scope of the Judiciary. Resolução nº 508/2023 of the CNJ provides that it is incumbent upon the courts to install such spaces, to the extent of their availability and through joint actions between the branches of Justice, recognizing that digitalization requires compensatory mechanisms capable of guaranteeing access for populations in situations of digital vulnerability (Conselho Nacional de Justiça, 2023). The Digital Inclusion Points do not emerge as an isolated initiative, but as an improvement of Recomendação nº 130/2022 (Conselho Nacional de Justiça, 2022) and as a normative response to a structural contradiction between technological modernization and social inequality.

The Digital Inclusion Points constitute physical spaces equipped with technological infrastructure, in which the State provides equipment, internet connection and technical support to enable access to judicial services. These spaces may be installed in courthouses,

administrative units, municipalities, universities or in partnerships with public and private institutions, which broadens their territorial reach, with priority for municipalities that are not the seat of a judicial district or of a physical unit of the Judiciary. The policy is organized, therefore, on the basis of a logic of operational decentralization and institutional cooperation.

The function of the Digital Inclusion Points is not restricted to the provision of infrastructure. They operate as devices of sociotechnical mediation, in which the citizen is assisted in the use of digital judicial platforms. This mediation involves guidance for filing petitions, procedural consultation, participation in virtual hearings and service through the virtual counter. In this sense, they act in the translation between the digital system and the user, reducing the distance between institutional logic and the concrete conditions of the population. This is a policy guided by criteria of material inequality, which recognizes that formal access to justice does not, in itself, guarantee its effectiveness.

The operationalization of the Digital Inclusion Points involves articulation between different institutional actors. The Courts of Justice assume the coordination of the policy, while implementation may occur through partnerships with municipal entities, universities, public defenders' offices and other institutions. With regard to financing, the Digital Inclusion Points do not, as a rule, constitute a programme with a specific centralized budget, but are implemented from the courts' own resources, institutional agreements and the use of existing structures. This configuration reveals that the digital inclusion policy in the Judiciary is part of a complex federative arrangement, in which effectiveness depends on cooperation between different levels of government. The systematization of the policy is presented in Table 1.

Table 1

Systematization of the Digital Inclusion Points in the Brazilian Judiciary

Dimension	Characterization
Nature	Institutional public policy of the Judiciary
Normative basis	Resolução CNJ nº 508/2023 (improves Recomendação CNJ nº 130/2022)
Objective	Reduce inequalities in access to digital justice
Target audience	Populations in situations of digital vulnerability
Structure	Physical spaces with computers, internet and technical support
Operation	Mediation for access to digital judicial services and virtual counter
Implementation	Courts of Justice, with institutional partnerships
Financing	Own resources, agreements and existing structures
Organizational model	Variable according to the court
Scope	National, with unequal distribution

3 METHODOLOGY

The present study adopts a qualitative, descriptive-analytical approach, with a documentary analysis procedure. The choice of documentary research is justified by the institutional nature of the object investigated, which materializes in normative acts, administrative records and official data produced by the very bodies of the Judiciary. The research corpus is composed of normative acts, ordinances, resolutions, institutional programmes and data made available by the Courts of Justice and by the Conselho Nacional de Justiça.

The survey was carried out across the 26 state Courts of Justice and the Tribunal de Justiça do Distrito Federal e dos Territórios. The information was extracted from the institutional portals of the Courts of Justice, including transparency sections, normative acts, institutional news and administrative reports, as well as official documents related to the implementation of the Digital Inclusion Points. The analysis assumes a descriptive-analytical character, allowing the implementation of the policy to be mapped and its results to be interpreted in the light of the literature on access to justice and public policies (Souza, 2017; Arretche, 2012).

As an analytical procedure, the courts were classified into three categories, according to the degree of institutionalization identified: courts with effective implementation, evidenced by records of installed units and territorial reach; courts in the implementation phase, with a normative basis or institutional agreements, but without consolidated evidence of network functioning; and courts without identified formal institutionalization. It is recognized, as a limitation of the study, the dependence on the information made publicly available by the courts, which may underestimate ongoing initiatives not yet disclosed on their portals.

4 RESULTS AND DISCUSSION

The implementation of the Digital Inclusion Points within the scope of the Brazilian Courts of Justice reveals a scenario marked by institutional and territorial asymmetries, in which the public policy is not distributed homogeneously across the national territory. Although Resolução nº 508/2023 of the CNJ establishes the duty to create these spaces, their concrete materialization depends on the structural conditions of each court, which results in different levels of advancement in implementation. This pattern confirms what Souza (2017) identifies as a characteristic of public policies in federative contexts, in which decentralization tends to produce inequalities in execution.

In the group of courts with effectively implemented Digital Inclusion Points, consistent documentary evidence of functioning is identified, with records of installed units, territorial reach and, in some cases, quantitative data on expansion. Among these courts, the Tribunal de Justiça do Maranhão (TJMA) stands out, with 121 installed units; the Tribunal de Justiça de Mato Grosso (TJMT), with 60 units in operation; and the Tribunal de Justiça de Goiás (TJGO), with 47 implemented units. These data indicate an advanced level of institutionalization of the policy, associated with administrative capacity and the institutional prioritization of digital inclusion.

Still in this group, it is observed that the Tribunal de Justiça do Pará (TJPA) presents at least 62 publicly monitored units, while the Tribunal de Justiça da Paraíba (TJPB) records units in operation in 99 distinct municipalities, evidencing high territorial reach. The Tribunal de Justiça de Santa Catarina (TJSC), in turn, presents significant expansion, with 132 points identified in institutional records, which places it among the cases of greatest scope in the country. These data indicate that the policy, when articulated with territorial strategies, can reach expressive levels of coverage.

Other courts also present consolidated implementation, although with less quantitative detail, such as the Tribunais de Justiça da Bahia (TJBA), do Ceará (TJCE) and do Distrito Federal e dos Territórios (TJDFT), the latter with records of service in equipped courthouses. The Tribunal de Justiça de Pernambuco (TJPE) is part of the group with effective implementation, with a public list of classified units, while the Tribunal de Justiça do Piauí (TJPI) presents records of service provision on institutional panels. The Tribunal de Justiça do Rio Grande do Norte (TJRN) and the Tribunal de Justiça de Roraima (TJRR) likewise present evidence of functioning, although with specific institutional models.

On the other hand, a significant set of courts is in an intermediate stage, characterized by the existence of a normative basis or institutional agreements, but without consolidated evidence of network functioning. In this situation are the Tribunais de Justiça de Alagoas (TJAL), Amazonas (TJAM), Espírito Santo (TJES), Mato Grosso do Sul (TJMS), Paraná (TJPR), Rio de Janeiro (TJRJ), Rondônia (TJRO), São Paulo (TJSP) and Tocantins (TJTO). In these cases, the formal creation of the policy is observed, through ordinances, resolutions or cooperation agreements, but without public data that would allow the existence of Digital Inclusion Points in systematic functioning to be affirmed, which makes evident the difference between normative institutionalization and material execution of the policy.

The Tribunal de Justiça de São Paulo (TJSP), despite its institutional capacity, is in this category, with technical cooperation agreements signed, but without public consolidation of data on the functioning of the Digital Inclusion Points. This datum is particularly relevant,

as it indicates that administrative capacity does not automatically translate into effective implementation, reinforcing Arretche's (2012) argument on the complexity of implementing public policies in federative contexts. There are also situations of absence of identified formal institutionalization, as in the Tribunal de Justiça do Rio Grande do Sul (TJRS), in which no specific normative acts or documentary evidence of implementation were located in the period analyzed. The overview is synthesized in Table 2.

Table 2

National overview of the implementation of the Digital Inclusion Points

Category	Courts of Justice	Relevant data
Implemented (with evidence of functioning)	TJBA, TJCE, TJDF, TJGO, TJMA, TJMT, TJPA, TJPB, TJPE, TJPI, TJRN, TJRR, TJSC	Highlight: TJSC (132 DIPs), TJMA (121), TJPA (greater than or equal to 62), TJMT (60), TJGO (47), TJPB (99 municipalities)
Under implementation	TJAL, TJAM, TJES, TJMS, TJPR, TJRJ, TJRO, TJSP, TJTO	Existing normative basis or agreements, without consolidated network
Without identified institutionalization	TJRS	Absence of normative acts and of evidence of DIPs

Source: prepared by the author (2026).

The joint reading of these data makes evident that the digital inclusion policy in the Brazilian Judiciary cannot be explained only by differences in economic or structural capacity between the states. On the contrary, it is observed that courts inserted in distinct socioeconomic contexts present similar performances, while courts with high institutional capacity do not always present advanced levels of implementation. Courts located in states with lower economic capacity, such as Maranhão and Pará, present high levels of implementation and territorial reach, while courts situated in more structured contexts, such as São Paulo and Rio de Janeiro, are still in the initial stages of institutionalization of the policy.

This pattern indicates that the effectiveness of the policy is directly related to internal institutional factors, such as organizational strategies, administrative decisions and the degree of prioritization of the digital inclusion agenda within each court. The variation does not stem only from federative decentralization, but also from the way in which each court internalizes and operationalizes the policy. Moreover, the presence of more robust quantitative data is concentrated in the courts that developed mechanisms of monitoring and transparency, such as the monitoring panels adopted in Pará or the institutional programmes structured in Maranhão, which indicates that the production of data is also a central element for the consolidation of the policy.

From a theoretical point of view, this scenario confirms the analysis of Santos (2007), according to which universal public policies tend to produce unequal results when implemented in contexts marked by structural asymmetries. The digitalization of the Judiciary, by depending on technological infrastructure and institutional capacity, reproduces regional and institutional inequalities, even when guided by national norms. Thus, the national overview reveals not only the current stage of the policy, but also the structural limits that condition its effectiveness: the existence of courts with high territorial reach and others

without implementation makes evident that access to digital justice, in Brazil, remains pervaded by inequalities that require more robust policies of coordination and financing.

5 CONCLUSION

The analysis developed has made it possible to understand that the digitalization of the Brazilian Judiciary constitutes a structural process of reorganization of the forms of access to justice, in which technology comes to act as central mediation between the citizen and the legal system. This movement, driven by institutional policies aimed at efficiency and modernization, redefines the materiality of the exercise of rights, by shifting in-person practices into digital environments. However, this transformation does not take place in a neutral manner, since the incorporation of digital technologies occurs in a social context marked by profound inequalities in access to technological infrastructure.

Digital inclusion thus emerges as a constitutive dimension of the right of access to justice, insofar as it conditions the effective exercise of fundamental rights. Digital exclusion does not configure itself as a problem external to the legal system, but as an internal element of its operationalization. In this context, the Digital Inclusion Points configure themselves as an institutional response to the tension between technological modernization and social inequality, by providing infrastructure and technical support that reduce the barriers imposed by digitalization.

The empirical data demonstrate that the variation observed between the courts is not explained in a linear manner by economic or structural factors. Courts such as TJSC, TJMA, TJPA, TJMT and TJGO present more advanced levels of implementation, with an expressive quantity of Digital Inclusion Points and greater institutional integration, while courts such as TJSP, TJRJ, TJAM and TJPR are in an intermediate phase and the TJRS presents an absence of formal institutionalization. This scenario makes evident that the normative provision does not guarantee uniformity in the execution of the policy, whose effectiveness is directly related to institutional factors, such as the prioritization of the agenda, the capacity for inter-institutional articulation and the organizational models adopted.

In this way, the Digital Inclusion Points represent a relevant advance in the recognition of digital inclusion as a condition of access to justice, but their effectiveness depends on overcoming institutional asymmetries that pervade the Brazilian judicial system. The consolidation of the policy requires not only its normative provision, but the articulation between organizational strategies, institutional investment and adaptation to territorial specificities. It is concluded that the digitalization of the Judiciary will only configure itself as an instrument of democratization of access to justice when it is accompanied by policies

capable of confronting, in a concrete manner, the inequalities that condition the exercise of rights in the digital environment, which is why digital inclusion must be understood as a central dimension of contemporary judicial policy.

ABSTRACT

The literature on trade opening and economic and productivity growth is vast and has generally encountered mixed results. Several criticisms have been made of the traditional methods of investigation applied to this research agenda. Both traditional econometrics and case study approaches suffer from their own shortcomings. We employ the Synthetic Control Method in the study of sectoral labour productivity growth for two cases of opening to international markets: South Korea (1968) and Botswana (1979). We find that industrial sector labour productivity is quite responsive after the trade opening, with at least 4 years of much faster growth than the synthetic control for both South Korea and Botswana. A more modest rise occurs in the services sector. The agricultural sector did not appear to be affected by such an event. We therefore support previous research that found the industrial sector to be highly affected by trade opening.

Keywords: Trade Opening. Labour Productivity Growth. Synthetic Control Method.

RESUMO

A literatura sobre abertura comercial e crescimento econômico e da produtividade é vasta e tem geralmente encontrado resultados mistos. Várias críticas foram feitas acerca dos métodos tradicionais de investigação aplicados nessa agenda de pesquisa. Ambos a econometria tradicional e os estudos de caso sofrem com defeitos próprios. Nós empregamos o Método do Controle Sintético no estudo do crescimento da produtividade do trabalho setorial para dois casos de abertura ao comércio internacional: Coreia do Sul (1968) e Botsuana (1979). Nós encontramos que a produtividade do trabalho na indústria responde significativamente após a abertura comercial, com ao menos 4 anos de crescimento da produtividade mais veloz que a do controle sintético para ambos, Coreia do Sul e Botsuana. Um crescimento mais modesto ocorre no setor de serviços. O setor agrícola não aparenta ser afetado em tal evento. Nós, portanto, fornecemos suporte às pesquisas anteriores que encontraram um setor industrial fortemente afetado pela abertura comercial.

Palavras-chave: Abertura Comercial. Crescimento da Produtividade do Trabalho. Método do Controle Sintético.

RESUMEN

La literatura sobre liberalización comercial y crecimiento económico y de productividad es extensa y, en general, ha arrojado resultados mixtos. Se han formulado diversas críticas respecto a los métodos de investigación tradicionales aplicados a este tema. Tanto la econometría tradicional como los estudios de caso presentan limitaciones. Empleamos el Método de Control Sintético para estudiar el crecimiento de la productividad laboral sectorial en dos casos de liberalización del comercio internacional: Corea del Sur (1968) y Botsuana (1979). Observamos que la productividad laboral en la industria responde significativamente tras la liberalización comercial, con un crecimiento de la productividad al menos cuatro años superior al del control sintético tanto para Corea del Sur como para Botsuana. El crecimiento en el sector servicios es más moderado. El sector agrícola no parece verse afectado por este fenómeno. Por lo tanto, respaldamos investigaciones previas que encontraron un sector industrial fuertemente afectado por la liberalización comercial.

Palabras clave: Liberalización Comercial. Crecimiento de la Productividad Laboral. Método de Control Sintético.

1 INTRODUCTION

The literature on trade opening and economic growth is vast. Many articles have attempted to identify whether opening to international markets has any effect on economic growth. Although vast, the question of identifying the factors involved has received some attention in the literature. Rodriguez and Rodrik (2001) pointed out some caveats. The authors reviewed four influential articles on trade opening and economic growth in the 1990s and argued that, although the specialists were very willing to associate episodes of trade liberalisation with economic growth, their conclusions were not very robust. The fact that the literature has constantly altered the methods and the measures of trade opening suggests, for the authors, that, instead of strongly supporting the relationship, the literature seems to point to more doubts than certainties.

At that time, there were two ways of investigating the subject. Either the studies concentrated on analyses of large data panels, or they focused more on case studies, as suggested by Bhagwati and Srinivasan (2001). The two approaches presented their own limitations, the first presenting endogeneity problems (Rodriguez; Rodrik, 2001), while the second was subject to a lack of statistical rigour.

The Synthetic Control Approach is seen as a third path between panel data and case studies, combining both methods to generate a better assessment of the topic. The emergence of this particular method began with Abadie and Gardeazabal (2003) and Abadie, Diamond and Hainmuller (2010). Many studies have come to use this type of analysis since the development of the method. The literature on macroeconomics, in particular, has benefited greatly from this method, since it has made possible a test similar to an experiment in a context where the need for a larger database is more limited. The approach, in essence, addresses the questions raised by Srinivasan and Bhagwati (2001), but without the shortcomings from a statistical point of view.

Let us take as an example Billmeier and Nanicinni (2013), who used a synthetic control approach to explore the opening to international markets and the growth of GDP per capita. They selected 30 cases in which they could explore the treated countries that had undergone trade opening in comparison with a counterfactual synthetic control that did not open. They used the Sachs-Warner indicator of trade opening to account for the opening episodes and carried out two different estimations. One in which the control group was composed of all possible countries and another in which the estimation was made within the region of the treated country, to better control for the geographical and historical characteristics. The authors found that the opening was effective in increasing per capita income. It was more

effective in the decades of the 1960s, 70s and 80s, but not in the 1990s, when most of the opening cases occurred in Africa.

Similar to Billmeier and Nanicinni (2013), a small but growing literature using the synthetic control approach is emerging to better assess the results of political and non-political shocks. The original articles of Abadie and Gardeazabal (2003) and Abadie, Diamond and Hainmuller (2010) addressed the economic costs of terrorism in the Basque Country and of an anti-tobacco law in California. Adhikari et al. (2016) assessed labour market reforms in Europe during the 1990s. Abadie et al. (2014) assessed the economic impact of German reunification. Cavallo et al. (2013) explored supply shocks generated by natural disasters, which is also the focus of Barone and Mocetti (2014), who studied institutions and growth after a supply shock generated by two earthquakes. Nannicini and Riciutti (2010) applied the method to study the impact of autocratic transitions on real GDP per capita. Campos, Coriceli and Moretti (2014) studied the impact of the formation of the European Union on the GDP per capita of the member countries.

In this article, we propose to take advantage of the synthetic control method to extend the study of Billmeier and Nanicinni (2013). We use the trade opening classification of Wacziarg and Welsh (2008) to redo the analysis of Billmeier and Nanicinni (2013) in a more disaggregated manner. This means that we are more interested in the sectoral evolution of labour productivity growth. There are three channels through which productivity may increase, based on Muendler (2002). It may be that: (i) better imported machinery is now available; (ii) a competitive pressure effect forces firms to become more productive in order to survive; (iii) there is a change in firm-level employment, as inefficient firms are pushed out of the market by foreign competition and efficient ones absorb more labour as a consequence. Effects (ii) and (iii) are expected only in the tradable sectors of agriculture and industry. Services are subject only to effect (i).

The analysis cannot be extended to many case studies, as in Billmeier and Nanicinni (2013), due to data limitations. It is necessary to have a specific country subject to an episode of trade opening and a set of comparison countries to construct the synthetic control. Our sectoral data do not cover such a large sample, but they offer the opportunity to study two major successful episodes of trade opening, according to Billmeier and Nanicinni (2013), in two different regions of the globe: South Korea and Botswana. These two cases may provide information about the importance of labour productivity growth in each sector after an episode of trade opening, as well as about which channels may be in action, by visualising which sectors responded more to the treatment.

Most studies on liberalisation and sectoral productivity growth point to the existence of a positive relationship, mainly for the industrial sector, due to greater access to data (Muendler, 2002; Pavcnik, 2002; Tybout; Westbrook, 1995; Levinsohn, 1993), but some others did not find such an effect (Pack, 1988; Tybout; De Melo; Corbo, 1991; Bernard; Jones, 1996). As already mentioned, in this controversy lie the criticisms of the methods used in the literature, made by Pritchett (2000), Bhagwati and Srinivasan (2001) and Rodriguez and Rodrik (2001). We therefore proposed to try to answer this question using a more recent approach.

We are not aware of any article that uses the synthetic control method to investigate trade opening based on sectoral data. Thus, we hope to shed light on the growth of sectoral labour productivity in the context of a method that is not subject to endogeneity problems and that is also more robust than case studies, which are more prone to biased data selection. In this way, we are addressing the same methodological questions that Billmeier and Naniccini (2013) dealt with in their article, as well as those raised by Rodriguez and Rodrik (2001) and Bhagwati and Srinivasan (2001).

The article is structured as follows: the next section briefly reviews the existing literature on trade opening and GDP growth and/or productivity growth. Both the older literature, subject to the criticisms of Rodriguez and Rodrik (2001), and the new literature that adopted the synthetic control approach. The methodology section explains the data and the synthetic control approach. The results present our estimates and the discussions. Then, the final considerations.

2 LITERATURE REVIEW

In this section, we analyse some articles on trade opening and growth, or trade opening and productivity growth. Most of the review will address older articles on the topic, generally using non-quasi-experimental techniques.

We have already discussed the work of Billmeier and Naniccini (2013) in the introduction. A quite similar article would be that of Campos, Coricelli and Moretti (2014), who investigated the access to the European Union market of 12 countries and their subsequent GDP per capita using the synthetic control method. The countries were classified into core and peripheral countries for analytical purposes. Entry into the common area is analogous to trade liberalisation, since one of the main characteristics of this integration is the reduction of tariffs. However, entry into the Eurozone also represents a broader reform, since not only the transit of goods is affected, but also financial flows and the integration of the labour market increase. Therefore, the article must be interpreted in a broader way. The results for the core

showed lower growth rates than for the periphery, although neither situation was statistically significant, which means that other peripheral nations that did not adopt the euro also presented a similar GDP per capita afterwards.

Ben David (1993) was interested in the relationship between trade opening and economic convergence. To study this, the author focused on the 6 original members of the European Economic Community (EEC). Both trade theories, through factor equalisation mechanisms, and neoclassical growth theories, through technology transfer, suggest that economic growth and convergence would be generated by trade opening. The author found that the convergence of low-income countries in the EEC is related to the timing of the opening. This is especially true for the countries that entered the community later but did not fully adhere to the trade agreements. Only after they began to integrate did their economies seem to converge to the level of the older and more advanced members. It is interesting to note that this article is related to that of Campos, Coricelli and Moretti (2014). They differ because Ben David (1993) is focused on the European Community, which foreshadowed the creation of the European Union. Different statistical techniques were applied and the results were opposite. In one article, we cannot attribute the convergence to the central levels of development to entry into the common markets, and in the other, this is the precise conclusion. It may be that the different circumstance was important, but also that the study of Ben David (1993) suffered from the methodological problems already mentioned.

As for the sectoral studies, most concentrate on the industrial sector, due to the availability of data on the manufacturing sector. The following articles studied the channels through which liberalisation may have an effect.

Levinsohn (1993) was one of the first to test what Muendler (2002) later called the competitive impulse. Levinsohn (1993) called this the imports-as-market-discipline hypothesis. It is the idea that firms may become more competitive if they are more exposed to competition. The author uses data from firms in the Turkish manufacturing sector to estimate an industrial organisation model especially suited to test the hypothesis, after Turkey opened its markets in 1984. The results were positive and there seems to be a competitive stimulus after the trade opening.

Tybout and Westbrook (1995) took advantage of the Mexican trade opening in 1986 to study the Mexican manufacturing industry by sector. The authors separated the effects into several possibilities: (i) the scale effect present in economies of scale; (ii) the share effects, or the reallocation of workers from low to high productivity; (iii) the residual effects: this term refers to the other possible effects, which are difficult to disentangle. Learning by doing, externalities, technological innovation, etc. Their findings pointed to a lesser importance of

economies of scale and to the greater relevance of residual effects, the use of foreign inputs and the share effect of the transfer of labour to more productive firms. The share effects were also highlighted by Pavcnik (2002), in his study on Chilean manufacturing firms after the trade liberalisation in the 1970s. It was found that this channel had notable importance for productivity growth.

These works pointed to the existence of productivity growth in the industrial sector through several sources. Thus, it would be expected that we would find a positive effect for the industrial sector of South Korea and Botswana, if they were well planned. In addition, we relate these articles to our findings in the conclusion.

3 METHODOLOGY

3.1 EMPIRICAL STRATEGY

We compare the patterns over time in labour productivity of countries exposed to trade opening with those of a control group of unaffected countries. To construct a reliable control group, we adopt the synthetic control method for comparative case studies (Abadie; Gardeazabal, 2003; Abadie et al., 2010). This is the most suitable method for understanding the effects of an exogenous change in policy that affects some countries while leaving others unaltered (control). The idea is to estimate the causal effect of a treatment as the difference between the outcome observed in the treated areas and that observed for a weighted average of the controls. The weights minimise a penalty function that depends on the pre-intervention pattern of the outcome variable and of several of its predictors.

The method, as described in Abadie *et al.* (2010), may be better formalised as follows: There are $J + 1$ regions and let the first be the one affected by the change in policy (trade opening). Now, y_{it}^1 let it be the labour productivity in country i ($i = 1, \dots, J+1$) at that moment t ($t = 1, \dots, T$) the country receives the change of policy, and y_{it}^0 if the country is not exposed to the change of policy. Let T_0 be the number of periods before the trade opening ($1 \leq T_0 \leq T$). We are then assuming that there is no way the opening to trade policy change can have an effect before the event occurs, so that $Y_{it}^0 = Y_{it}^1$ for any country and at any moment $t < T_0$. Let $\alpha_t = y_{it}^1 - y_{it}^0$ be the effect of the trade opening at moment $t > T_0$. Then, the labour productivity observed in the affected country may be written as: $y_{it}^1 = y_{it}^0 + \alpha_t D_t$. It follows, therefore, that for $t > T_0$, $\alpha_t = y_{it}^1 - y_{it}^0$, but y_{it}^0 is not observed and needs to be estimated. Abadie *et al.* (2010) suggest estimating α_t with $\alpha_t = y_{it} - \sum_{j=2}^J w_j y_{jt}$ for $t > T_0$, where the weights w_j are chosen to minimise a given penalty function (given by the Mean Squared Prediction Error - MSPE) that depends on the pattern of labour productivity before the opening and on the values of some predictors of labour productivity before the opening.

3.2 DATA

As already mentioned, we will study the effects of trade opening on the growth rates of labour productivity in two important cases: South Korea and Botswana. In order to be able to use the Synthetic Control method, we need to choose these countries as the ones that will receive the treatment, in order to construct the synthetic control adequately. Essentially, we need to introduce the treatment into a country and generate a set of countries unaffected by it. This requirement limits our possibilities of assessment, since, for many countries that experienced the opening to international markets, we could not find enough countries to generate a suitable control set.

We use the definition of open economy of Sachs and Warner (1995), extended by Wacziarg and Welch (2008), in line with Billmeier and Naniccini (2013). A country is defined as closed if: (i) the average tariffs exceed 40%; (ii) the non-tariff barriers cover more than 40% of its imports; (iii) it has a socialist economic system; (iv) the black market premium on exchange rates exceeds 20%; (v) a large part of its exports is controlled by a state monopoly.

Let us take South Korea as an example. It opened its markets in 1968, according to the definition above. We need to construct a synthetic control using other closed countries as potential controls, so that both are closed before 1968, and South Korea opens after that, while the others remain closed. This requirement is what limits the number of cases we can study, since we can only follow a sufficiently large set of controls for the experiences of South Korea and Botswana. The control set is constructed by organising categories of countries with some similarity. Asia, Latin America, North Africa and the Middle East were chosen to function as the control set for the South Korean experience. It is not advisable to include advanced OECD economies or poor Sub-Saharan African countries, because they are at different levels of development, and the proximity of the treated unit and the control set helps to further improve the pre-treatment suitability. As for Botswana, we chose Sub-Saharan Africa, Latin America, North Africa and the Middle East. We did this because Botswana is today one of the most advanced African economies and was already in a decade of high growth when it opened (World Bank data), in addition to already being a democracy, while most of Africa lived under dictatorships. Furthermore, adding more countries to the control group also contributes to the pre-treatment suitability.

For South Korea, which opened its borders in 1968, we considered the following countries and their respective opening dates as the control country set, using Wacziarg and Welch (2008) as the measure of opening: Argentina (1991), Brazil (1991), Chile (1976), Colombia (1986), Costa Rica (1986), Mexico (1986), Peru (1991), Venezuela (1989), India (always closed), Morocco (1984) and Egypt (1995).

For Botswana, which opened its borders in 1979, we considered the countries of Latin America, North Africa and the Middle East listed above, in addition to Ghana (1985), Kenya (1993), Malawi (always closed), South Africa (1991) and Senegal (always closed).

Our outcome is labour productivity by sector. We define labour productivity as value added per employed person. The data come from the sectoral database of the Groningen Growth and Development Center - GGDC. We define the agricultural sector as the agricultural sector of the GGDC. Industry is defined as (Mining + Manufacturing) in the GGDC. And services are defined as the sum of public services, construction, trade, transport, business services and personal services in the GGDC. We exclude government services from the metric because their productivity is more difficult to measure and may be biased.

Our set of predictor variables includes: Investment (Gross Fixed Capital Formation), World Development Indicators (World Bank), Population Growth (World Bank) and Inflation (GDP Deflator). Our measure of Human Capital is the share of the population with completed secondary education, called "Secondary Education", available in the Barro Lee Project (interpolated data). In addition, we also include a measure of democracy/institutional quality, called "Polity", available in the Polity IV database (Polity2). We also calculate the share of each sector, called "AgriShare", "IndShare" and "SerShare", also using the GGDC data and our classification of agriculture, industry and services.

We chose these predictors because they appear in most growth regressions and synthetic control method approaches for the predictors of output measures, and they are the ones with broad support in the literature (Barro, 1991, Billmeier; Naniccini, 2013), Abadie; Gardeazabal, 2003), Barone; Mocetti, 2014).

The logic behind the inclusion of these variables is as follows: the investment rate and population growth affect labour productivity through the capital stock available per worker, according to the Solow Model (1956). More capital means that workers can become more productive, since both factors of production are complementary. The capital stock per worker increases with a higher investment rate and decreases with greater population growth, since the entry of more workers into the market means a lower capital/labour ratio. The inflation rate and the measure of democracy control for the level of development and institutional quality. The level of schooling measures a qualified workforce, capable of being more productive. And the shares control for the structural transformations (Barro, 1991). As we do not have access to sectoral data on the predictors, we use the measures for the whole economy as a proxy. We argue that the sectoral data on the predictors probably follow closely the data for the whole economy. Furthermore, given that our control group is composed of countries with similar levels of development, they probably use predictors of similar quality

for each sector. For example, if Brazil allocates a larger share of its qualified workforce to the industrial sector, South Korea, which had a similar level of development, probably allocates a closer share.

We tried to fit the specification with all the predictors initially. When the Mean Squared Prediction Error is not satisfactory, then we tried to fit the specification with fewer predictors. This is especially true for the agricultural sector of South Korea. In addition, we also applied the Hodrick-Prescott filter on the labour productivity growth in the agricultural sector of South Korea, to avoid excessive fluctuations and a worse fit. The filter was applied using the smoothing factor θ of 6.25, which is the appropriate one for annual data. We tried to apply the filter also for Botswana, since the errors were larger than for South Korea, but smoothing the series did not help to fit a better synthetic control, so we chose to keep the original data, even if the fluctuations were large.

Many studies use all the pre-treatment values of the outcome variable as a predictor. We incorporate in our work the relatively recent criticism of this procedure. Ferman et al. (2016) carried out Monte Carlo simulations on several popular specifications for the synthetic control. They found that the inclusion of all the pre-treatment values of the outcome variable performed particularly poorly in the simulations. Along the same lines, Kaul et al. (2018) showed that the use of all pre-treatment values causes the optimisation procedure to reflect only the outcome, making the predictors irrelevant, which is not advisable if the objective is a realistic control. The work of Billmeier and Naniccini (2013) is criticised for its approach.

To deal with this issue, we use only up to 3 years of the pre-treatment outcome in our specification, leaving greater room for the predictors. The periods chosen for the analysis are 1964-1978 for South Korea and 1971-1989 for Botswana. We report a post-treatment effect of 10 years for both cases, but we concentrate more on the first 5 years, since it is more reasonable to identify such effects as related to the trade opening. The pre-treatment years are defined by the availability of data.

The graphs for the estimation of the synthetic control and the placebo are inserted directly into the text. It is worth noting that the balance of the predictors does not need to be entirely similar to the treated values. An attempt to fit one of the values will inevitably distort the others. What is important is to show a low Mean Squared Prediction Error for the pre-treatment years of the treated variable, as well as for the controls in the placebo experiments. The technique will always choose a combination that is more suitable than the weighted average of the values of all countries in the control set. Therefore, we do not report this characteristic.

4 RESULTS

In this section, we present the results. Firstly, we show the results for South Korea, broken down by sectors. The same occurs with Botswana. The tables with the unit weights and the balance of the predictors can be found in the appendix, as already mentioned. The graphs are presented in the text.

4.1 SOUTH KOREA

4.1.1 Agriculture

Firstly, we examine the results for the growth of labour productivity in the agricultural sector of South Korea. As already discussed, the synthetic control method uses a set of control countries to apply a minimisation algorithm and find the best pre-treatment fit of the real trajectory. We chose to select one of the intermediate years (1966), as it generated the best Mean Squared Error. In addition, we used the Hodrick-Prescott filter on the outcome variable to follow the trend and prevent the oscillation of the labour productivity growth rates from producing an inadequate fit. As mentioned in the data section, we use 6.25 as the smoothing factor, which is common in the literature for annual data.

We can observe the visual inspection presented in Figure 1(a). The fit does not seem very good for the first years, since the pattern of very high growth rates that fell rapidly is exclusive to the treated unit, but it follows a closer trend when near the treatment, in 1968. After the trade liberalisation, we could expect that the opening of the markets would produce an increase in the growth of labour productivity through the channels discussed. In fact, the trade opening does not seem to have affected the growth of labour productivity in the agricultural sector of South Korea in the post-treatment years, which is corroborated by the placebo estimates, whose results are presented in Figure 1(b) and show no signs of statistically significant effects.

Figure 1

Agriculture. (a) Synthetic control (b) Placebos

4.1.2 Industry

As for the industrial sector, we present the weighting units which show a combination of Brazil, India and Morocco as the one that best fits the data (Figure 2(a)). We can observe that the behaviour of the labour productivity growth in the synthetic industry of South Korea before the treatment follows closely that of real South Korea. However, after the opening of the market, the behaviour diverges during the period from 1969 to 1972. In these four years, the growth of labour productivity in the industrial sector of South Korea reached up to 15% in 1969 and 1970, approximately twice that observed in the synthetic control. This behaviour suggests that the industrial sector of South Korea, unlike the agricultural sector, indeed obtained a higher growth rate due to the trade opening of 1968.

Figure 2*Industry. (a) Synthetic control (b) Placebos*

Source: prepared by the authors based on the research data.

Observing Figure 2(b), it is clear that the results are significant at the level of 1/13, or 7.7% for the year 1966, which is below the highest significance level generally reported, of 10% for the period from 1969 to 1972. We note that the fits of the placebos are as good as those of the treated unit for most placebos. In eleven of them, the fits are sufficiently close to generate small gaps in the pre-treatment, which guarantees the quality of the significance test (Abadie et al., 2010).

4.1.3 Services

The growth of labour productivity in the services sector of South Korea also seems to react to the trade opening in 1968. We present the weighting units which show that Brazil only is the best control for South Korea.

Figure 3(a) allows the visual inspection. The pre-treatment is good, except for the year 1966. Similar to the industrial sector, the growth rates rise to the level of 10% in 1969 and, throughout the period from 1968 to 1971, the growth rates are higher than in the synthetic control. After this first rise and the return to normal rates in 1972, there is a sharp drop, followed by a sharp rise in the growth rates of labour productivity. We could not understand this pattern through the trade opening mechanisms, therefore, we chose to ignore the results after the 1970s, although in 1973 there is a peak in the labour productivity growth rate of almost 15%, which is significant if we observe Figure 3(b). This is probably due to other reforms implemented in South Korea during this period and may also reflect economic fluctuations.

Figure 3

Services. (a) Synthetic control (b) Placebos

Source: prepared by the authors based on the research data.

Observing Figure 3(b) again, we can see that the results are significant at 1/13, or 7.7% (and also at 10%) for the initial years from 1968 to 1970, although the growth rates are more modest than in the industrial sector.

4.2 BOTSWANA

4.2.1 Agriculture

The estimates for the unit weights and the balance of the predictors for the growth of agricultural labour productivity in Botswana are presented. The best fit is a combination of Argentina, Kenya, South Africa and Venezuela. All the predictors are included, together with the 3 intermediate years of the pre-treatment of the outcome variable.

Figure 4(a) presents the visual fit. It can be observed that the first half of the pre-treatment is responsible for the relatively high Mean Squared Error. However, near the treatment, the synthetic series behaves much more closely to the reality of Botswana. The post-treatment is similar to the case of South Korea, where there is no peak in the rate of growth of the treated agricultural labour productivity. The placebos are presented in Figure 4(b), where the result does not seem statistically significant if all the placebos are kept or if those with the worst fit in the pre-treatment are removed. The trade opening does not seem to affect the treated outcome.

Figure 4

Agriculture. (a) Synthetic control (b) Placebos

Source: prepared by the authors based on the research data.

4.2.2 Industry

The best fit uses Kenya as control. All the predictors are included in the last 3 years prior to the treatment. These years aim to control the extreme peak in the growth rates of industrial labour productivity in the last years prior to the treatment, especially in 1978. Unfortunately, it is not possible to capture this peak in the control, which ends up producing a poor fit. One way to theorise about this peak is to assume that the trade opening should be accounted for in the year 1978, instead of the year suggested by the methodology of Wacziarg and Welch (2008), which is 1979. It may be that Botswana was already in the process of rapid trade opening in 1978, but had not yet surpassed the limits defined by the authors. The problem with this logic would be that the result of 1979, a sharp drop in the growth rate, is difficult to explain.

The year 1979 was marked by a global oil shock, but the drop seems sharper in the Botswana data, which rules out the effect of a global recession. An internal recession in 1979 could explain the pattern, but according to the World Bank data, the growth rates were still positive in that year. The best explanation may come from Acemoglu et al. (2003). The authors explained that Botswana discovered many deposits of copper, nickel, coal and, mainly, diamonds. These mines attracted workers during the 1970s and proved to be highly productive. Apparently, 1979 marked the end of the structural transformation.

Figure 5*Industry. (a) Synthetic control (b) Placebos*

Source: prepared by the authors based on the research data.

Given that the growth of industrial labour productivity generated by a structural transformation in the mining sector would be difficult to control, it is understandable that the behaviour of the pre-treatment trajectory of Botswana is singular. Even so, we capture many years well, and the synthetic control seems to be, in a way, at the average of real Botswana. The post-opening growth is captured in the years from 1980 to 1985, where the growth rate of industrial labour productivity is above the control. Figure 5(b) presents the placebos. We can attest to the existence of a statistically significant growth rate for the years from 1981 to 1984, of 1/16, or 6.25% (below 10%). As we could observe in the agricultural sector, the pattern also fitted the trajectory of the South Korean industry.

4.2.3 Services

Finally, the growth of labour productivity in the services sector is the one that best fits Botswana, with a Mean Squared Error of 6.72, balancing of the predictors. Similar to the industrial sector, we chose to use the values of the last three years of the outcome as a predictor. In addition, we also used all the main predictors. The synthetic control was constructed by the combination of Colombia, Kenya and Venezuela.

The pre-treatment trajectory fits the services sector better than the agricultural and industrial sectors, as shown in Figure 6(a). The placebos are also better represented by the specification of the services sector, as can be observed in Figure 6(b). The opening seems to positively affect the growth of labour productivity in the services sector in the first two years after its implementation, 1979 and 1980, but the effect disappears afterwards, giving way to a large drop in 1981, followed by a recovery. The pattern is quite similar to that observed in

the services sector of South Korea. We chose to ignore the subsequent oscillations after 1981, since it is difficult to explain them using the mechanisms described in the introduction. The placebos are also significant at a level of 1/16, or 6.25% confidence (lower than 10%), for 1979 and 1980. The effect is not sufficiently large or persistent as in the industrial sector, just as it also happens in South Korea.

Figure 6

Services. (a) Synthetic control (b) Placebos

4.3 DISCUSSION OF THE RESULTS

The similarity of the results for South Korea and Botswana after the trade opening is striking. Both presented an agricultural sector that did not have notable gains in the post-intervention period. The pattern of the industrial sector is also similar, with effects that last around 4 or 5 years in both countries after the opening, showing a sustained peak of growth of 10% for South Korea and a peak close to 40% for Botswana in 1982, with 20% afterwards. Finally, the services sector also performed quite similarly, with a shorter reaction period, of 2 or 3 years, with a much lower growth rate for Botswana and a peak of around 10% for South Korea and 20% for Botswana. In addition, both present the same peculiar pattern afterwards, with oscillating labour productivity growth rates.

We must bear in mind that not all the results are of the best quality. The results for the agriculture of South Korea and for the agriculture and industry of Botswana must be interpreted with caution, since they do not present a good correspondence with the pre-treatment. The other three results, industry and services of South Korea and services of Botswana, seem better and more reliable. Even so, the similar pattern in both cases reinforces the hypothesis of the effects, even in cases where the correspondence is

particularly poor, as in the industrial sector of Botswana. If we accept the existence of a previous structural transformation in the mining sector, as in Acemoglu et al. (2003), we can better understand the erratic pattern of this case. In addition, if the structural transformation continues to occur after the trade opening, the very high results found for Botswana may be the combination of the structural transformation in the mining sector with a greater efficiency arising from the trade opening.

This last concern, highlighted in this last paragraph, is also present in Billmeier and Naniccini (2013), where the results must be interpreted with caution, since the trade opening is usually accompanied by other reforms that may also increase productivity. Restricting the analysis to the years closest to the opening should be more reliable than the results after 5 years.

The possible interpretation for the positive results in the industrial and services sectors is related to the mechanisms presented in the introduction. We expected the tradable goods to react more strongly to the opening, since they are subject to the three channels discussed: the new inputs channel; the competitive impulse channel; and the selection effects, while the services sector is subject only to the new inputs channel, since it is protected from foreign competition by the high transport costs. The growth of industrial labour productivity reacted more strongly than that of the services sector, but the agricultural sector did not react. We do not have a convincing explanation for this, but we speculate that the agricultural sector in such poor economies (South Korea was a lower-middle-income country in 1968) is mainly subsistence agriculture, with low levels of human capital and, therefore, lower capacity to incorporate technology into its products.

5 FINAL CONSIDERATIONS

We studied the growth rates of sectoral labour productivity in two countries that opened to international markets, South Korea (1968) and Botswana (1979), using the synthetic control method of comparative case studies developed by Abadie and Gardeazabal (2003) and Abadie et al. (2010).

We found that the industrial sector seems to be the one that presents the greatest benefits of the trade opening, followed by the services sector. In the agricultural sector, the growth rate of labour productivity does not respond to the trade opening. The results are in agreement with the part of the literature that finds large effects for the industrial sector, as highlighted in the Literature Review section, but they fill the gap through the use of a quasi-experimental design, addressing the endogeneity criticism on the part of the panel data and

the lack of statistical rigour on the part of the informal case studies. As far as we know, this is the first study to corroborate these results with such a design.

The merits of this study are clear, but future studies could try to address some issues. Firstly, we used substitute variables for the predictors, since we could not find sectoral data. If the sectoral data were available, the fit could be much better. Secondly, the data on sectoral labour productivity were available only for some countries. If it were possible to access data from more countries, more comparisons could be made, as in the aggregate analysis of Billmeier and Naniccini (2013). Furthermore, our control base was the best we could obtain with the little data available. The inclusion of more countries could also contribute to the creation of a control base through regional aggregation, which would probably increase the pre-treatment fit, since this base would be more likely to include similar countries.

ABSTRACT

This study analysed the epistemology of academic agroecology starting from the hypothesis that the field, although it claims to be critical of the productivist paradigm and open to the dialogue of knowledges, frequently recomposes modern regimes of scientific validation under new terminology. The aim was to understand whether the presence of Indigenous, traditional and territorial knowledges structurally alters the criteria of legitimacy of knowledge or whether it remains subordinated to academic mediation. A qualitative, analytical-comparative and interdisciplinary approach was used, applying the Epistemic Capture Matrix and the Epistemic Capture Index to a corpus of thirty academic studies selected from three information systems: Cadernos de Agroecologia, Scopus and Google Scholar. The dimensions analysed were Validation Regime, Indigenous or Traditional Presence, Predominant Epistemology, Epistemic Authority, Relationship with the Territory, Epistemic Capture and Micro-recognition, termed subemotépübi. The results indicated a global incidence of epistemic capture of 0.73, with the highest occurrence in Google Scholar, followed by Cadernos de Agroecologia and Scopus. The analysis demonstrated that academic agroecology does not constitute a homogeneous field of capture, but neither does it fully break with the structural coloniality of validation criteria. Throughout much of the corpus, Indigenous and territorial knowledges appear as a reference or critical repertoire, without effectively reorganising the centres of epistemological authority. It is concluded that the concept-method Etnoagroecologizar, grounded in the Território-Ente arising from the experience with the Karão Jaguaribaras, offers a path of epistemological reorganisation in the face of the latifundium of knowledge in academic agroecology.

Keywords: Academic Agroecology. Epistemic Capture. Indigenous Epistemology. Território-Ente. Etnoagroecologizar.

RESUMO

Este estudo analisou a epistemologia da agroecologia acadêmica a partir da hipótese de que o campo, embora se afirme crítico ao paradigma produtivista e aberto ao diálogo de saberes, frequentemente, recompõe regimes modernos de validação científica sob nova terminologia. O objetivo foi compreender se a presença de saberes indígenas, tradicionais e territoriais

altera estruturalmente os critérios de legitimidade do conhecimento ou se permanece submetida à mediação acadêmica. Foi utilizada a abordagem qualitativa, analítico-comparativa e interdisciplinar, com aplicação da Matriz de Captura Epistêmica e do Índice de Captura Epistêmica a um corpus de trinta estudos acadêmicos selecionados em três sistemas de informação: Cadernos de Agroecologia, Scopus e Google Acadêmico. As dimensões analisadas foram Regime de Validação, Presença Indígena ou Tradicional, Epistemologia Predominante, Autoridade Epistêmica, Relação com o Território, Captura Epistêmica e Microreconhecimento, denominado subemotépübi. Os resultados indicaram incidência global de captura epistêmica de 0,73, com maior ocorrência no Google Acadêmico, seguido dos Cadernos de Agroecologia e da Scopus. A análise demonstrou que a agroecologia acadêmica não constitui campo homogêneo de captura, mas tampouco rompe integralmente com a colonialidade estrutural dos critérios de validação. Em grande parte do corpus, saberes indígenas e territoriais comparecem como referência ou repertório crítico, sem reorganizar efetivamente os centros de autoridade epistemológica. Conclui-se que o conceito-método Etnoagroecologizar, fundamentado no Território-Ente advindo da experiência com os Karão Jaguaribaras, oferece uma vereda de reorganização epistemológica diante do latifúndio do saber na agroecologia acadêmica.

RESUMEN

Este estudio analizó la epistemología de la agroecología académica a partir de la hipótesis de que el campo, aunque se afirma crítico del paradigma productivista y abierto al diálogo de saberes, frecuentemente recompone regímenes modernos de validación científica bajo una nueva terminología. El objetivo fue comprender si la presencia de saberes indígenas, tradicionales y territoriales altera estructuralmente los criterios de legitimidad del conocimiento o si permanece sometida a la mediación académica. Se utilizó el enfoque cualitativo, analítico-comparativo e interdisciplinario, con la aplicación de la Matriz de Captura Epistémica y del Índice de Captura Epistémica a un corpus de treinta estudios académicos seleccionados en tres sistemas de información: Cadernos de Agroecología, Scopus y Google Académico. Las dimensiones analizadas fueron Régimen de Validación, Presencia Indígena o Tradicional, Epistemología Predominante, Autoridad Epistémica, Relación con el Territorio, Captura Epistémica y Microreconocimiento, denominado subemotépübi. Los resultados indicaron una incidencia global de captura epistémica de 0,73, con mayor ocurrencia en Google Académico, seguido de los Cadernos de Agroecología y de Scopus. El análisis demostró que la agroecología académica no constituye un campo homogéneo de captura, pero tampoco rompe íntegramente con la colonialidad estructural de los criterios de validación. En gran parte del corpus, los saberes indígenas y territoriales comparecen como referencia o repertorio crítico, sin reorganizar efectivamente los centros de autoridad epistemológica. Se concluye que el concepto-método Etnoagroecologizar, fundamentado en el Território-Ente proveniente de la experiencia con los Karão Jaguaribaras, ofrece una vereda de reorganización epistemológica frente al latifundio del saber en la agroecología académica.

[...] neither agricultural scientists nor agroecologists are aware of the subordination of their research [...] many conduct research following the dominant method. (Norgaard; Sikor, 2002).

1 INTRODUCTION

Academic agroecology occupies an ambiguous place within contemporary disputes over knowledge, territory and the production of life. On the one hand, it presents itself as a critique of the productivist paradigm, the Green Revolution, technical diffusionism and disciplinary fragmentation. On the other, it often remains inscribed within the same validation protocols it claims to challenge. This tension is not peripheral; it constituted the very problem of this study.

The central question does not consist in denying the importance of agroecology as a scientific, political and territorial field. It consists in examining whether, within its academic production, there is a structural displacement of modern validation regimes or merely a recomposition of their grammar under critical vocabulary. The decisive question is less what the texts affirm about epistemic plurality and more who defines the problem, who establishes the method, which validity criteria are mobilised and what place is attributed to Indigenous, traditional and territorial knowledges.

The analytical position adopted starts from rescordia (BASTOS, 2026). This standpoint corresponds neither to an abstract distance from the academy nor to an unproblematic adherence to its established criteria. It is a matter of traversing the field from within, observing its silent prevalences, its centres of translation and its forms of partial recognition. One writes to the Academy and about it, but from the epistemological experience of the Karão Jaguaribaras.

From this perspective, academic agroecology is interrogated in its capacity to redistribute epistemic authority. The presence of Indigenous and traditional knowledges in the texts is not taken, in itself, as evidence of rupture. The analysis starts from the hypothesis that these knowledges may be admitted as source, repertoire, illustration, empirical experience or symbol of decolonisation, without occupying the place of a structuring criterion of knowledge.

It is in this mismatch between critical enunciation and effective validation that the concept of subemotépübi emerges. The term designates the micro-recognition granted to non-hegemonic knowledges and subjects when these are formally admitted but remain prevented from organising the method, the authority and the validity regime of the text. Recognition exists, but it does not effectively displace the epistemological centre of academic production.

The aim of this study was to analyse the predominant epistemological regime in academic agroecology through the Epistemic Capture Matrix and the Epistemic Capture Index, observing how the analysed production aligns, groups, subordinates or entangles Indigenous and traditional knowledges, practices and ontologies. The corpus is composed of thirty works intentionally selected among Cadernos de Agroecologia, Scopus and Google Scholar, from an initial search of 372 records.

The contribution of the article is organised on three planes. On the epistemological plane, it identifies the persistence of structural coloniality in the validation criteria of agroecological knowledge. On the methodological plane, it presents the Epistemic Capture Matrix and the Epistemic Capture Index as instruments of comparative reading. On the political-epistemic plane, it proposes Etnoagroecologizar as a concept-method capable of responding to the diagnosis of capture, displacing the validation of knowledge towards a situated relationship with the Território-Ente (Bastos, 2025; 2026).

2 THEORETICAL BACKGROUND

2.1 ANALYTICAL CATEGORIES

The analytical categories mobilised in this article do not function as an abstract repertoire. Território-Ente, Etnoagroecologizar, rescórdia, subemotépübi and digital neo-utilitarianism are proper concepts, formulated by the author in the course of the research and treated as authorial elaboration in academic circulation in press (Bastos *et al.*, 2025a; Bastos *et al.*, 2025b). They arose less as new words than as the need to name that which, without a name, continues to pass as normality: silent capture, the minimal concession, the translation that embraces and, at the same time, disarms.

To avoid terminological dispersion, this article takes as its central axis the Epistemic Capture Matrix, the Epistemic Capture Index and subemotépübi. The remaining categories operate as interpretative support. Rescórdia situates the place of enunciation; digital neo-utilitarianism assists the reading of scientific circulation; Território-Ente grounds the ontological displacement; and Etnoagroecologizar formulates the methodological response to the diagnosis of capture. The architecture is therefore concentrated: a few concepts conduct the analysis, while the others open the passages necessary for the field not to be read merely by its discursive surface.

The first supporting category is rescórdia. It designates the place of friction between paradigms that neither annul each other nor harmonise artificially. Rescórdia allows one to observe academic agroecology from within, without abandoning critique, and from without, without simulating absolute exteriority. It is the space in which the thesis positions itself before

the Academy: not to reject it entirely, but to reveal the conditions under which it recognises, translates or kidnaps original knowledges. At this edge, disagreement ceases to be noise and becomes a method of listening.

The second category is digital neo-utilitarianism. In its originating chapter, this concept is articulated with the utilitarian paradigms of Bentham (1974) and Mill (1859) and designates the contemporary regime of scientific circulation mediated by indexing, ranking, recurrence and formal adequacy.

Although algorithms and databases do not possess their own intention, their logic favours productions adjusted to stabilised formats of scientificity. Thus, investigating academic agroecology requires asking not only what is published, but what becomes visible, repeatable and recognisable as science.

The third category is *submotépübi*. The term designates the micro-recognition granted to Indigenous or traditional subjects, knowledges and ontologies when these appear in the text but do not reorganise its epistemic authority. *Submotépübi* occurs when the Indigenous presence is admitted as source, symbol, experience or repertoire, while the final validation remains academic, technical or institutional. It is a presence formally recognised but not authorised to displace the centre of validation of knowledge.

The fourth category is *Território-Ente*. In the horizon of the *Karão Jaguaribaras*, the territory is not a setting, context, resource or productive variable. It is living presence, active memory and a normative instance orienting practices and knowledges. When the territory is recognised as an *Ente* (Being), the very validation regime is displaced, for truth ceases to be merely demonstrated by an external protocol and comes to be lived, situated and regulated by the relations that sustain collective continuity.

The fifth category is *Etnoagroecologizar*. The concept arises as a noun-action and concept-method, linked to the experience with the onto-epistemology of the *Karão Jaguaribaras*. *Etnoagroecologizar* consists in analysing agroecological practice articulated with its ontological, epistemic, symbolic, ancestral and communal dimension.

It is not a matter of applying agroecology to original peoples, but of recognising that cultivation, education, cosmology, territoriality and transmission form one and the same fabric of existence and knowledge. Its function in this article is to respond to the problem identified by the matrix: if capture concentrates epistemic authority in the academic grammar, *Etnoagroecologizar* displaces validation towards the territory, collective memory and the peoples' own ways of producing knowledge.

2.2 ACADEMIC AGROECOLOGY AND STRUCTURAL COLONIALITY

Academic agroecology historically feeds on the resistance of traditional communities, on the critique of the productivist paradigm and on the denunciation of the socio-environmental effects of agricultural modernisation. However, this critical origin does not, in itself, guarantee an epistemological rupture with the validation regimes inherited from Eurocentred modernity. The field may incorporate the language of plurality without redistributing the authority that decides what counts as knowledge.

This tension is already announced in the warning of Norgaard and Sikor (2002), when they indicate that agricultural scientists and agroecologists are not always aware of the subordination of their research to the dominant method. The critique of productivism does not necessarily mean a critique of the modes of scientific validation that sustain the very organisation of research.

The problem, therefore, does not lie merely in the absence of original peoples or traditional communities in the corpus. In many cases, they appear. The question is the way in which they appear: as empirical context, cultural resource, example of sustainable practice, testimony, ancestrality evoked as epistemic authority effectively capable of reorganising the method and the validation criteria of knowledge. The difference between presence and authority is the axis of the analysis.

In this sense, the structural coloniality of academic agroecology is not manifested only in explicit declarations of scientific superiority. It operates through silent prevalences, naturalised validation criteria and reiterated forms of translation that maintain academic grammar as the final instance of intelligibility. Even when the text celebrates traditional knowledges, it may re-inscribe them in the condition of object of interpretation rather than as structuring foundation of the epistemological regime itself.

2.3 EPISTEMIC CAPTURE MATRIX AND EPISTEMIC CAPTURE INDEX

The Epistemic Capture Matrix was built as an instrument of ordinal qualitative coding. Its purpose is to identify, in each work of the corpus, the place occupied by Indigenous, traditional and territorial knowledges within the regime of scientific validation. The matrix does not measure only presence or absence; it seeks to locate who defines the problem, who validates the knowledge and what function is attributed to the territory.

Seven analytical dimensions were established: Validation Regime (VR), Indigenous or Traditional Presence (IP), Predominant Epistemology (E), Epistemic Authority (EA), Relationship with the Territory (RT), Epistemic Capture (EC) and Micro-recognition, or subemotépübi (MR).

In the Validation Regime, the scale ranges from VR1 to VR5. VR1 indicates exclusive academic validation; VR2, academic validation with referential incorporation of Indigenous or traditional knowledges; VR3, asymmetrical hybrid validation; VR4, shared hybrid validation; and VR5, structuring territorial-Indigenous validation.

In Indigenous or Traditional Presence, IP0 indicates absence; IP1, superficial mention; IP2, empirical incorporation; IP3, analytical participation; and IP4, epistemic protagonism. This dimension allows distinguishing the mere evocation of Indigenous or traditional subjects from their effective action in the architecture of the knowledge produced.

In Predominant Epistemology, four categories were adopted: AE, academic epistemology; HE, hybrid epistemology; TE, territorial epistemology; and IE, Indigenous epistemology. As for Epistemic Authority, EA1 corresponds to academic authority; EA2, technical-institutional; EA3, communal; EA4, shared; and EA5, Indigenous.

The Relationship with the Territory was classified from RT0 to RT5. RT0 indicates absence of the territory as an analytical dimension; RT1, territory as context; RT2, territory as resource; RT3, territory as sociocultural relation; RT4, territory as normative instance; and RT5, territory recognised as Território-Ente.

In Epistemic Capture, EC0 indicates absence of capture; EC1, conceptual extraction; EC2, academic translation; EC3, epistemic erasure; and EC4, methodological coloniality. Finally, Micro-recognition was classified as MR0, non-existent; MR1, symbolic; MR2, partial; and MR3, explicit collective.

The Epistemic Capture Index (ECI) was calculated from the Epistemic Capture variable. Occurrences of capture were considered to be all works classified in the categories EC1, EC2, EC3 and EC4. Works classified as EC0 remained in the denominator but did not integrate the numerator. The formula used was:

$$ICE = \frac{(n_{\{CE1\}} + n_{\{CE2\}} + n_{\{CE3\}} + n_{\{CE4\}})}{N} \quad (1)$$

This index ranges from 0 to 1. The closer to 0, the lower the incidence of epistemic capture; the closer to 1, the greater the recurrence of forms of capture in the corpus. The index does not intend to measure the differentiated intensity between modalities of capture. Its function is to offer a comparative synthesis of the frequency of epistemic capture among documentary bases, analytical sets and general tendencies of the corpus.

3 METHODOLOGY

In accordance with CNPq Ordinance No. 2,664/2026, the use of the autonomous agent Manus AI (version 1.6 Max) in the data analysis stage is declared. The tool was used for the automation and direct execution of data-cleaning scripts in a virtual environment. The

statistical parameters applied, the validation of the generated codes and the critical interpretation of all final results were conducted entirely by the human authors.

The research adopts a qualitative, analytical-comparative and interdisciplinary approach. The methodological design was structured to examine the validation regimes present in the production of academic agroecology, with attention to the treatment given to Indigenous, traditional and territorial knowledges, to ontologies, to the transmission of knowledge and to the epistemic authority attributed to the subjects of the field.

The search strategy was designed with the aim of constituting a comparable corpus of academic publications in agroecology. Three information systems were selected: Cadernos de Agroecologia, for its centrality in the Brazilian agroecological field; Scopus, for its function of international indexing; and Google Scholar, for the breadth of its documentary retrieval.

The search used, in the three databases, the same thematic descriptors associated with academic agroecology, knowledge construction, education for agroecology, epistemology, traditional knowledges, Indigenous knowledges, territory and traditional knowledge.

The query was carried out in Portuguese, French, English and Spanish, in order to broaden the retrieval of works linked to the agroecological debate in different linguistic circuits. The Boolean operators AND and OR were employed, with the aim of ensuring methodological traceability and thematic pertinence of the corpus.

The initial universe gathered 372 works: 117 from Cadernos de Agroecologia, 183 from Scopus and 72 from Google Scholar. Owing to the volume identified, an intentional analytical selection of thirty works was made, distributed equitably among the three systems: ten from Cadernos de Agroecologia, ten from Scopus and ten from Google Scholar.

The selection prioritised texts with greater thematic correspondence to the descriptors, access to the content, pertinence to the epistemological debate and a balanced distribution among the three databases. The inclusion and exclusion criteria derived directly from the descriptors used, with the inclusion of works that presented adherence to the field of academic agroecology and to the discussions on epistemology, territory, Indigenous knowledges, traditional knowledges and knowledge construction; texts without sufficient thematic correspondence or without minimal access to the content necessary for coding were excluded.

Even so, it is acknowledged that this is not an exhaustive systematic review, but a qualitative-comparative analysis of an intentional corpus. In Cadernos de Agroecologia, it is important to record that many works are extended abstracts, with reduced length and, in some cases, the absence of an abstract or full text.

Each selected work constituted a unit of analysis and was coded according to the seven dimensions of the Epistemic Capture Matrix. The coding was qualitative ordinal, applied by a single researcher, based on operational descriptors previously stabilised, in order to reduce impressionistic oscillations and make the comparison between the segments of the corpus more traceable. Reading was integral whenever the full text was available; in cases where the publication was restricted to an extended abstract or presented access limitations, the coding considered the reading of the extended abstract and the available textual elements.

Each textual unit was read according to guiding questions intended to make the matrix more auditable: who validates the knowledge? Who speaks and from which epistemic place? Which knowledge organises the argument? Does the territory appear as setting, resource, sociocultural relation, normative instance or Ente? Is there capture, translation, erasure or epistemic displacement? These questions oriented the passage from qualitative reading to ordinal coding, allowing the matrix to operate not as impressionistic marking but as a comparative instrument for analysing validation regimes.

The methodological procedure also assumes a tension proper to the research: to use demonstrative protocols required by the Eurocentred academy in order to fracture its own prevalence. It is not a matter of full adherence to the dominant validation regime, but of an operation of intellectual and political survival. In this horizon, the matrix functioned simultaneously as an analytical instrument and as a critique of the very academic conditions of the legitimization of knowledge.

4 RESULTS AND DISCUSSION

4.1 DISTRIBUTION OF EPISTEMIC CAPTURE IN THE CORPUS

The application of the Epistemic Capture Matrix to the thirty works allowed identifying the distribution of forms of capture, mediation, partial recognition and epistemic displacement in the corpus. The global incidence of epistemic capture was 0.73, a result of twenty-two works classified in the categories EC1, EC2, EC3 or EC4 in a universe of thirty analysed units.

Table 1

Synthesis of the Epistemic Capture Index by analysed database

Analysed database	Works	Epistemic capture	ECI	Predominant tendency
Cadernos de Agroecologia	10	7	0.70	Dialogue of knowledges with mediation

Scopus	10	6	0.60	Gradient between institutionalised critique and territorial fissures
Google Scholar	10	9	0.90	Approximation to situated knowledges with high conceptual extraction
Total	30	22	0.73	Epistemic capture: predominant.

Source: prepared by the author (2026).

This result indicates that epistemic capture appears as a predominant, though not absolute, tendency. The corpus does not reveal a homogeneous totality of capture, but a gradient of positions in which dominant academic validation, conceptual translation and partial recognition coexist with experiences of fissure, sharing and, in a few cases, a denser displacement of epistemic authority.

The distribution by segment showed a higher incidence of capture in Google Scholar, with an ECI of 0.90. Cadernos de Agroecologia presented an ECI of 0.70, while Scopus recorded an ECI of 0.60. This distribution should not be read as a simple hierarchy among databases, but as an indication of distinct modes of circulation, indexing and mediation of knowledge.

In Google Scholar, the breadth of documentary retrieval revealed more ambiguous forms of capture. Many texts approach situated, Indigenous and territorial knowledges, but do not fully break with the academic frame that organises, translates and legitimates the interpretation. Capture, in this block, is concentrated less in frontal erasure and more in conceptual extraction and partial recognition.

In Cadernos de Agroecologia, the production frequently appears linked to practice, to formative processes, to collective experiences and to territorialities. However, proximity to the territory and to the language of the dialogue of knowledges does not always alter the predominant validation regime. In many cases, territorial knowledges appear as reported experiences, exemplifying practices or empirical evidence of processes classified as agroecological.

In Scopus, a clearer gradient was observed between high-capture texts, institutionalised critical formulations and isolated cases of greater territorial or Indigenous density. Even when the research adopts insurgent or critical methodologies, academic grammar frequently remains the final instance of translation and legitimation. This suggests that epistemological critique can coexist with persistent structures of centralisation of scientific authority.

4.2 MICRO-RECOGNITION AND EPISTEMIC AUTHORITY

The most relevant result of the matrix lies not only in the frequency of capture, but in the place attributed to Indigenous and traditional knowledges when they enter the academic text. The presence of these knowledges does not necessarily equate to the redistribution of epistemic authority. Often, they traverse the page as a respected reference, exemplary practice, memory of resistance or ethical repertoire, but the key that opens and closes legitimacy remains kept by academic grammar.

It is at this point that subemotépübi becomes visible. It appears when original peoples, traditional communities or territorial knowledges are mentioned as important, ancestral, sustainable or resistant, but do not assume the function of establishing the criteria of truth, validity and interpretation. They enter the text, but they do not command its architecture. They are recognised, discursively, yet not authorised to reorganise the epistemological centre of scientific production.

The analysis demonstrated that even Indigenous authorship, when present, does not automatically guarantee a substantial transfer of epistemic authority. A text may contain Indigenous authorship and, even so, remain subordinated to academic protocols that translate, stabilise and validate the experience according to external criteria. Conversely, the audit also showed that the initial matrix had been conservative in recognising epistemic densities effectively present in part of the corpus. The analysed field, therefore, is not reduced to a homogeneous dynamic of capture.

This ambivalence is central. Epistemic capture does not depend only on who signs the text, but on who defines the problem, who orients the method, which ontology structures the interpretation and which validation regime prevails.

For this reason, the Epistemic Capture Matrix does not measure only presence; it also measures position. It asks who speaks, who validates, who translates and who remains as object of translation. The question seems simple, but its effect consists in tensioning the silent mechanisms of legitimation that sustain academic authority.

4.3 THE LATIFUNDIUM OF KNOWLEDGE IN ACADEMIC AGROECOLOGY

The critical synthesis of the results allows understanding academic agroecology as a field traversed by lines of concentration, mediation and fissure. It is neither a homogeneous space of total capture nor a territory already emancipated from its Eurocentric heritage. What becomes evident is a gradient of positions in which the legitimacy of knowledge is distributed unequally.

The expression "latifundium of knowledge" names this concentration of authority. Just as the territorial latifundium concentrates land and regulates access to production, the academic latifundium concentrates the validation criteria and regulates access to scientific legitimacy. Indigenous and traditional knowledges may circulate in this space, but they frequently do so through narrow corridors of translation and conditioned recognition.

In certain strands, epistemic authority remains concentrated in academic and technical-institutional protocols. In others, hybrid compositions arise in which territorial and Indigenous references appear in a denser way, although not always structuring. In rare cases, more consistent displacements towards the effective sharing of the validity of knowledge are observed.

This panorama prevents both the hasty celebration of an already consummated plurality and the reduction of the field to a uniform totality of capture. At the same time, it allows recognising that there are fissures, negotiations and partial displacements within academic agroecology itself. Even so, the analysis demonstrates that the critique of coloniality does not automatically convert into a reorganisation of the validation criteria. To a large extent, the field continues to operate through centres of translation, corridors of legitimacy and zones of mediation in which Indigenous knowledges are admitted but re-inscribed under dominant academic grammar.

4.4 ETNOAGROECOLOGIZAR AS A METHODOLOGICAL PATH

In counterpoint to subemotépübi, the experience with the Karão Jaguaribaras made it possible to structure a distinct configuration of ethnographing and epistemologising the Other. This configuration we name Etnoagroecologizar. The concept is presented neither as a theoretical adornment nor as a poetic closure of the diagnosis. It responds directly to the result of the matrix: where academic agroecology recognises Indigenous knowledges without displacing its centres of validation, Etnoagroecologizar proposes to redistribute the criteria of authority on the basis of the Território-Ente.

Etnoagroecologizar was generated in the course of the research as a noun-action and methodological concept. It is a matter of analysing agroecological practice in its ontological, epistemic, symbolic, ancestral and communal dimension, taking as reference the experiences of the Karão Jaguaribaras. In this horizon, to cultivate, to educate, to transmit, to listen and to inhabit the territory are not separate dimensions; they constitute one and the same fabric of existence, a set of epistemological parameters.

The process with this ethnic group traverses the experience of *être affectée*, in dialogue with Favret-Saada (1977), as a fabric in which interactions are consolidated in

reciprocal dialogues, in the interstices of observations and, often, in silence. The research is not organised as external data collection, but as situated implication, in which the presence of the researcher is also traversed by the territory, by times and by relations.

In this horizon, Território-Ente gains centrality. It is not limited to an interpretative category; it constitutes the ontological foundation of the research itself. The territory participates in the constitution of knowledge, regulates relations, organises times and defines the ethical limits of cultivation and coexistence. When recognised as an Ente, the validation regime is displaced, for truth is not merely demonstrated but lived and situated.

Etnoagroecologizar, therefore, does not merely propose a new nomenclature for agroecological practices. It proposes to reorganise the criteria of validation and production of knowledge on the basis of non-colonised parameters of existence, cultivation and education in the Território-Ente. It is at this point that the diagnosis of capture is converted into a passage towards an epistemological proposition of its own: the critique of the latifundium of knowledge ceases to operate merely as denunciation and comes to indicate a methodology of restitution, listening and territorial co-authorship.

5 CONCLUSION

The article analysed academic agroecology from the tension between its critical self-declaration and its effective validation regimes. The application of the Epistemic Capture Matrix and the Epistemic Capture Index allowed observing that the field does not present itself as a homogeneous totality, but as a space traversed by capture, mediation, partial recognition, fissures and occasional displacements. There are paths. There are fences. There are also narrow passages through which epistemic authority begins to move.

The global result of the ECI, equal to 0.73, indicates that epistemic capture remains predominant in the analysed corpus. The presence of Indigenous, traditional and territorial knowledges does not, in itself, guarantee a redistribution of epistemic authority. In most of the texts, these knowledges appear as reference, repertoire or empirical source, while the validation criteria remain linked to dominant academic grammar. Recognition, when it does not alter the validation regimes and the methodological criteria of knowledge, runs the risk of operating merely as a critical ornament.

The analysis of subemotépübi revealed that it can operate as a subtle form of maintenance of coloniality. The knowledge is recognised, but the centre that interprets it is not displaced; presence is admitted, but authority is not redistributed; the territory is invoked, but it is not always allowed to operate as a normative instance of knowledge. The fissure exists, but not every fissure breaks the wall. Some merely allow the wall to keep breathing.

In this way, the expression "latifundium of knowledge" synthesises this configuration. Academic agroecology, even when critical of productivism, can keep the criteria of scientific legitimacy concentrated.

However, the corpus also reveals fissures: there are texts in which Indigenous, territorial or communal knowledges appear not merely as object, but as foundation of the production of knowledge. This difference is decisive, for it displaces the analysis from presence to authority, from inclusion to validation, from declared listening to the effective reorganisation of the field.

It is in this interval between capture and fissure that Etnoagroecologizar emerges as a methodological path. The experience with the Karão Jaguaribaras, structured on the basis of the Território-Ente, makes it possible to propose an active, situated and relational epistemology, capable of tensioning the protocols that maintain the intellectual prevalence of established ideas.

The article concludes that overcoming the latifundium of knowledge in academic agroecology requires more than the dialogue of knowledges: it requires the effective redistribution of epistemic authority, the recognition of the territory as an Ente and the construction of validation criteria that do not kidnap original knowledges in the form of academic translation.

As a methodological contribution, the Epistemic Capture Matrix and the Epistemic Capture Index can be adapted to other interdisciplinary fields that declare themselves pluri-epistemic, intercultural or decolonial, but remain organised by academic-centred validation criteria.

Thus, their pertinence lies not in producing a neutral measure of capture, but in making visible the forms by which the recognition of non-hegemonic knowledges can coexist with the permanence of colonial centres of authority. The horizon of the article, therefore, is not to close the discussion, but to open a passage so that critique may operate as an instrument of listening and so that listening may reorganise the modes of producing and validating knowledge.

ABSTRACT

INTRODUCTION: Climate change represents one of the greatest global challenges of the 21st century, directly affecting human health, ecosystems, and food systems. Changes in temperature patterns, precipitation, and the occurrence of extreme weather events compromise agricultural production, the availability of natural resources, and the stability of supply chains, thereby impacting Food and Nutrition Security (FNS). These effects are particularly significant in developing countries, where socially vulnerable populations are highly dependent on productive systems sensitive to climate variability. In this context, understanding the interfaces among health, the environment, and society is essential to support adaptation and mitigation strategies aligned with the Sustainable Development Goals (SDGs), especially SDG 2 (Zero Hunger and Sustainable Agriculture), SDG 3 (Good Health and Well-Being), and SDG 13 (Climate Action). **OBJECTIVE:** To analyse, through a literature review, the effects of climate change on food and nutrition security, highlighting its interfaces with health, the environment, and society, as well as its impacts on food availability, access, quality, and stability. **METHODOLOGY:** This study consists of a literature review conducted

through systematic searches in the PubMed, LILACS, and SciELO databases. Articles published between 2020 and 2025 were selected based on thematic relevance, recency, and alignment with the study objectives. The final sample comprised 10 scientific studies, which were analysed using a descriptive and interpretative approach to identify evidence, convergences, and gaps related to the impacts of climate change on food and nutrition security. **RESULTS:** The analysed studies demonstrated that climate change significantly affects food systems by reducing agricultural productivity, causing biodiversity loss, degrading water resources, and altering the nutritional quality of foods. Extreme events such as droughts, floods, and heatwaves were associated with increased food insecurity, rising food prices, and the worsening of social and health inequalities. Furthermore, climate-related impacts were found to increase the vulnerability of populations living in poverty, contributing to a higher risk of malnutrition, food insecurity, and environmentally related diseases. **CONCLUSIONS:** Climate change exerts both direct and indirect influences on food and nutrition security, constituting a major challenge for public health, environmental sustainability, and social development. The findings highlight the need for integrated public policies, strengthened climate governance, the promotion of resilient and sustainable food systems, and the implementation of adaptation strategies capable of reducing vulnerabilities and protecting populations most exposed to environmental impacts. Understanding the interconnections among health, the environment, and society is essential for developing effective responses to the challenges posed by climate change.

RESUMO

INTRODUÇÃO: As mudanças climáticas constituem um dos maiores desafios globais do século XXI, repercutindo diretamente sobre a saúde humana, os ecossistemas e os sistemas alimentares. Alterações nos padrões de temperatura, precipitação e ocorrência de eventos climáticos extremos comprometem a produção agrícola, a disponibilidade de recursos naturais e a estabilidade das cadeias de abastecimento, impactando a Segurança Alimentar e Nutricional (SAN). Esses efeitos são particularmente relevantes em países em desenvolvimento, onde populações socialmente vulneráveis apresentam maior dependência de sistemas produtivos sensíveis às variações climáticas. Nesse contexto, torna-se fundamental compreender as interfaces entre saúde, meio ambiente e sociedade para subsidiar estratégias de adaptação e mitigação alinhadas aos Objetivos de Desenvolvimento Sustentável (ODS), especialmente os ODS 2 (Fome Zero e Agricultura Sustentável), 3 (Saúde e Bem-Estar) e 13 (Ação Contra a Mudança Global do Clima). **OBJETIVO:** Analisar, por meio de revisão da literatura, os efeitos das mudanças climáticas sobre a segurança alimentar e nutricional, destacando suas interfaces com a saúde, o meio ambiente e a sociedade, bem como os impactos na disponibilidade, acesso, qualidade e estabilidade dos alimentos. **METODOLOGIA:** Trata-se de uma revisão da literatura realizada a partir de buscas sistematizadas nas bases de dados PubMed, LILACS e SciELO. Foram selecionados artigos publicados entre 2020 e 2025, considerando critérios de relevância temática, atualidade e aderência aos objetivos da pesquisa. A amostra final foi composta por 10 estudos científicos, analisados por meio de abordagem descritiva e interpretativa, buscando identificar evidências, convergências e lacunas relacionadas aos impactos climáticos sobre a segurança alimentar e nutricional. **RESULTADOS:** Os estudos analisados evidenciaram que as mudanças climáticas afetam significativamente os sistemas alimentares, promovendo redução da produtividade agrícola, perda da biodiversidade, degradação dos recursos hídricos e alterações na qualidade nutricional dos alimentos. Eventos extremos, como secas, enchentes e ondas de calor, foram associados ao aumento da insegurança alimentar, à elevação dos preços dos alimentos e ao agravamento das desigualdades sociais e de saúde. Além disso, observou-se que os impactos climáticos ampliam a vulnerabilidade de grupos

populacionais em situação de pobreza, contribuindo para o aumento do risco de desnutrição, insegurança alimentar e doenças relacionadas às condições ambientais. **CONSIDERAÇÕES FINAIS:** Conclui-se que as mudanças climáticas exercem influência direta e indireta sobre a segurança alimentar e nutricional, configurando-se como um importante desafio para a saúde pública, a sustentabilidade ambiental e o desenvolvimento social. Os resultados reforçam a necessidade de políticas públicas integradas, fortalecimento da governança climática, promoção de sistemas alimentares resilientes e sustentáveis e implementação de estratégias de adaptação capazes de reduzir vulnerabilidades e proteger populações mais expostas aos impactos ambientais. Compreender as conexões entre saúde, meio ambiente e sociedade é essencial para a construção de respostas efetivas frente aos desafios impostos pelas mudanças climáticas.

RESUMEN

INTRODUCCIÓN: El cambio climático constituye uno de los mayores desafíos globales del siglo XXI, repercutiendo directamente sobre la salud humana, los ecosistemas y los sistemas alimentarios. Las alteraciones en los patrones de temperatura, precipitación y ocurrencia de eventos climáticos extremos comprometen la producción agrícola, la disponibilidad de recursos naturales y la estabilidad de las cadenas de abastecimiento, impactando la Seguridad Alimentaria y Nutricional (SAN). Estos efectos son particularmente relevantes en países en desarrollo, donde las poblaciones socialmente vulnerables presentan mayor dependencia de sistemas productivos sensibles a las variaciones climáticas. En este contexto, resulta fundamental comprender las interfaces entre salud, medio ambiente y sociedad para fundamentar estrategias de adaptación y mitigación alineadas con los Objetivos de Desarrollo Sostenible (ODS), especialmente los ODS 2 (Hambre Cero y Agricultura Sostenible), 3 (Salud y Bienestar) y 13 (Acción por el Clima). **OBJETIVO:** Analizar, mediante una revisión de la literatura, los efectos del cambio climático sobre la seguridad alimentaria y nutricional, destacando sus interfaces con la salud, el medio ambiente y la sociedad, así como los impactos en la disponibilidad, acceso, calidad y estabilidad de los alimentos. **METODOLOGÍA:** Se trata de una revisión de la literatura realizada a partir de búsquedas sistematizadas en las bases de datos PubMed, LILACS y SciELO. Se seleccionaron artículos publicados entre 2020 y 2025, considerando criterios de relevancia temática, actualidad y adherencia a los objetivos de la investigación. La muestra final estuvo compuesta por 10 estudios científicos, analizados mediante un enfoque descriptivo e interpretativo, buscando identificar evidencias, convergencias y lagunas relacionadas con los impactos climáticos sobre la seguridad alimentaria y nutricional. **RESULTADOS:** Los estudios analizados evidenciaron que el cambio climático afecta significativamente los sistemas alimentarios, promoviendo la reducción de la productividad agrícola, la pérdida de biodiversidad, la degradación de los recursos hídricos y alteraciones en la calidad nutricional de los alimentos. Eventos extremos, como sequías, inundaciones y olas de calor, fueron asociados al aumento de la inseguridad alimentaria, al alza de los precios de los alimentos y al agravamiento de las desigualdades sociales y de salud. Además, se observó que los impactos climáticos amplían la vulnerabilidad de grupos poblacionales en situación de pobreza, contribuyendo al aumento del riesgo de desnutrición, inseguridad alimentaria y enfermedades relacionadas con las condiciones ambientales. **CONSIDERACIONES FINALES:** Se concluye que el cambio climático ejerce influencia directa e indirecta sobre la seguridad alimentaria y nutricional, configurándose como un importante desafío para la salud pública, la sostenibilidad ambiental y el desarrollo social. Los resultados refuerzan la necesidad de políticas públicas integradas, fortalecimiento de la gobernanza climática, promoción de sistemas alimentarios resilientes y sostenibles e implementación de estrategias de adaptación capaces de reducir vulnerabilidades y proteger a las poblaciones

más expuestas a los impactos ambientales. Comprender las conexiones entre salud, medio ambiente y sociedad es esencial para la construcción de respuestas efectivas frente a los desafíos impuestos por el cambio climático.

1 INTRODUCTION

Climate change constitutes one of the most complex and interdependent contemporary challenges faced by humanity, owing to its systemic impacts on natural ecosystems, productive systems, and socioeconomic dynamics. The increase in global average temperature, estimated at approximately 1.1 °C above pre-industrial levels, has been accompanied by the intensification of the frequency and magnitude of extreme weather events, such as prolonged droughts, heatwaves, floods, and severe storms (IPCC, 2021). These phenomena have caused significant changes in hydrological cycles, soil fertility, and agricultural productivity, directly compromising the stability of food systems. As a consequence, a worsening of food and nutrition insecurity on a global scale is observed, evidenced by the increase in the number of people facing hunger, which exceeds 700 million, according to recent estimates (FAO *et al.*, 2023).

The scientific literature is consistent in demonstrating that the impacts of climate change are unevenly distributed, affecting socially vulnerable populations more intensely. Developing countries, such as Brazil, present greater exposure and sensitivity to climate risks due to the combination of structural factors, including a high dependence on economic activities based on natural resources, persistent socioeconomic inequalities, and limitations in social protection and adaptation systems (Alpino *et al.*, 2022).

In this context, vulnerability is understood as the result of the interaction between exposure to risks, sensitivity of systems, and adaptive capacity, which contributes to the deepening of inequalities in health and nutrition. Thus, climate change not only intensifies food insecurity but also widens social inequities, constituting a critical determinant of public health in the 21st century (Santos; Duarte, 2022).

The impacts of climate change on food and nutrition security (FNS) are amplified by structural socioeconomic determinants, such as poverty, unemployment, rising food prices, limited access to land, and environmental degradation. These factors act in a synergistic and interdependent manner, intensifying the vulnerability of populations already exposed to precarious living conditions and compromising the human right to adequate food (Monteiro *et al.*, 2022).

Recent estimates indicate that, in 2022, between 691 and 783 million people faced hunger worldwide, reflecting a worsening of food insecurity conditions associated, among other factors, with climate change and global economic crises (FAO *et al.*, 2023).

There is consensus in the scientific literature that climate change intensifies the adverse effects on FNS, simultaneously affecting its four pillars: availability, access, utilisation, and stability of food. Evidence indicates that such impacts manifest

disproportionately among low-income populations, widening pre-existing social and nutritional inequalities (Santos; Duarte, 2022).

In this context, extreme weather events, such as prolonged droughts and floods, have been associated with increased acute food insecurity, especially in tropical and subtropical regions, where dependence on climate-sensitive agricultural systems is more pronounced (Santos *et al.*, 2023).

Food and Nutrition Security is defined as the condition in which all people have regular and permanent physical, social, and economic access to safe and nutritious food, in sufficient quantity, to meet their dietary needs and preferences, without compromising other essential needs (HLPE, 2022).

This concept is based on four interdependent pillars: availability, access, biological utilisation, and stability over time, which are directly influenced by environmental, economic, and social factors (FAO *et al.*, 2023).

The pillar of availability, in turn, presents high sensitivity to climate variability, since it is directly related to agricultural production, storage, logistics, and food trade. Changes in precipitation regimes, increases in global average temperatures, and greater frequency of extreme weather events have negatively impacted agricultural productivity. According to the IPCC, significant reductions in the yield of essential crops, such as maize and wheat, are already observed in various regions of the world, which compromises food supply and increases the volatility of food systems (IPCC, 2021).

Access to food, within the scope of Food and Nutrition Security (FNS), is defined as the physical, economic, and social capacity of individuals and populations to acquire adequate food in sufficient quantity and quality. This component is strongly influenced by economic determinants, such as income, relative food prices, and market functioning. Climate change interferes with this pillar by causing fluctuations in agricultural production and disruptions in supply chains, resulting in rising prices and reduced purchasing power, especially among low-income populations, who allocate a greater proportion of their income to food (FAO *et al.*, 2023; Salvajo *et al.*, 2023).

Food utilisation refers to the way the organism makes use of the ingested nutrients, being conditioned by the nutritional quality of foods, dietary practices, and conditions of health, sanitation, and access to potable water. Recent evidence indicates that the increase in atmospheric concentrations of carbon dioxide (CO₂), associated with thermal stress, may significantly reduce the content of essential micronutrients such as iron, zinc, and proteins in basic crops, compromising the nutritional value of foods and increasing the risks of nutritional deficiencies, particularly in vulnerable populations (Myers *et al.*, 2020).

The pillar of food stability concerns the capacity of food systems to ensure continuous access to food over time, even in the face of external shocks of a climatic, economic, or social nature. In this sense, extreme weather events, such as prolonged droughts, floods, and heatwaves, affect the regularity of food production and distribution, increasing price volatility and the frequency of episodes of food insecurity, particularly in regions with lower adaptive capacity (IPCC, 2022; Alpino *et al.*, 2022).

In Brazil, Food and Nutrition Security is normatively established by the Lei Orgânica de Segurança Alimentar e Nutricional (LOSAN), which recognises adequate food as a fundamental human right. This legal framework establishes FNS as an intersectoral public policy. However, recent evidence points to setbacks in national indicators, with a resurgence of food insecurity, aggravated by simultaneous climatic, economic, and health crises that weaken institutional response capacity and widen inequalities (Brasil, 2021; Rede Penssan, 2022).

Nutritional vulnerability may be conceptualised as the condition in which individuals or groups are exposed to risk factors that compromise regular access to adequate food, associated with a limited capacity to cope and adapt. It is a multidimensional construct, influenced by social, economic, and environmental determinants. Climate change intensifies this vulnerability by increasing exposure to risks, reducing the availability of resources, and limiting adaptive strategies, especially in contexts of structural inequality (Monteiro *et al.*, 2022; Santos *et al.*, 2023).

According to the IPCC, climate vulnerability results from the interaction between three fundamental dimensions: exposure to risks, sensitivity of systems, and adaptive capacity. Within this framework, populations living in poverty, family farmers, traditional communities, and residents of peripheral urban areas present greater susceptibility to climate impacts, due to the combination of high exposure and limited adaptive capacity (IPCC, 2021; FAO *et al.*, 2023).

Family farming, in the Brazilian context, constitutes a strategic component of FNS, being responsible for a significant share of the production of fresh food destined for domestic consumption. However, its high dependence on climatic conditions and its limited capacity to access technologies and credit make this sector particularly sensitive to changes in temperature and precipitation regimes, which compromises its productivity and sustainability (IBGE, 2020; Alpino *et al.*, 2022).

The expansion of the agricultural frontier, associated with deforestation and the predominance of productive systems based on monocultures, configures a development model that contributes to environmental degradation and to the worsening of climate change.

This process establishes a cycle of negative feedback, in which the degradation of ecosystems reduces environmental resilience and compromises the sustainability of food systems (Duarte; Santos, 2022; IPCC, 2022).

Extreme weather events, whose frequency and intensity have increased since the mid-20th century, represent one of the main manifestations of climate change. Phenomena such as heatwaves, severe droughts, floods, and wildfires directly impact food production, in addition to affecting human health, infrastructure, and the quality of life of populations, configuring a scenario of systemic risk (Salvajo *et al.*, 2023; IPCC, 2021).

Climate projections indicate that, even in scenarios of moderate mitigation, the increase in global temperature will continue to exert significant pressure on food systems. Warming above 2 °C in relation to pre-industrial levels could result in substantial losses of agricultural productivity, increased price volatility, and greater instability in food supply, intensifying the challenges for FNS (IPCC, 2022; FAO *et al.*, 2023).

Given this context, the need for the formulation and implementation of integrated public policies becomes evident, articulating strategies of mitigation and adaptation to climate change with actions aimed at promoting food and nutrition security. Such policies must prioritise the reduction of social inequalities, the protection of natural resources, and the strengthening of sustainable and resilient food systems, in line with the principles of sustainable development (Alpino *et al.*, 2022; Santos; Duarte, 2022).

Climate change has caused structural transformations in global food systems, affecting in an integrated manner the stages of food production, processing, distribution, and consumption. This phenomenon is embedded in a context of environmental and socioeconomic transition, in which the increase in global average temperature, the alteration of precipitation regimes, and the intensification of extreme weather events have compromised the stability of productive systems. Such changes directly affect food and nutrition security (FNS), increasing the exposure of populations to risks of scarcity, instability in supply, and deterioration of food quality (IPCC, 2021; HLPE, 2022).

Within the scope of food systems, agricultural production constitutes a critical component, highly sensitive to climate variability. Factors such as thermal stress, water irregularity, and soil degradation negatively affect crop yields, especially in tropical and subtropical regions, where production strongly depends on natural climatic conditions. This scenario compromises not only the quantity produced but also the predictability of food supply, weakening the security of agricultural systems and the sustainability of rural livelihoods (Myers *et al.*, 2020; Santos *et al.*, 2023).

In addition to the quantitative impacts, climate change also qualitatively affects the available foods. Studies indicate that the increase in the atmospheric concentration of carbon dioxide (CO₂), associated with conditions of environmental stress, may significantly reduce the content of essential micronutrients, such as iron, zinc, and proteins, in basic food crops. This phenomenon compromises the nutritional quality of diets, especially in populations that depend heavily on these foods, contributing to the worsening of nutritional deficiencies and to the deterioration of public health indicators (Myers *et al.*, 2020; Fanzo *et al.*, 2022).

Climate instability also exerts a direct influence on food supply chains, interfering with logistical processes, storage, and food distribution. Extreme weather events, such as floods, prolonged droughts, and storms, disrupt production and transport flows, raise operational costs, and impact price formation. As a result, a reduction in economic access to food is observed, especially among low-income populations, who present greater vulnerability to market fluctuations and lower capacity to absorb economic shocks (HLPE, 2022; Naicker *et al.*, 2025).

In this context, food insecurity is not restricted to the physical insufficiency of food but also encompasses the limitation of access to healthy and nutritionally adequate diets. Evidence points out that climate change contributes to the rising cost of nutritious foods, making balanced diets less accessible and widening nutritional inequalities between different social groups. This process reinforces the coexistence of multiple forms of malnutrition, such as undernutrition, micronutrient deficiency, and overweight, configuring a scenario of complex nutritional transition (Springmann *et al.*, 2021; Lloyd *et al.*, 2024).

Populations in situations of socioeconomic vulnerability present lower adaptive capacity in the face of climate impacts, owing to structural limitations that include low income, lower educational attainment, precarious insertion in the labour market, and fragility of social protection policies. These factors condition exposure and sensitivity to risks, widening the adverse effects of climate change on food and nutrition security and deepening already existing inequalities (Alpino *et al.*, 2022; Monteiro *et al.*, 2022).

In the Brazilian context, these vulnerabilities are intensified by marked regional inequalities and by the significant dependence on family farming for domestic food supply. Although this sector plays a strategic role in food production, its high sensitivity to climatic conditions and its limited access to technologies and credit make it particularly susceptible to changes in temperature and precipitation patterns. As a consequence, events such as droughts, rainfall irregularity, and heatwaves compromise the productivity, income, and food security of rural populations (IBGE, 2020; Silva *et al.*, 2024).

Recent reports show that extreme weather events have become more frequent and intense across Brazilian territory, affecting both rural and urban areas. These events directly impact food security by causing agricultural losses, compromising supply infrastructure, and affecting food distribution logistics, in addition to generating indirect effects on the health and living conditions of the population (Salvajo *et al.*, 2023; IPCC, 2021).

The scientific literature highlights that the impacts of climate change on FNS result from the complex interaction between environmental, economic, and social factors, and cannot be analysed in isolation. Thus, food insecurity should be understood as a multidimensional and dynamic phenomenon, whose intensity is amplified by the contemporary climate context and by structural inequalities (Fanzo *et al.*, 2022; Santos; Duarte, 2022).

Given this scenario, the formulation of integrated public policies becomes imperative, articulating strategies of mitigation and adaptation to climate change with actions aimed at promoting food and nutrition security. These policies should prioritise the reduction of social inequalities, the strengthening of local food systems, the protection of natural resources, and the adoption of sustainable agricultural practices, contributing to the construction of more resilient and equitable systems (HLPE, 2022; Silva *et al.*, 2024).

Additionally, the existence of relevant gaps in scientific production is observed, especially regarding the integrated analysis between extreme weather events and nutritional vulnerability in low-income populations. The identification of these gaps highlights the need for studies that deepen the understanding of the interrelations between climate, food, and social inequalities, supporting the formulation of more effective strategies to combat food insecurity (Naicker *et al.*, 2025; Lloyd *et al.*, 2024).

Thus, the understanding of the impacts of climate change on food and nutrition security, in the light of multiple determinants and different socioeconomic contexts, proves fundamental to support public policies and adaptation strategies capable of reducing inequalities and promoting more resilient and sustainable food systems (IPCC, 2021; Fanzo *et al.*, 2022).

From this perspective, the VigiSAN survey, conducted in 2021 by the Rede Brasileira de Pesquisa em Soberania e Segurança Alimentar e Nutricional (PenSSAN), evidenced the magnitude of food insecurity in Brazil. Approximately 55% of Brazilian households experienced some degree of food insecurity, with around 9% being in a severe situation. This condition proved more pronounced in rural areas, reaching approximately 12% of households. Furthermore, only 44% of the population presented full access to food security, evidencing the worsening of inequalities in the country (PenSSAN, 2021; FAO, 2022).

2 THEORETICAL FRAMEWORK

Concept of Food and Nutrition Security

Food and Nutrition Security (FNS) constitutes a central concept in the global agendas of public health and sustainable development, being defined as the condition in which all people have regular and permanent physical, social, and economic access to safe food, of quality and in sufficient quantity to meet their nutritional needs and dietary preferences, without compromising other essential needs. It is a multidimensional construct that transcends the mere availability of food, incorporating aspects related to equity, sustainability, and human dignity, in line with the principles of the Human Right to Adequate Food (FAO *et al.*, 2023; HLPE, 2022).

The conceptual framework of FNS is structured around four interdependent pillars: availability, access, utilisation, and stability. Availability refers to the physical existence of food, resulting from agricultural production, stocks, and trade; access is related to the economic and social capacity to acquire these foods; utilisation involves nutritional quality, dietary practices, and the health conditions that allow adequate biological use of nutrients; and stability concerns the continuity of these conditions over time, even in the face of external shocks. These pillars operate in an integrated manner, being mutually dependent for the guarantee of food security (HLPE, 2022; FAO *et al.*, 2023).

The pillar of food availability is intrinsically linked to the dynamics of productive systems and to environmental conditions, including climatic, technological, and economic factors. Agricultural production, the main source of food supply, depends on variables such as soil fertility, water availability, and adequate climatic conditions, which makes this pillar particularly sensitive to environmental changes and to processes of ecological degradation. Thus, the guarantee of food availability is directly associated with the sustainability of agricultural systems and with the capacity for large-scale production (FAO *et al.*, 2023).

Access to food, in turn, is strongly conditioned by socioeconomic determinants, such as income, food prices, market functioning, and public social protection policies. Even in contexts of adequate availability, food insecurity may persist due to the inability of certain social groups to acquire sufficient and nutritious food, evidencing the centrality of social inequalities in the determination of FNS. In this sense, access constitutes one of the main points of vulnerability in contemporary food systems (HLPE, 2022).

In the Brazilian context, Food and Nutrition Security is institutionalised by the Lei Orgânica de Segurança Alimentar e Nutricional (LOSAN), which recognises adequate food as a fundamental human right and establishes FNS as a State policy. LOSAN reinforces the need for intersectoral actions that integrate health, social assistance, agriculture, and

education, aiming to guarantee universal access to adequate and healthy food. This approach evidences that FNS should be understood not only as a food issue but as a structuring element of public policies aimed at promoting equity and social justice (Brasil, 2006).

Climate Change: Theoretical Basis

Climate change is defined as long-term alterations in the average patterns of the Earth's climate, including variations in temperature, precipitation, winds, and the occurrence of extreme events. These changes result from both natural processes and anthropogenic influences, it being currently widely recognised that human activities constitute the main driving factor of the transformations observed since the pre-industrial era. The increase in the concentration of greenhouse gases (GHGs) in the atmosphere has intensified the natural greenhouse effect, promoting global warming and triggering systemic impacts on ecosystems and socioeconomic systems (IPCC, 2021; NASA, 2023).

The anthropogenic causes of climate change are directly associated with the burning of fossil fuels, deforestation, agricultural expansion, and changes in land use. These processes result in the emission of carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O), the main gases responsible for global warming. Estimates indicate that the concentration of atmospheric CO₂ has already exceeded 420 ppm, a value significantly higher than pre-industrial levels, reflecting the intensification of human activities and their impacts on the global climate system (IPCC, 2021; NOAA, 2023).

The scientific evidence of climate change is widely documented and includes the increase in global average temperature, the rise in sea level, the melting of glaciers, and the greater frequency and intensity of extreme weather events, such as droughts, floods, heatwaves, and storms. According to the IPCC, the global average temperature has already increased by approximately 1.1 °C in relation to pre-industrial levels, with projections indicating the possibility of exceeding 1.5 °C in the coming decades if there is no significant reduction in GHG emissions (IPCC, 2021; WMO, 2023).

Given this scenario, the concepts of mitigation, adaptation, and resilience stand out as fundamental pillars in confronting climate change. Mitigation refers to strategies aimed at reducing greenhouse gas emissions or increasing carbon sinks, while adaptation involves adjustments in natural and human systems to reduce vulnerability and the damage associated with climate impacts. Resilience, in turn, concerns the capacity of systems to absorb, respond to, and recover from adverse events, maintaining their essential functions (IPCC, 2022; UNFCCC, 2021).

The scientific literature highlights that the integration between mitigation and adaptation is essential for the construction of more resilient and sustainable systems, especially in contexts of high socio-environmental vulnerability. In this sense, public policies and global strategies have emphasised the need for coordinated actions that consider not only the reduction of emissions but also the strengthening of the adaptive capacity of populations and productive systems. This integrated approach is fundamental to minimise the impacts of climate change and to promote sustainable development on a global scale (IPCC, 2022; FAO, 2023; UNEP, 2022).

Impacts of Climate Change

Climate change has significantly impacted food availability by compromising agricultural production in different regions of the world. The increase in global average temperatures, associated with the irregularity of precipitation and the greater incidence of extreme events, such as droughts and floods, has reduced the productivity of essential crops, such as rice, maize, and wheat. Moreover, processes of soil degradation, intensified by inadequate agricultural practices and climate change, contribute to the loss of productive capacity, directly affecting food supply and the sustainability of agricultural systems (IPCC, 2021; FAO *et al.*, 2023).

With regard to access to food, climate change exerts an indirect, yet significant, influence through rising prices and market instability. The reduction in agricultural production, combined with the disorganisation of supply chains, results in increased food costs, impacting low-income populations disproportionately. This scenario widens socioeconomic inequalities and limits access to adequate diets, especially in developing countries, where family income is more sensitive to price fluctuations (HLPE, 2022; Springmann *et al.*, 2021).

Food utilisation, understood as the biological use of nutrients, is also affected by climate change. Scientific evidence indicates that the increase in the concentration of carbon dioxide (CO₂) in the atmosphere is associated with the reduction of the content of essential micronutrients, such as iron and zinc, in basic food crops. This phenomenon compromises the nutritional quality of foods and may aggravate conditions of nutritional deficiency, especially in populations that depend on these foods as their main source of nutrients, negatively impacting public health (Myers *et al.*, 2020; Fanzo *et al.*, 2022).

The pillar of food stability is particularly sensitive to the intensification of extreme weather events. The recurrent occurrence of prolonged droughts, floods, heatwaves, and storms compromises the regularity of food production and distribution, generating instability in supply and greater price volatility. This context increases the frequency of episodes of food

insecurity, especially in regions with low capacity for adaptation and response to climate shocks (IPCC, 2022; FAO *et al.*, 2023).

In an integrated manner, the impacts of climate change on the different pillars of FNS evidence the complexity and interdependence of food systems. The food insecurity resulting from this process is not limited to the scarcity of food but involves economic, nutritional, and social dimensions, configuring a multidimensional phenomenon. In this sense, climate change acts as a factor that amplifies existing inequalities, requiring articulated responses that integrate policies of mitigation, adaptation, and the promotion of sustainable and resilient food systems (Fanzo *et al.*, 2022; HLPE, 2022).

Social Determinants and Vulnerability

The social determinants of health constitute structural factors that influence the living conditions, well-being, and morbidity patterns of populations, being fundamental for the understanding of inequalities in health and nutrition. In this context, variables such as income, educational attainment, occupation, and housing conditions play a central role in the determination of access to essential resources, including adequate food. Poverty, in particular, constitutes one of the main determinants of food insecurity, by limiting the capacity to acquire food of quality and in sufficient quantity, contributing to the perpetuation of intergenerational cycles of vulnerability (WHO, 2010; FAO *et al.*, 2023).

Social inequality, in turn, acts as a structuring factor of health inequities, since it distributes resources and opportunities unevenly among different population groups. In societies marked by a high concentration of income, greater exposure of vulnerable populations to adverse conditions is observed, including food insecurity, housing precariousness, and limited access to health and education services. These disparities reflect not only economic differences but also historical and political processes that condition access to basic rights, widening social vulnerabilities (Solar; Irwin, 2010; Marmot *et al.*, 2020).

Education constitutes a strategic social determinant, since it directly influences the capacity of individuals to access information, make informed decisions, and adopt healthy practices. Higher levels of educational attainment are associated with better health conditions, greater food security, and greater capacity to adapt to adverse contexts, including those related to climate change. On the other hand, low educational attainment limits access to work and income opportunities, reinforcing situations of vulnerability and food insecurity (Cutler; Lleras-Muney, 2010; FAO *et al.*, 2023).

Work and employment conditions also play a determining role in the configuration of social and nutritional vulnerability. Insertion in precarious, informal, or low-wage employment reduces the economic stability of families, compromising regular access to adequate food.

Furthermore, job insecurity and the absence of social protection increase exposure to social and health risks, evidencing the interdependence between labour conditions, income, and food security (ILO, 2021; Monteiro *et al.*, 2022).

Territory, understood as a geographically and socially constructed space, directly influences exposure to risks and the availability of resources, configuring itself as a central element in the analysis of vulnerability. Peripheral regions, isolated rural areas, and territories marked by precarious infrastructure present greater susceptibility to food insecurity and health inequities. In this context, vulnerability may be understood as the result of the interaction between exposure to risks, sensitivity of systems, and adaptive capacity, being strongly influenced by social and environmental determinants. This approach allows health inequities to be understood as complex, multidimensional, and socially determined phenomena (IPCC, 2021; Birkmann *et al.*, 2013).

Extreme Weather Events

Extreme weather events constitute one of the most evident manifestations of contemporary climate change, characterised by the increase in the frequency, intensity, and duration of phenomena such as droughts, floods, and heatwaves. These events have direct implications for natural and socioeconomic systems, significantly affecting food and nutrition security and the health of populations. Scientific evidence indicates that such phenomena have been intensifying since the mid-20th century, as a result of global warming induced by anthropogenic activities (IPCC, 2021; IPCC, 2022).

Prolonged droughts represent one of the main climate events with a direct impact on food production, especially in regions dependent on rainfed agriculture. The reduction in water availability compromises crop development, decreases agricultural productivity, and may lead to the total loss of harvests, affecting food availability and the income of farmers, especially in developing countries. Moreover, water scarcity impacts livestock production and agri-food systems as a whole (FAO *et al.*, 2023; Myers *et al.*, 2020).

Floods, in turn, significantly affect the productive and logistical infrastructure of food systems. Inundations may destroy crops, contaminate soils and water sources, and compromise roads, warehouses, and distribution networks. These impacts result in interruptions in food supply, increased post-harvest losses, and rising prices, hindering access to food, especially for populations in situations of vulnerability (HLPE, 2022; Naicker *et al.*, 2025).

Heatwaves constitute another extreme weather event with relevant repercussions on agricultural production and human health. Elevated temperatures affect crop growth, reduce productivity, and alter the nutritional quality of foods. In the field of health, heatwaves are

associated with an increase in heat-related diseases, dehydration, the worsening of chronic conditions, and a rise in mortality, especially among the most vulnerable groups, such as the elderly and exposed workers (IPCC, 2021; WHO, 2021).

In an integrated manner, extreme weather events compromise the stability of food systems, simultaneously affecting the production, supply, and access to food, in addition to directly impacting the health of populations. These phenomena contribute to the increase in food and nutrition insecurity, especially in contexts of socioeconomic vulnerability, where the capacity for adaptation is limited. Thus, the understanding of these events as critical determinants of health and food security is fundamental for the development of mitigation and adaptation strategies that promote more resilient and sustainable systems (IPCC, 2022; FAO *et al.*, 2023).

Global and Brazilian Scenario

The global scenario of food and nutrition security has deteriorated in recent decades, reflecting the complex interaction between climatic, economic, and geopolitical factors. Recent estimates indicate that between 691 and 783 million people faced hunger worldwide in 2022, evidencing a setback in the advances previously achieved. Furthermore, around 2.4 billion people experienced some degree of food insecurity, which demonstrates the persistence of structural inequalities and the fragility of global food systems in the face of simultaneous crises, such as climate change, conflicts, and economic instability (FAO *et al.*, 2023).

Food insecurity on a global scale is not limited to the quantitative insufficiency of food but also involves the difficulty of access to healthy and nutritionally adequate diets. Studies point out that approximately 3.1 billion people in the world cannot afford the cost of a healthy diet, which reinforces the economic dimension of food insecurity and evidences the unequal distribution of food resources. This scenario is aggravated by the increase in food prices, driven by extreme weather events and by the instability of global supply chains (FAO *et al.*, 2023).

In the Brazilian context, a significant worsening of food insecurity is observed in recent years, characterising a scenario of setback after important advances registered in previous decades. Data from the Inquérito Nacional sobre Insegurança Alimentar no Contexto da Pandemia da COVID-19 (VigiSAN) indicate that, in 2021, approximately 55% of Brazilian households lived with some degree of food insecurity, with around 9% being in a severe situation, characterised by the deprivation of food (Rede PenSSAN, 2021).

Regional inequalities in Brazil intensify this picture, with a higher prevalence of food insecurity in the North and Northeast regions, as well as in rural areas and urban peripheries.

In these regions, factors such as low income, labour informality, and limited access to public social protection policies contribute to greater food vulnerability. Furthermore, Black populations, women heads of family, and traditional communities present a higher risk of food insecurity, evidencing the intersectionality of social inequalities in the country (Rede PenSSAN, 2021; FAO *et al.*, 2023).

Given this panorama, it becomes evident that, both in the global and in the Brazilian scenario, food and nutrition security is profoundly conditioned by structural and contextual determinants. The recent worsening of indicators reflects not only cyclical crises but also systemic fragilities in the models of production, distribution, and access to food. In this sense, the strengthening of public policies, the promotion of sustainable food systems, and the reduction of social inequalities constitute essential strategies for confronting food insecurity at different scales (FAO *et al.*, 2023; Rede PenSSAN, 2021).

Global Agenda and Strategic Responses

Climate change has consolidated itself as one of the main global challenges of the 21st century, repercussing directly on productive systems, human health, and food and nutrition security. In this context, the 2030 Agenda for Sustainable Development emerges as an international strategic framework by integrating economic, social, and environmental goals aimed at overcoming hunger, promoting health, and protecting the planet. Among its objectives, SDG 2 (Zero Hunger and Sustainable Agriculture), SDG 3 (Good Health and Well-Being), SDG 12 (Responsible Consumption and Production), and SDG 13 (Climate Action) stand out, which are directly articulated with the need to transform contemporary food systems into more resilient and inclusive models (ONU, 2015; FAO *et al.*, 2023).

The interdependence between climate, food production, and public health evidences that food insecurity cannot be confronted by isolated actions. Extreme events, such as prolonged droughts, floods, and rising average temperatures, have reduced agricultural productivity, increased post-harvest losses, and pressured food prices, compromising the access of the most vulnerable populations. Such phenomena particularly affect low- and middle-income countries, where dependence on climate-sensitive agricultural systems is greater and social protection mechanisms are still insufficient. Thus, the strengthening of integrated policies becomes essential to mitigate adverse effects and ensure food stability on a global scale (IPCC, 2023; WHO, 2023).

Among the most relevant strategic responses, the promotion of climate-resilient agriculture stands out, characterised by the adoption of productive practices capable of increasing environmental adaptation, reducing greenhouse gas emissions, and ensuring sustainable productivity. Techniques such as efficient water management, crop

diversification, recovery of degraded soils, and the use of adapted seeds have been pointed out as fundamental for expanding the response capacity of territories in the face of environmental changes. In addition to their ecological benefits, such measures contribute to income generation, rural economic stability, and the maintenance of food supply, aligning directly with the goals of SDG 2 and SDG 13 (FAO, 2021; IPCC, 2023).

Agroecology also presents itself as a robust strategy in the simultaneous confrontation of hunger, environmental degradation, and social inequalities. By valuing traditional knowledge, biodiversity, short marketing circuits, and local production, this model strengthens rural communities and promotes healthier and more diversified diets. Moreover, agroecological systems tend to present greater resilience in the face of climate shocks, owing to biological diversity and lower dependence on external inputs. In this sense, agroecology contributes not only to productive sustainability but also to SDG 12, by stimulating responsible patterns of production and consumption (HLPE, 2019; Altieri; Nicholls, 2020).

Finally, the effectiveness of global responses depends on the consolidation of intersectoral public policies and social protection mechanisms that ensure regular access to adequate food, especially in contexts of climate crisis. Income transfer programmes, school feeding, public purchases from family farming, and nutritional surveillance are instruments recognised for reducing vulnerabilities and promoting equity. Thus, the construction of sustainable food systems requires integrated governance among health, agriculture, social assistance, and the environment, reaffirming that the fight against hunger and climate change must occur in a simultaneous and coordinated manner (FAO *et al.*, 2023; Brasil, 2024).

3 METHODOLOGY

The present research is characterised as an integrative literature review, with a qualitative approach, descriptive nature, and exploratory character, developed with the purpose of critically analysing the scientific evidence regarding the impacts of climate change on Food and Nutrition Security (FNS). The choice of this methodological design is based on the possibility of bringing together results from studies with different methodological designs, allowing an expanded synthesis of the knowledge available on a complex and multidimensional theme. According to Gil (2020), bibliographic research enables theoretical deepening, the systematisation of knowledge already produced, and the identification of relevant scientific gaps.

The bibliographic search was carried out systematically in the databases Scientific Electronic Library Online (SciELO), PubMed/MEDLINE, Literatura Latino-Americana e do Caribe em Ciências da Saúde (LILACS), and Biblioteca Virtual em Saúde (BVS), as they

concentrate scientific productions of relevance in the areas of public health, nutrition, epidemiology, and the environment. Additionally, technical documents and institutional reports published by reference international bodies, such as the Food and Agriculture Organization, World Health Organization, and Intergovernmental Panel on Climate Change, were consulted, with a view to complementing the theoretical and contextual basis of the study.

For the search strategy, controlled descriptors from the DeCS (Descritores em Ciências da Saúde) and MeSH (Medical Subject Headings) vocabularies were used, associated with free keywords and the Boolean operators AND and OR. Among the main terms employed, the following stand out: "mudanças climáticas", "segurança alimentar", "insegurança alimentar", "nutrição", "climate change", "food security", "food insecurity", and "nutrition". The combinations of the descriptors were adapted according to the specificities of each database, aiming at greater sensitivity and precision in the retrieval of studies.

The inclusion criteria comprised: a) original scientific articles, systematic reviews, integrative reviews, dissertations, and theses; b) publications available in full; c) studies published between the years 2020 and 2025; d) Portuguese, English, or Spanish languages; e) research that addressed, directly or indirectly, the relationship between climate change and one or more dimensions of Food and Nutrition Security, such as availability, access, biological utilisation of food, food stability, nutritional quality, or population vulnerability. Studies with explicit methodological rigour and scientific relevance to the investigated object were prioritised.

The exclusion criteria involved: a) publications duplicated among the consulted databases; b) simple abstracts, editorials, letters to the editor, opinion essays, and materials without technical review; c) documents without access to the full text; d) studies published outside the established time frame; e) productions that dealt exclusively with climate change without an interface with food and nutrition; f) studies focused only on agricultural economic productivity without relation to food security; and g) articles with methodological inconsistency or insufficiency of analytical data.

The process of selecting the studies occurred in three successive stages: identification, screening, and eligibility. Initially, the reading of the titles was carried out to exclude manifestly irrelevant studies; subsequently, the analysis of the abstracts of the potentially eligible works was conducted; finally, the full reading of the selected publications was carried out, confirming their adherence to the established criteria and to the objective of the review.

After the final selection, the included studies were organised in a standardised extraction instrument containing: authorship, year of publication, country or place of the study, objective, methodological design, main results, and conclusions. The analysis of the data was conducted through thematic content analysis, enabling the identification of recurrent patterns, convergences, and gaps in the literature. The evidence was grouped into analytical categories, such as: climate impacts on food production and supply; economic repercussions on food access; social inequalities and vulnerabilities; nutritional and health effects; and public policies of mitigation and adaptation (Bardin, 2016).

This methodological path confers greater scientific rigour, transparency, and interpretative robustness to the results, allowing an understanding of the current state of knowledge about the impacts of climate change on Food and Nutrition Security and supporting future research, public policies, and intersectoral strategies aimed at promoting health and sustainability.

4 RESULTS / DISCUSSION

The analysis of the reviewed literature evidenced scientific consensus that climate change is configured as one of the main factors of instability of contemporary food systems. The progressive increase in global average temperature, associated with the irregularity of rainfall regimes and the intensification of extreme events, such as droughts, floods, and heatwaves, has compromised agricultural productive capacity in different regions of the world. Such transformations directly affect food availability and increase the risk of food insecurity, especially in low- and middle-income countries, whose adaptive capacity tends to be more limited (IPCC, 2023; Wheeler; Von Braun, 2020).

Within the scope of agricultural and livestock production, it was observed that strategic crops for human food, such as rice, maize, wheat, and legumes, present high sensitivity to climatic changes. Prolonged exposure to water stress, soil degradation, and thermal rise may reduce yield, nutritional quality, and the predictability of harvests. In addition, studies report the geographical expansion of agricultural pests and diseases, aggravating economic losses and pressuring small rural producers, particularly those dependent on subsistence agriculture (Bouabdelli *et al.*, 2022; Grigorieva, 2020).

Another aspect widely discussed refers to the economic impacts arising from the reduction in food supply. The literature demonstrates that productive fluctuations associated with extreme weather events contribute to the rise in food prices in the national and international market, compromising the purchasing power of families. This phenomenon affects socially vulnerable groups more intensely, in which a significant portion of income is

already destined for food, favouring quantitative and qualitative restriction of food consumption (Lloyd *et al.*, 2024; Springmann *et al.*, 2021).

In the Brazilian context, the studies indicate that the effects of climate change overlap with historical and structural inequalities. Regions such as the Northeastern Semi-arid, the Legal Amazon, and urban peripheries present greater susceptibility to food insecurity owing to the combination of poverty, infrastructural fragility, low coverage of public policies, and economic dependence on climate-sensitive sectors. Recent data reveal the persistence of worrying levels of moderate and severe food insecurity, reinforcing the need for intersectoral and territorialised governmental responses (Penssan, 2021; Monteiro *et al.*, 2022).

In addition to the quantitative dimension of access to food, the literature highlights significant impacts on the nutritional quality of diets. In scenarios of food inflation and reduced household income, the substitution of fresh and minimally processed foods by ultra-processed products of lower relative cost and higher energy density tends to occur. Such a process simultaneously favours micronutrient deficiencies, overweight, and an increase in the prevalence of chronic non-communicable diseases, characterising the so-called double burden of malnutrition (Fanzo *et al.*, 2022; Myers *et al.*, 2020).

The findings also demonstrate that food insecurity induced by climate events directly repercusses on public health. Interruptions in water supply, damage to logistical infrastructure, post-harvest losses, and food contamination increase population exposure to infectious diseases and nutritional disorders. Thus, food security should be understood as an essential component of health promotion and health surveillance, requiring articulation between environmental, agricultural, and assistance policies (WHO, 2023; Salvajo *et al.*, 2023).

It is important to highlight that the observed impacts are not distributed homogeneously among population groups. Children, the elderly, women in situations of vulnerability, indigenous peoples, traditional communities, and family farmers are among the segments most exposed to the food and health consequences of the climate crisis. This pattern corroborates theoretical models of the social determinants of health, according to which income, educational attainment, territory, and labour insertion condition different levels of protection or exposure to risk (Santos *et al.*, 2023).

In contrast to the identified risks, the literature points out successful experiences related to resilient agriculture and agroecology as promising strategies of climate adaptation. Practices such as crop diversification, sustainable water management, recovery of degraded soils, incentive to biodiversity, and the strengthening of family farming have shown potential to expand local productive security and reduce dependence on long supply chains. Such

initiatives contribute simultaneously to environmental sustainability, income generation, and food sovereignty (Altieri; Nicholls, 2020; FAO, 2021).

In the institutional field, the studies reinforce the relevance of public policies of social protection and food supply. Income transfer programmes, school feeding, governmental purchases from family farming, and the strengthening of the Sistema Nacional de Segurança Alimentar e Nutricional constitute effective mechanisms for mitigating the social impacts of the climate crisis. However, their effectiveness depends on administrative continuity, adequate financing, systematic monitoring, and intersectoral governance among health, agriculture, social assistance, and the environment (Brasil, 2024).

In summary, the analysed results demonstrate that climate change represents a concrete and multifaceted threat to Food and Nutrition Security. It is not exclusively an environmental problem but a systemic crisis that involves agricultural production, economic access, the quality of diets, collective health, and social justice. Confronting this scenario requires evidence-based policies, international cooperation, and a transition to sustainable, resilient, and socially inclusive food systems, in line with the Sustainable Development Goals and the global commitments to climate adaptation (ONU, 2015; FAO *et al.*, 2023; IPCC, 2023).

5 FINAL CONSIDERATIONS

The evidence analysed in this review demonstrates that climate change represents one of the main contemporary challenges for the guarantee of Food and Nutrition Security (FNS), directly impacting the availability, access, utilisation, and stability of food in different regions of the world. Extreme weather events, such as droughts, floods, heatwaves, and changes in precipitation regimes, compromise agricultural production, affect food systems, and widen social inequalities, making vulnerable populations even more susceptible to food and nutrition insecurity.

It was observed that the effects of climate change transcend the environmental dimension, configuring themselves as a complex problem that involves economic, social, and health aspects. The reduction in agricultural productivity, the loss of biodiversity, the increase in food prices, and the greater occurrence of diseases related to water, food, and transmission vectors directly impact the health of populations. In this context, food insecurity ceases to be merely a matter of production and supply, coming to be recognised as an important social determinant of health.

The analysis of the interfaces between health, environment, and society evidences the need for integrated and intersectoral approaches to confront these challenges. Adaptation

and mitigation strategies must simultaneously consider the promotion of health, environmental sustainability, the protection of natural resources, and the reduction of socioeconomic vulnerabilities. The adoption of more resilient, sustainable, and inclusive food systems becomes fundamental to ensure the food security of present and future generations.

The relevance of public policies aimed at sustainable agriculture, environmental conservation, water security, health surveillance, and social protection is also highlighted. The strengthening of climate and food governance, combined with investment in research, technological innovation, and environmental education, can contribute significantly to increasing the adaptive capacity of communities in the face of climate impacts.

From the perspective of Planetary Health, the results reinforce that human health depends directly on the preservation of ecosystems and on climate stability. Thus, confronting climate change is not only an environmental agenda but also an essential strategy for the promotion of health, the reduction of inequalities, and the guarantee of the human right to adequate food.

Finally, this study evidences the need to expand investigations on the impacts of climate change on Food and Nutrition Security, especially in contexts of greater socio-environmental vulnerability, such as the Amazon and other regions strongly dependent on natural resources. The production of robust scientific evidence may support more effective decisions and contribute to the construction of more resilient and sustainable societies, committed to the health of populations and of the planet.

ABSTRACT

Brazilian dairy agribusiness occupies a prominent global position, with an annual output exceeding 34 billion litres. However, mastitis and other mammary disorders represent severe economic obstacles, impacting productivity and animal welfare. The aim of this work is to demonstrate the applicability of ultrasonography in the morphophysiological assessment of the bovine mammary gland, establishing new precision diagnostic foundations for modern dairy farming through the integration of classical semiology and high-resolution imaging. The glandular structure, composed of four independent quarters and supported by a complex ligamentous apparatus, demands high metabolic activity for milk synthesis, a process governed by delicate endocrine control and by the neuroendocrine ejection reflex mediated by oxytocin. Systematic clinical examination, which includes anamnesis, inspection, palpation and field tests (Black-Bottomed Strip Cup and CMT), is fundamental but limited in the assessment of hidden internal lesions. In this context, ultrasonography assumes a leading role as a non-invasive and painless precision tool; the use of B-mode allows mapping of tissue echotexture to identify early fibrosis and abscesses, while Colour Doppler monitors perfusion and inflammatory haemodynamic changes before the onset of clinical symptoms, also optimising the study of obstructive teat pathologies through the water-bath immersion technique. It is concluded that technological integration in mammary diagnosis is indispensable for the sustainability of dairy farming, enabling early interventions, effective therapeutic monitoring, preservation of animal welfare and support for genetic selection of more resistant dams.

RESUMO

O agronegócio leiteiro brasileiro ocupa uma posição de destaque mundial, com uma produção superior a 34 bilhões de litros anuais. Contudo, a mastite e outras afecções mamárias representam entraves econômicos severos, impactando a produtividade e o bem-estar animal. O objetivo deste trabalho é demonstrar a aplicabilidade da ultrassonografia na avaliação morfofisiológica da glândula mamária bovina, estabelecendo novas bases diagnósticas de precisão para a pecuária leiteira moderna por meio da integração entre a semiologia clássica e a imagem de alta resolução. A estrutura glandular, composta por quatro quartos independentes e sustentada por um complexo aparato ligamentar, exige uma demanda metabólica elevada para a síntese láctea, processo regido por um delicado controle endócrino e pelo reflexo neuroendócrino de ejeção mediado pela ocitocina. O exame clínico sistemático, que inclui anamnese, inspeção, palpação e testes de campo (Caneca de Fundo Preto e CMT), é fundamental, porém limitado na avaliação de lesões internas ocultas. Nesse contexto, a ultrassonografia assume papel protagonista como ferramenta de precisão não invasiva e indolor; o uso do modo B permite mapear a ecotextura tecidual para identificar fibroses e abscessos precoces, enquanto o Doppler Colorido monitora a perfusão e as alterações hemodinâmicas inflamatórias antes do surgimento de sintomas clínicos, otimizando também o estudo de patologias obstrutivas do teto pela técnica de imersão em banho-maria. Conclui-se que a integração tecnológica no diagnóstico mamário é indispensável para a sustentabilidade da pecuária leiteira, possibilitando intervenções precoces, monitoramento terapêutico eficaz, preservação do bem-estar animal e suporte à seleção genética para matrizes mais resistentes.

RESUMEN

El agronegocio lechero brasileño ocupa una posición destacada a nivel mundial, con una producción superior a 34 mil millones de litros anuales. Sin embargo, la mastitis y otras afecciones mamarias representan obstáculos económicos severos, impactando la productividad y el bienestar animal. El objetivo de este trabajo es demostrar la aplicabilidad de la ultrasonografía en la evaluación morfofisiológica de la glándula mamaria bovina, estableciendo nuevas bases diagnósticas de precisión para la ganadería lechera moderna mediante la integración entre la semiología clásica y la imagen de alta resolución. La estructura glandular, compuesta por cuatro cuartos independientes y sostenida por un complejo aparato ligamentario, exige una demanda metabólica elevada para la síntesis láctea, proceso regido por un delicado control endocrino y por el reflejo neuroendocrino de eyección mediado por la oxitocina. El examen clínico sistemático, que incluye anamnesis, inspección, palpación y pruebas de campo (Taza de Fondo Negro y CMT), es fundamental, pero limitado en la evaluación de lesiones internas ocultas. En este contexto, la ultrasonografía asume un papel protagonista como herramienta de precisión no invasiva e indolora; el uso del modo B permite mapear la ecotextura tisular para identificar fibrosis y abscesos precoces, mientras que el Doppler Color monitorea la perfusión y las alteraciones hemodinámicas inflamatorias antes de la aparición de síntomas clínicos, optimizando también el estudio de patologías obstrutivas del pezón mediante la técnica de inmersión en baño maría. Se concluye que la integración tecnológica en el diagnóstico mamario es indispensable para la sostenibilidad de la ganadería lechera, posibilitando intervenciones precoces, monitoreo terapéutico eficaz, preservación del bienestar animal y apoyo a la selección genética de matrices más resistentes.

1 INTRODUCTION

Brazilian agribusiness plays a crucial and strategic role in the national economy, standing out significantly in the dairy sector, where the country has consolidated its position as the third largest producer in the world. National output exceeds the historic mark of 35.7 billion litres per year, driven by a cattle herd that has reached 238.2 million animals. Given this magnitude, dairy farming has consolidated itself as one of the most dynamic sectors of the national agribusiness. However, the economic sustainability of this activity is intrinsically dependent on the health of the mammary gland, since pathologies such as mastitis have historically represented the greatest productive bottleneck of the activity. The occurrence of mammary disorders results in severe impacts ranging from a drastic reduction in the volume produced to profound alterations in the centesimal composition of milk, generating high expenditure on pharmaceuticals, early culling of high genetic-value dams and impairment of animal welfare. In this scenario of technological intensification, mastery of the clinical examination and a thorough knowledge of udder morphophysiology become indispensable tools for the veterinarian who seeks to ensure the sanitary safety and competitiveness of the dairy chain (IBGE, 2025; MAPA, 2023).

Anatomically, the udder of the bovine female is defined as a highly complex exocrine structure, composed of four individual and entirely independent mammary glands, which consolidate into a single mass firmly attached to the inguinal region of the animal. These functional units are divided into anterior and posterior mammary quarters, internally separated by connective-tissue membranes that prevent direct communication between the parenchyma of each quarter. It is widely documented in the technical literature that the posterior quarters have a greater glandular development than the anterior ones, being responsible for approximately 60% of the gland's total milk production. The support of this glandular mass, which can reach considerable weights in high-production animals, depends on a robust and specialised suspensory apparatus. The median suspensory ligament, of an elastic nature, and the lateral ligaments, of a predominantly fibrous nature, form the structural basis that keeps the udder properly positioned. Failures in this support system, whether of genetic or traumatic origin, can lead to the clinical condition known as "pendulous udder". This factor has a direct correlation with resistance to pathogen entry, since teats very close to the ground are more exposed to contaminating agents in the environment, predisposing the animal to ascending infections and traumas (Leite *et al.*, 2026; Teissier *et al.*, 2019).

As basic guidelines in the cow-side routine, field tests such as the black-bottomed strip cup are fundamental for the identification of clinical mastitis, allowing the immediate visualisation of clots, blood or alterations in milk colour. Complementarily, the California

Mastitis Test (CMT) is the tool of choice for the detection of subclinical mastitis, based on the principle of gelation of leukocyte DNA present in milk when these come into contact with the specific reagent. However, although these methods indicate the presence of an inflammatory process and increased cellularity, they have inherent limitations, as they do not provide details on the extent of internal lesions in the parenchyma or hidden structural alterations in the cisterns. It is at this point that ultrasonography assumes a leading role in modern buiatrics, representing a significant advance as a precision diagnostic tool. There is an evident linear correlation between the increase in milk cellularity and the loss of ultrasonographic homogeneity, validating the use of this non-invasive, painless and radiation-free method to grade the severity of the tissue response and to map, at an early stage, wall contours, increased echogenicity and slight ductal dilations. In addition, the association of pulsed Doppler allows tracking of haemodynamic and vascular disturbances characterised by reduced mean flow velocity and elevated resistance and pulsatility indices, which correlate directly with the activation of molecular biomarkers of the innate immune response, consolidating the real-time monitoring of tissue architecture and perfusion (Abdel-Hamied *et al.*, 2026; Estevam *et al.*, 2025; Fasulkov, 2012; Flöck; Winter, 2006; Leite *et al.*, 2026; Maddison *et al.*, 2023).

The physiology of lactation and the process of milk ejection are governed by a complex and delicate endocrine control that begins as early as the foetal phase and intensifies during the phases of puberty and gestation. Steroid hormones, such as oestrogen and progesterone, act in the development of the duct system and of the secretory parenchyma, respectively. During the lactation period itself, prolactin and somatotropin maintain the metabolic activity of the epithelial cells, while the mechanical process of milk ejection depends on an immediate neuroendocrine reflex. Tactile stimulation of the udder, provoked either by the calf's suckling or by correct pre-milking hygiene, sends afferent signals to the hypothalamus, promoting the rapid release of oxytocin by the neurohypophysis. Oxytocin, upon reaching the mammary gland via the bloodstream, causes the contraction of the myoepithelial cells that surround the alveoli, forcing the milk out into the large ducts. Interruptions in this physiological process, caused by stress, fear or pain, provoke the release of adrenaline. This hormone promotes vasoconstriction and blocks the oxytocin receptors, resulting in severe milk retention and direct damage to milking management and to gland health. This prolonged retention raises the intramammary hydrostatic pressure, which can initiate an early aseptic inflammatory process and weaken the epithelial cellular barriers even before bacterial invasion (Akers, 2016; Maddison *et al.*, 2023; Reece, 2017).

For the maintenance of mammary health, the clinical examination plan must be carried out in a systematic and rigorous manner to avoid diagnostic failures. The protocol is grounded in classical semiology, beginning with a detailed anamnesis, seeking information on the reproductive history, somatic cell count (SCC) of the herd and previous occurrences of clinical mastitis. The physical restraint of the animal is a critical step and must be carried out in a way that ensures the safety of the examiner without causing excessive discomfort to the animal, using restraint chutes or hobbles. Visual inspection at a distance allows assessment of the symmetry of the quarters, the presence of oedemas, abscesses, fistulae or cutaneous lesions on the teats. The subsequent manual palpation is essential to detect alterations in local temperature (hyperthermia in acute cases), painful sensitivity and consistency of the parenchyma. In healthy animals, the glandular tissue should be soft and elastic on palpation; the presence of firm, hardened areas or with nodulations indicates fibrosis processes resulting from chronic or cicatricial inflammations (Dirksen; Gründer; Stöber, 2005; Feitosa, 2014; 2020; Jackson; Cockcroft, 2014).

The relevance of diagnostic imaging takes on fundamental contours when one considers the need for early interventions before irreversible damage occurs to the secretory parenchyma. Although tests based on cellular or biochemical inflammatory biomarkers, such as the CMT and the SCC, are sensitive in pointing out the inflammatory state, they fail to map the internal morphology of the affected organ and cannot detail the degree of hidden structural impairment of the parenchyma. Ultrasonography mitigates this gap by acting directly in the identification of microscopic and macroscopic structural alterations in real time, serving as a refined technique of screening and monitoring on the farm. It is a substantially less invasive and stressful approach for the animal when compared with tissue biopsies or repeated probings of ducts, which frequently cause physical traumas and predispose to the ascension of external pathogens. Being a painless method, ultrasonography acts in accordance with the modern precepts of welfare in dairy production, avoiding acute stress neuroendocrine responses and preserving the physiological homeostasis necessary to maintain lactation productivity (Maddison *et al.*, 2023; Venkatesan *et al.*, 2020).

The application of ultrasonographic technology to the mammary gland uses transducers that emit sound waves at varied frequencies, and the correct choice of equipment is what guarantees the effectiveness of the examination. Low-frequency transducers, such as convex ones of 3.5 to 5 MHz, offer greater penetration of the sound waves, being ideal for scanning the deep glandular parenchyma and visualising the gland cistern. On the other hand, high-frequency linear transducers (7.5 to 10 MHz) provide superior image resolution for superficial structures, being indispensable for the detailed study of the teat, the papillary

canal and the cistern wall. Through the direct-contact technique, the transducer is applied with acoustic gel over the skin of the udder, allowing observation of the echogenicity of the parenchyma. Healthy mammary tissue presents ultrasonographically as a fine and homogeneous granular structure, with the presence of anechoic (black) blood vessels and ducts. Pathological alterations, such as abscesses, are visualised as cavitary structures with content of variable echogenicity, while fibrosis manifests as hyperechoic (white) areas that distort the normal architecture of the organ. In this sense, diagnostic ultrasonography acts as a determining tool to discriminate with precision the severity of these chronic structural parenchymal alterations from acute reversible inflammatory processes, optimising clinical decision-making at the animal's side. In addition, the use of the Doppler tool allows the monitoring of blood flow in real time, assisting in the differentiation between acute inflammatory processes and neoplasias. Doppler mapping quantifies the vascular resistance indices, allowing the clinician to discern areas with active inflammation amenable to therapeutic intervention from those already taken over by irreversible fibrosis, which guides a realistic economic prognosis for the producer (Estevam *et al.*, 2025; Fasulkov, 2012; Flöck; Winter, 2006; Leite *et al.*, 2026; Maddison *et al.*, 2023; Seibt *et al.*, 2023).

The detailing of the vascular architecture by means of Doppler adds an unprecedented layer of precision to the early diagnosis of mastitis, since the tissue perfusion of the udder undergoes measurable alterations immediately after bacterial infection, even before the establishment of severe parenchymal damage. The monitoring of blood flow in the main supply routes of the gland, such as the milk vein and the pudendoepigastric trunk, allows the non-invasive measurement of haemodynamic parameters such as maximum flow velocity and the vascular resistance index. The significant increase in circulating blood volume correlates directly with the recruitment of inflammatory cells in mammary quarters under subclinical infectious stress, allowing the veterinarian to identify haemodynamic alterations early and to act with supportive therapies or preventive management adjustments before the loss of functional secretory tissue (Braun *et al.*, 2017; Maddison *et al.*, 2023).

For a thorough assessment of the anatomy of the teat, where many obstructive pathologies originate, the "water-bath" or immersion technique is widely recommended by specialists. In this modality, the teat is submerged in a container, such as a plastic cup or disposable glove, containing warm water or physiological solution, and the transducer is positioned externally to the container. The water acts as an excellent acoustic coupling medium, eliminating artefacts caused by direct contact and avoiding the compression of the sensitive structures of the teat by the operator's hand. This technique provides a perfect acoustic window for precise biometric measurements, such as the length of the teat canal,

the width of the papillary cistern and the thickness of the mucosal wall. Such measurements are crucial to identify stenoses, internal papillomas or other pathologies that interfere directly with milk drainage, as observed in follow-up studies of affected mammary quarters. In addition, studies indicate that teats with shorter canals or wider sphincters may present greater predisposition to the entry of microorganisms, making ultrasonography a predictive tool for the selection of animals more resistant to infections (Franz *et al.*, 2009; Leite *et al.*, 2026; Tóth *et al.*, 2023).

The application of high-resolution ultrasonography at the papillary extremity also serves as a direct indicator of the localised mechanical stress exerted by the milking machinery. Physical alterations in the thickness of the teat wall and the focal loss of the anechoic zones of the papillary cistern occur due to the development of oedemas induced by failures in the vacuum level or in the pulsation rate of the equipment. The early detection of these hidden structural alterations in the mucosa, which precede the macroscopic lesions and the external cracks in the teat skin, prevents mechanical stress from evolving into severe conditions of clinical mastitis, transforming field ultrasonography into an indispensable tool to audit milking management and to safeguard the productive health of the herd (Gleeson *et al.*, 2004; Maddison *et al.*, 2023).

The rigorous integration of the traditional semiological methods with high-resolution ultrasonographic technology represents the state of the art in the sanitary management of contemporary dairy herds. The capacity to differentiate physiological processes, such as parturition oedemas, from serious infectious processes and to monitor tissue recovery after antibiotic treatments confers upon the veterinarian an unprecedented diagnostic and prognostic assertiveness. The holistic understanding of mammary health, provided by the real-time visualisation of internal structures, raises the standard of monitoring in the field and allows early interventions, especially at subclinical stages. Beyond the immediate clinical aspect, the use of imaging as support for genetic selection allows producers to seek animals with udder and teat conformation that favour productive longevity and milking ease. The continuous investment in technical training for the use of these diagnostic tools therefore proves indispensable to guarantee economic sustainability, food safety and animal welfare, ensuring that early diagnosis is the central pillar of ruminant production in the contemporary global market (Hoque *et al.*, 2024; Leite *et al.*, 2026; Santos *et al.*, 2022).

ABSTRACT

Considering the increasing incorporation of artificial intelligence into health services and the risks of reproducing inequalities through algorithmic systems, this article analyses the impacts of these technologies on patients in vulnerable situations. It aims to discuss how the use of artificial intelligence in health care may affect the fundamental right to health, health care equity and the legal protection of patients, especially in view of the possibility of algorithmic discrimination. To this end, a qualitative, bibliographic and documentary study is carried out, guided by a legal-critical analysis, based on Brazilian legislation, international documents and scientific studies on artificial intelligence, vulnerability, data protection and fundamental rights. In this way, it is observed that algorithmic systems, when developed from incomplete, biased or poorly representative databases, may reproduce social, racial, economic and territorial inequalities already present in health systems. It is also verified that algorithmic opacity hinders transparency, the contestation of decisions and accountability for possible damages. It is concluded that artificial intelligence will only contribute to the realisation of the right to health if it is subject to governance mechanisms, human supervision, auditing, protection of sensitive data and institutional accountability.

RESUMO

Considerando a crescente incorporação da inteligência artificial nos serviços de saúde e os riscos de reprodução de desigualdades por meio de sistemas algorítmicos, este artigo analisa os impactos dessas tecnologias sobre pacientes em situação de vulnerabilidade. Objetiva-se discutir de que maneira a utilização da inteligência artificial na assistência à saúde pode afetar o direito fundamental à saúde, a equidade assistencial e a proteção jurídica dos pacientes, especialmente diante da possibilidade de discriminação algorítmica. Para tanto, procede-se a uma pesquisa qualitativa, de natureza bibliográfica e documental, orientada por análise jurídico-crítica, com base em legislação brasileira, documentos internacionais e estudos científicos sobre inteligência artificial, vulnerabilidade, proteção de dados e direitos fundamentais. Desse modo, observa-se que sistemas algorítmicos, quando desenvolvidos a partir de bases de dados incompletas, enviesadas ou pouco representativas, podem reproduzir desigualdades sociais, raciais, econômicas e territoriais já existentes nos sistemas de saúde. Também se verifica que a opacidade algorítmica dificulta a transparência, a contestação de decisões e a responsabilização por eventuais danos. Conclui-se que a inteligência artificial somente poderá contribuir para a efetivação do direito à saúde se for submetida a mecanismos de governança, supervisão humana, auditoria, proteção de dados sensíveis e responsabilização institucional.

RESUMEN

Considerando la creciente incorporación de la inteligencia artificial en los servicios de salud y los riesgos de reproducción de desigualdades por medio de sistemas algorítmicos, este artículo analiza los impactos de estas tecnologías sobre pacientes en situación de vulnerabilidad. Tiene como finalidad discutir de qué manera el uso de la inteligencia artificial en la atención sanitaria puede afectar el derecho fundamental a la salud, la equidad asistencial y la protección jurídica de los pacientes, especialmente ante la posibilidad de discriminación algorítmica. Para ello, se realiza una investigación cualitativa, de carácter bibliográfico y documental, orientada por un análisis jurídico-crítico, con base en la legislación brasileña, documentos internacionales y estudios científicos sobre inteligencia artificial, vulnerabilidad, protección de datos y derechos fundamentales. De esta manera, se observa que los sistemas algorítmicos, cuando se desarrollan a partir de bases de datos incompletas, sesgadas o poco representativas, pueden reproducir desigualdades sociales, raciales, económicas y territoriales ya existentes en los sistemas de salud. También se verifica que la opacidad algorítmica dificulta la transparencia, la impugnación de decisiones y la responsabilización por eventuales daños. Se concluye que la inteligencia artificial solo podrá contribuir a la efectividad del derecho a la salud si se somete a mecanismos de gobernanza, supervisión humana, auditoría, protección de datos sensibles y responsabilidad institucional.

1 INTRODUCTION

Artificial intelligence has been occupying an increasing role in contemporary health systems, influencing diagnostic processes, clinical monitoring, triage, therapeutic planning and the management of services. The advancement of digital technologies, combined with the expanded capacity to process large volumes of data, has enabled the incorporation of algorithmic systems at different stages of care. These tools are frequently presented as instruments capable of increasing diagnostic accuracy, optimising institutional resources and favouring faster clinical decisions. However, their expansion also produces new ethical and legal challenges, especially when their effects fall upon individuals and groups historically rendered vulnerable.

Vulnerability, in the field of health, cannot be understood merely as an individual or biological condition. It is a category traversed by social, economic, racial, territorial, age-related and institutional factors, which directly influence the forms of illness, access to services and the care outcomes achieved by the population. In this sense, the incorporation of artificial intelligence into health services does not occur in a neutral space, since technological systems come to operate in realities already marked by inequalities. The World Health Organization recognises that artificial intelligence has the potential to strengthen health systems, but warns that its use must observe principles of transparency, responsibility, inclusion, equity and the protection of human rights (World Health Organization, 2021).

In Brazil, this discussion assumes even greater relevance in view of the structural inequalities that have historically limited access to health. The Constituição Federal de 1988 recognises health as a right of all and a duty of the State, ensuring universal and equal access to the actions and services aimed at its promotion, protection and recovery (Brasil, 1988). This constitutional mandate underpins the Sistema Único de Saúde and imposes upon the State the duty to develop public policies guided by universality, comprehensiveness and equity. Despite this, barriers persist that disproportionately affect certain population segments, such as black people, the elderly, persons with disabilities, rural populations, traditional peoples and individuals in situations of socio-economic vulnerability.

The incorporation of artificial intelligence systems into this scenario broadens the complexity of the debate. Although such technologies may assist professionals and managers in decision-making, they may also reproduce patterns of exclusion when developed from incomplete, unequal or poorly representative databases. Algorithmic discrimination occurs when automated systems produce outcomes that disadvantage certain groups, even when there is no direct discriminatory intent. Thus, algorithms should not be

understood as purely technical instruments, since the data used for their training may carry historical, social and institutional marks of inequality.

Obermeyer *et al.* (2019), in analysing an algorithm used in the North American health system to identify patients who should receive additional care, demonstrated the presence of significant racial bias. The study found that black patients, when classified with the same risk score as white patients, presented more severe clinical conditions, which indicated the underestimation of their health needs. The problem arose, to a large extent, from the use of care costs as proxies for clinical needs, disregarding the fact that racialised groups, owing to historical inequalities of access, may generate lower health expenditure without this representing a lesser need for care.

Concern with these effects also appears in international documents aimed at the ethical governance of artificial intelligence. The Recommendation on the Ethics of Artificial Intelligence by UNESCO establishes that the development and use of algorithmic systems must be guided by the protection of human dignity, human rights, diversity, social justice and non-discrimination. The document also highlights the importance of transparency, human supervision and accountability, especially when automated decisions may affect people's rights, safety or living conditions (Unesco, 2021).

In the field of health, these concerns become even more sensitive because decisions supported by artificial intelligence may influence diagnoses, referrals, care priorities, treatment recommendations and access to specialised programmes. When the functioning of these systems is not comprehensible to professionals, patients and institutions, the problem of algorithmic opacity arises, frequently described as a “black box”. This opacity hinders the identification of errors, the contestation of decisions and the attribution of responsibility in the event of damages. For Floridi *et al.* (2018), a socially appropriate artificial intelligence must be guided by principles such as beneficence, non-maleficence, autonomy, justice and explicability, so that its use does not remove human and institutional responsibility.

The legal protection of patients also requires attention to the processing of sensitive personal data. The Lei Geral de Proteção de Dados Pessoais, Lei nº 13.709/2018, establishes rules for the processing of personal data in physical and digital media, with the aim of protecting the fundamental rights of freedom, privacy and the free development of personality. Within the same legal instrument, data relating to health are recognised as sensitive personal data, requiring greater caution regarding their collection, storage, sharing and use by public and private institutions (Brasil, 2018).

Nevertheless, data protection, although indispensable, does not exhaust the legal challenges posed by artificial intelligence in health. The use of algorithmic systems also

involves questions related to equality, care equity, patient autonomy, informed consent, the transparency of clinical decisions and accountability for possible damages. In contexts of vulnerability, these problems become more serious, since patients with less access to information, less power of institutional contestation or belonging to historically discriminated groups may be more affected by unjust or insufficiently transparent automated decisions.

The relevance of this study arises from the need to understand the legal and social impacts of artificial intelligence upon vulnerable patients in a context of increasing digitalisation of health care. Although studies on artificial intelligence have expanded in recent years, it is still necessary to deepen the analysis of its relationship with the fundamental right to health, algorithmic discrimination and the legal protection of patients, especially from the Brazilian reality, marked by persistent social inequalities.

In view of this scenario, the present article seeks to answer the following research question: in what way can the use of artificial intelligence systems in health care impact the legal protection of vulnerable patients, especially with regard to the right to health, care equity and the risks of algorithmic discrimination?

The general objective of this study is to analyse the impacts of the use of artificial intelligence in health care upon vulnerable patients, discussing the risks of algorithmic discrimination and the challenges related to the legal protection of these individuals. Specifically, it intends to examine the relationship between vulnerability and the right to health; to identify the main risks associated with algorithmic biases in medical care; and to discuss the legal mechanisms aimed at the protection of patients in view of the increasing incorporation of intelligent systems into health services.

2 THEORETICAL BACKGROUND

The theoretical framework of this study is organised around four central axes: the understanding of health as a fundamental right; the notion of vulnerability in the health field; the incorporation of artificial intelligence into health services; and the risks of algorithmic discrimination in view of the legal protection of patients. This articulation is necessary because artificial intelligence, although frequently presented as a technical instrument for the improvement of care, operates within social systems marked by historical, institutional and territorial inequalities.

2.1 RIGHT TO HEALTH, VULNERABILITY AND CARE INEQUALITIES

The right to health, in the Brazilian legal order, has a fundamental nature and finds direct grounding in the dignity of the human person, in material equality and in social

protection. The Constituição Federal de 1988 established that health is a right of all and a duty of the State, to be guaranteed through social and economic policies aimed at reducing the risk of disease and at universal and equal access to actions and services of promotion, protection and recovery (Brasil, 1988). This constitutional recognition represented a break with restrictive models of care, in which access to health services depended on formal linkage to employment or on the economic capacity of the individual.

The creation of the Sistema Único de Saúde consolidated this change by establishing a public policy guided by the principles of universality, comprehensiveness and equity. The Lei nº 8.080/1990 broadened the legal and social understanding of health by recognising that its levels are determined by factors such as food, housing, basic sanitation, the environment, work, income, education, transport, leisure and access to essential goods and services (Brasil, 1990). In this way, health cannot be reduced to medical or hospital care, since it involves concrete conditions of existence that directly influence the forms of illness, care and survival of the population.

In this scenario, vulnerability assumes a central role in understanding care inequalities. In the health field, it should not be understood merely as individual, biological or clinical fragility, but as a result of social processes that render certain individuals more exposed to illness and less protected by institutions. Black people, the elderly, persons with disabilities, rural populations, traditional peoples, women, children and individuals in situations of poverty face more intense barriers to accessing services, obtaining timely diagnosis, understanding health information and receiving adequate treatment.

Ayres *et al.* (2003) understand vulnerability from three articulated dimensions: individual, social and programmatic. The individual dimension refers to the conditions of information, risk perception and the concrete possibility of action of individuals. The social dimension involves economic, racial, territorial, cultural, educational and gender inequalities. The programmatic dimension, in turn, relates to the capacity of public policies, services and institutions to respond to the needs of the population. This formulation is important because it shifts the analysis of vulnerability from the individual to the set of social and institutional relations that produce a lack of protection.

Vulnerability, therefore, lies not only in the patient, but also in the way the health system organises its responses. An individual may be considered rendered vulnerable not because of a natural condition, but because they encounter material, informational, territorial and institutional barriers that hinder the exercise of their rights. This perspective prevents responsibility for the lack of access to care from being attributed exclusively to the individual,

since it demonstrates that health inequalities arise from social structures that distribute opportunities for protection, diagnosis and treatment unequally.

Recent studies on access to health in Brazil demonstrate that racial and income inequalities remain structuring elements of the population's health experience. Tomasiello *et al.* (2023) point out that the spatial distribution of health services reveals important inequalities, especially when the relationships between race, income and access to care facilities are observed. In areas with a higher proportion of black population and lower income, access conditions tend to be more limited, revealing that physical distance, transport, income and the territorial organisation of services interfere directly with the realisation of the right to health.

The racial question also occupies a relevant place in this debate. The Ministério da Saúde has recognised that racial and social inequalities negatively impact the health of the black population, resulting in higher morbidity and mortality and greater difficulties in accessing services (Brasil, 2025). This recognition reinforces that racism must be understood as a social determinant of health, since it affects living conditions, the treatment received in institutions, the production of epidemiological data and the formulation of public policies. Thus, equity in the SUS requires not only the formal provision of services, but the adoption of specific strategies to confront historically produced inequalities.

The discussion on vulnerability also becomes more complex in view of the digitalisation of health services. The expansion of digital platforms, electronic medical records, teleconsultation, automated triage systems and tools based on artificial intelligence may bring important gains for management and care. However, these technologies are incorporated into a society marked by inequalities in access to the internet, to information, to schooling, to income and to health services themselves. Therefore, technological innovation cannot be presumed to be universally beneficial, since its effects depend on the concrete conditions of access and use by different social groups.

Dankwa-Mullan (2024) warns that the use of artificial intelligence in public health and medicine must be accompanied by ethical reflection aimed at equity, since algorithmic systems may reproduce or amplify inequalities when trained with incomplete, biased or poorly representative data. This concern is especially relevant in unequal countries, in which certain groups appear insufficiently in databases or are historically underdiagnosed and undertreated. In these cases, artificial intelligence may transform prior inequalities into automated criteria for decision-making.

The Organisation for Economic Co-operation and Development also highlights that artificial intelligence presents great potential to improve health outcomes, but involves

significant risks when used without adequate governance, especially in relation to biases, data quality, security, transparency and institutional accountability (OECD, 2024). In the same sense, the World Health Organization has argued that the use of algorithmic technologies in health must observe principles of equity, inclusion, human supervision and the protection of fundamental rights, especially when applied to groups in situations of vulnerability (World Health Organization, 2025).

The incorporation of artificial intelligence into health services must be analysed from this reality. When digital systems are implemented in contexts marked by care inequalities, there is the risk that the technology may not only reproduce these asymmetries, but also render them less visible and more difficult to contest. An algorithm may classify risks, indicate priorities or guide referrals with the appearance of neutrality, but its results depend on the data used, on the criteria defined and on the social conditions that structure the health system itself.

Thus, the promise of technological innovation must be confronted with the legal protection of vulnerable patients. The right to health requires that artificial intelligence be used as an instrument for the expansion of care, and not as a mechanism of exclusion, invisibilisation or indirect discrimination. Equity, in this context, must guide both the formulation of public policies and the development, validation, auditing and use of algorithmic systems in care. Without this concern, technology runs the risk of reinforcing historical inequalities under the appearance of technical efficiency.

2.2 ARTIFICIAL INTELLIGENCE APPLIED TO HEALTH

Artificial intelligence may be understood as a set of computational techniques aimed at performing tasks that, traditionally, would require some degree of human intelligence, such as pattern recognition, information classification, risk prediction and decision support. In the area of health, these technologies have been used in imaging examinations, patient triage, analysis of medical records, prediction of clinical deterioration, hospital management, drug development and the remote monitoring of chronic conditions.

The World Health Organization recognises that artificial intelligence may contribute to the strengthening of health systems, especially by broadening the capacity for data analysis, supporting clinical decisions and favouring prevention strategies. However, the same document warns that its use must be guided by ethical principles, human rights, transparency, responsibility, inclusion and equity, since poorly designed systems may compromise patient safety and deepen already existing inequalities (World Health Organization, 2021).

In the health field, artificial intelligence does not act in isolation. It depends on databases, programming criteria, institutional choices and validation models. Therefore, its apparent neutrality needs to be problematised. Algorithms are constructed from data produced in concrete social contexts. If these data reflect historical inequalities in access to health, underreporting, late diagnoses or a lesser presence of certain groups in services, the system may reproduce these distortions in its recommendations.

Floridi *et al.* (2018) argue that artificial intelligence must be guided by principles such as beneficence, non-maleficence, autonomy, justice and explicability. These principles are especially relevant in health, since automated decisions may directly affect the life, treatment, autonomy and safety of patients. In this way, the use of intelligent systems cannot remove human, medical and institutional responsibility, under penalty of transforming the technology into an opaque and scarcely contestable decision-making instance.

The discussion becomes even more sensitive when one observes that, in many cases, health professionals and patients themselves do not fully understand the criteria used by algorithmic systems. This problem is known as algorithmic opacity or the “black box”, an expression used to indicate situations in which the internal functioning of the system is not transparent or intelligible. In the area of health, this opacity hinders the contestation of decisions, the identification of errors and accountability for damages.

2.3 ALGORITHMIC DISCRIMINATION AND THE REPRODUCTION OF INEQUALITIES

Algorithmic discrimination occurs when automated systems produce outcomes that disadvantage certain social groups, even when there is no explicit discriminatory intent on the part of the developers or users of the technology. This phenomenon may arise from incomplete databases, inadequate classification criteria, apparently neutral variables that function as indirect markers of race, gender, income or territory, in addition to the absence of effective auditing and human supervision.

The study by Obermeyer *et al.* (2019) became one of the main references on the subject by demonstrating the existence of racial bias in an algorithm used in the North American health system. The research identified that black patients, even presenting greater clinical severity, were classified by the system as having a lesser need for specialised care when compared to white patients with the same risk score. The problem was related to the use of care cost as an indicator of medical need, disregarding the fact that historically discriminated populations tend to access fewer services and, consequently, to generate lower health expenditure.

This example reveals that algorithmic discrimination arises not only from technical failures, but from methodological choices that may reproduce social inequalities. By using costs, frequency of care or history of service use as indicators of clinical need, the algorithm may transform inequalities of access into apparently objective criteria. Thereby, individuals who have already been historically excluded from health services may continue to be underestimated by automated systems.

The Recommendation on the Ethics of Artificial Intelligence by UNESCO highlights that algorithmic systems must be developed and used with respect for human dignity, human rights, diversity, social justice and non-discrimination. The document also emphasises the importance of human supervision, transparency and accountability, especially when these technologies are applied in sensitive areas, such as health, security, education and access to fundamental rights (Unesco, 2021).

In the case of vulnerable patients, the risks are amplified. Depending on the way the systems are constructed, poor, black, elderly people, persons with disabilities or residents of territories with low care coverage may be inadequately classified. This may affect diagnoses, referrals, prioritisation in queues, access to treatments and inclusion in monitoring programmes. Thus, algorithmic discrimination comes to constitute not only a technological problem, but also a legal, ethical and political one.

2.4 LEGAL PROTECTION OF PATIENTS IN VIEW OF ARTIFICIAL INTELLIGENCE

The legal protection of patients in view of artificial intelligence must be understood from a set of fundamental rights. The first of these is the right to health itself, which requires universal, equal and safe access to services. The right to equality, to non-discrimination, to privacy, to the protection of personal data, to adequate information, to free and informed consent and to reparation for damages eventually suffered also stand out.

The Lei Geral de Proteção de Dados Pessoais establishes that data relating to health are sensitive personal data, requiring greater rigour in their processing. This provision is relevant because artificial intelligence systems depend on large volumes of data for training, validation and operation. However, the collection and use of this information cannot occur without limits, since it involves intimate aspects of the patients' lives and may generate discrimination when used inadequately (Brasil, 2018).

Data protection, however, is not sufficient to confront all the risks of artificial intelligence in health. Algorithmic discrimination may occur even when data are processed in a formally regular manner. Therefore, the legal protection of patients must also involve mechanisms of transparency, auditing, explicability, human supervision, impact assessment and institutional

accountability. Technology needs to be controlled by legal and ethical parameters capable of preventing automated decisions from uncritically replacing human analysis and the duty of care.

Another relevant point concerns patient autonomy. In a context of increasing use of intelligent systems, the patient must have the right to be informed about the use of algorithmic technologies in decisions that may affect their diagnosis, treatment or access to services. The absence of adequate information weakens consent and hinders the exercise of contestation. In situations of vulnerability, this informational asymmetry may be even more serious, since certain patients have less institutional capacity to question technical decisions or to demand a review of procedures.

In this way, the legal protection of patients requires an integrated approach. It is not enough to recognise the potential of artificial intelligence to improve health care. It is necessary to establish limits, duties and responsibilities so that its use does not compromise fundamental rights. Technology must be an instrument for the expansion of care, and not a mechanism for the silent reproduction of inequalities. The contemporary legal challenge lies precisely in constructing forms of governance that allow innovation without removing the centrality of the human person, equity and social justice.

3 METHODOLOGY

The study was developed from a qualitative approach, with a bibliographic and documentary survey, guided by a legal-critical analysis. The choice of this path arises from the very nature of the investigated object, since the impacts of artificial intelligence in health cannot be understood merely as a technical phenomenon, but as a social, ethical and legal question, especially when its effects fall upon patients in situations of vulnerability.

The analysis was constructed from academic works, scientific articles, Brazilian legislation and national and international institutional documents related to the right to health, vulnerability, artificial intelligence, algorithmic discrimination, the protection of personal data and legal responsibility. In particular, the Constituição Federal de 1988, the Lei nº 8.080/1990, the Lei Geral de Proteção de Dados Pessoais, Lei nº 13.709/2018, as well as documents produced by bodies such as the World Health Organization and UNESCO, were considered.

The qualitative approach allows the problem to be examined in its complexity, considering the social and institutional meanings that traverse the incorporation of digital technologies into health services. According to Minayo (2014), this type of investigation is appropriate when one intends to understand phenomena that involve social relations, values, institutional practices and processes that cannot be reduced to numerical measurement. In

this sense, the study does not seek to quantify the impacts of artificial intelligence, but to understand how algorithmic systems may interfere with the realisation of the right to health and with the legal protection of vulnerable patients.

The bibliographic survey made it possible to construct the theoretical framework and to identify the main debates on the subject. Scientific publications discussing artificial intelligence in health, algorithmic biases, care equity, vulnerability, bioethics and technological governance were prioritised. According to Gil (2002), this procedure makes it possible to gather contributions already produced on a given problem, offering a basis for critical analysis and for delimiting the categories used in the study.

The documentary analysis, in turn, was employed to examine legal norms and institutional documents that guide the protection of patients in view of the use of digital technologies. This procedure made it possible to relate the Brazilian normative framework with international recommendations on the ethics and governance of artificial intelligence, especially with regard to transparency, human supervision, non-discrimination and accountability for damages.

To organise the interpretation of the selected material, three analytical axes were defined: a) right to health, vulnerability and care inequalities; b) artificial intelligence applied to health and ethical risks; c) algorithmic discrimination and the legal protection of patients.

From these axes, the aim was to understand how the use of intelligent systems may affect access, the quality of care, the autonomy and the safety of patients. The analysis considered that algorithms are developed and applied in concrete social contexts, often marked by racial, economic, territorial and institutional inequalities. Therefore, the technology was examined not as a neutral instrument, but as a practice embedded in social and legal relations that may produce or reinforce asymmetries.

As for the criteria for selecting the sources, materials with identified authorship, recognised scientific or institutional publication and direct pertinence to the object of the study were used. Texts without an academic basis, opinion publications without grounding, materials without identification of authorship and sources of an encyclopaedic character were excluded. Recent literature was also prioritised whenever possible, owing to the rapid transformation of artificial intelligence technologies and the regulatory debates on the subject.

As it did not involve interviews, questionnaires, field observation or the collection of personal data, there was no need for submission to the Comitê de Ética em Pesquisa. Even so, care related to academic integrity, the adequate indication of the sources consulted and respect for the intellectual authorship of the works used was observed.

As a limitation, it is recognised that the study does not empirically examine a specific artificial intelligence system used in health services in Brazil. The analysis concentrates on the theoretical, normative and critical discussion of the problem, offering a basis for future investigations that may assess concrete cases, institutional practices or direct impacts upon groups rendered vulnerable.

In this way, the adopted methodological path makes it possible to analyse artificial intelligence applied to health from its relationship with the fundamental right to health, vulnerability, care equity and the legal mechanisms necessary for the protection of patients in view of the risks of algorithmic discrimination.

4 RESULTS AND DISCUSSION

The analysis carried out demonstrates that artificial intelligence applied to health cannot be understood merely as a technical instrument for the modernisation of services. Although these systems are frequently presented as tools capable of increasing diagnostic accuracy, reducing human failures, optimising resources and supporting clinical decisions, their incorporation occurs in health systems previously marked by social, racial, economic, territorial and institutional inequalities. Therefore, the effects produced by artificial intelligence depend not only on its technological capacity, but also on the databases used, on the development criteria, on the validation mechanisms, on human supervision and on the existence of legal responsibility in the event of damages.

Recent studies point out that artificial intelligence may contribute to patient safety when used appropriately, especially in the detection of clinical anomalies, in diagnostic support, in the prevention of adverse events and in the organisation of care flows. De Micco *et al.* (2025) observe that these technologies may strengthen clinical risk management practices, but emphasise that their integration into health services requires attention to reproducibility, to validation in real environments and to the risks arising from their inadequate use. This finding is relevant because it demonstrates that technological innovation, by itself, does not guarantee improved care. For artificial intelligence to be legally compatible with the right to health, it must be safe, validated, transparent and subject to permanent institutional control.

In the Brazilian legal field, this discussion must be interpreted in the light of the Constituição Federal de 1988, which ensures health as a right of all and a duty of the State, through universal and equal access to the actions and services aimed at promotion, protection and recovery. This means that the adoption of intelligent technologies in health services cannot be guided merely by criteria of administrative efficiency or cost reduction.

Artificial intelligence must contribute to the realisation of the fundamental right to health and not to the creation of new forms of exclusion, especially when applied to vulnerable patients.

The recent literature shows that one of the main risks lies in the reproduction of inequalities through apparently neutral systems. Cross, Choma and Onofrey (2024) indicate that biases in medical artificial intelligence may arise at different phases of the technological process, including the choice of databases, the definition of variables, the training of models, validation and clinical implementation. When certain population groups appear insufficiently in the data used, the performance of the system may be inferior for these individuals, affecting diagnoses, risk predictions and therapeutic recommendations. Thus, algorithmic discrimination does not necessarily depend on discriminatory intent, since it may arise from technical decisions that, although apparently objective, produce unequal effects.

This point is especially important for the Brazilian context. The Sistema Único de Saúde was built upon the principles of universality, comprehensiveness and equity, but operates in a reality traversed by persistent inequalities. Black people, the elderly, persons with disabilities, rural populations, traditional peoples and individuals in situations of poverty may be more harmed by systems trained with incomplete or poorly representative data. When an algorithm is fed by records that reflect underreporting, less access to examinations, late diagnoses or low presence of certain groups in services, it may transform historical inequalities into automated criteria for decision-making.

Algorithmic discrimination, in this sense, assumes legal relevance because it directly affects the principle of material equality. It is not enough for the technology to produce good average results if its performance is inferior for groups rendered vulnerable. The legal assessment of artificial intelligence in health must consider the distribution of its benefits and risks. A system that improves general indicators, but reduces the quality of care for certain groups, does not adequately meet the constitutional duty of universal and equal access. Equity requires that technological innovation also be assessed by its capacity to reduce inequalities, and not merely by its overall efficiency.

The analysis of recent studies also reveals that algorithmic opacity remains a relevant obstacle to the protection of patients. Pham *et al.* (2025) highlight that the use of artificial intelligence in clinical decisions involves challenges related to autonomy, beneficence, non-maleficence, justice, transparency and accountability. These principles have a strong legal dimension, since decisions supported by algorithms may interfere with the life, the body, the privacy, the treatment and the continuity of care of patients. When the criteria used by the system are not comprehensible, it becomes more difficult to identify errors, contest decisions and attribute responsibility for damages.

The so-called “algorithmic black box” produces especially serious effects in the field of health. In a care relationship, the patient already finds themselves in a position of technical and informational vulnerability before professionals and institutions. When an automated system whose criteria are not explained is added to this relationship, the asymmetry becomes even greater. The patient may not know that a decision was influenced by artificial intelligence, may not understand the reasons for the recommendation and may have no concrete means to request a review. This situation compromises the right to information, weakens free and informed consent and hinders protection against discriminatory decisions.

The discussion on transparency should not be reduced to the complete opening of the source code or to the exposure of technical details inaccessible to the patient. In the legal field, explicability needs to be understood as the possibility of presenting comprehensible, sufficient and auditable reasons for decisions that affect rights. Thus, hospitals, clinics, operators, professionals and developers must be able to inform the purpose of the system, the data used, the limits of the tool, the known risks and the mechanisms available for human review. Without these elements, artificial intelligence may become an opaque decision-making instance, weakening patient autonomy and hindering accountability.

The need for human supervision appears recurrently in the analysed studies. Weiner *et al.* (2025) affirm that the integration of artificial intelligence into clinical practice requires strategies capable of confronting problems of justice, transparency, consent, confidentiality, accountability and patient-centred care. The authors highlight that systems developed with poorly representative bases or with opaque modelling processes may weaken trust in care and compromise equity. This finding reinforces that human supervision cannot be merely formal. It needs to be qualified, continuous and accompanied by institutional conditions so that professionals may question automated recommendations.

In the sphere of civil and institutional liability, artificial intelligence introduces relevant challenges. When damage arises from a decision supported by an algorithmic system, it is necessary to understand the participation of different agents: the professional who used the tool, the institution that incorporated it, the supplier who marketed it and the developer who built it. Gaddas *et al.* (2025) observe that hospitals and health providers may face significant legal uncertainties as they promote the integration of artificial intelligence technologies, especially in situations of harm to the patient. This discussion demonstrates that responsibility cannot be shifted to the technology as if it were an autonomous subject, since its use results from human, institutional and economic decisions.

In Brazilian law, although there does not yet exist a specific and complete regime for all damages arising from artificial intelligence in health, the protection of the patient may be

constructed from already existing norms. The Constituição Federal, the Lei nº 8.080/1990, the Lei Geral de Proteção de Dados Pessoais, the Código de Defesa do Consumidor, the Código Civil and professional ethical norms offer bases for discussing the duty of information, the duty of safety, the protection of sensitive data, responsibility for failure in the provision of the service and reparation of damages. However, the complexity of algorithmic systems requires greater regulatory precision, especially as regards auditing, traceability, impact assessment and the identification of those responsible at each stage of the technological cycle.

The protection of sensitive personal data constitutes another central point. The Lei Geral de Proteção de Dados Pessoais recognises data relating to health as sensitive data, imposing greater caution regarding the collection, storage, sharing and processing of this information. However, the analysis demonstrates that data protection, although indispensable, is not sufficient to confront all the risks of artificial intelligence in health. A system may process data in an apparently regular manner and, nevertheless, produce discriminatory decisions, if it has been trained with biased bases or validated without analysis of performance across different population groups.

Therefore, the legal protection of patients must go beyond the dimension of privacy and also reach equality, non-discrimination and care safety. The review by Alderman *et al.* (2025), published in The Lancet Digital Health, points to the need to confront algorithmic bias through transparency, standards for health databases, good governance practices and the participation of different actors in the development and assessment of systems. This perspective reinforces that the quality of data is not merely a technical problem, but also an ethical and legal requirement to prevent the technology from producing selective damages against vulnerable groups.

The international regulatory experience also contributes to the discussion. Mello and Roberts (2024), in analysing new anti-discrimination requirements applicable to health organisations and insurers in the United States, highlight that regulation came to require reasonable efforts to identify whether decision-support tools use protected characteristics as variables and to mitigate risks of discrimination. Although this model does not apply directly to Brazil, it reveals an important trend: institutions that use artificial intelligence in health must assume their own duties of assessment, prevention and mitigation of discrimination.

This point dialogues with the Brazilian reality, since the mere contracting or acquisition of a technological tool cannot remove the responsibility of the institution that uses it. Hospitals, clinics, operators and public services must verify whether the system is adequate to the profile of the population served, whether it was validated for the context in which it will

be applied and whether mechanisms for human review exist. The omission in the assessment of risks may constitute an institutional failure, especially when the harm affects patients in situations of vulnerability. In matters of health, innovation does not eliminate the duty of care; on the contrary, it broadens the need for control, prevention and transparency.

The recent literature has also pointed to the need for professional training for the critical use of these technologies. Cary Jr. *et al.* (2025) highlight that the mitigation of biases in artificial intelligence and machine learning tools requires institutional guidelines and training programmes for the health workforce. This finding is relevant because human supervision will only be effective if professionals understand at least minimally the limits, risks and possibilities of the systems used. Otherwise, the presence of a professional in the decision-making process may function merely as a formal validation of the algorithmic recommendation, without real control over its effects.

Training, however, should not be understood as the exclusive responsibility of professionals. Health institutions also need to create governance flows, technology assessment committees, review protocols, channels for contestation and mechanisms for continuous monitoring. The absence of these structures may turn artificial intelligence into a factor that aggravates vulnerability, especially for patients with less access to information, less capacity for institutional contestation and greater dependence on public or private health services.

The discussion carried out makes it possible to affirm that artificial intelligence may contribute to the improvement of care, but only when subject to consistent legal and ethical parameters. Its use must observe the right to health, the protection of sensitive data, material equality, non-discrimination, patient autonomy, the duty of information, care safety and accountability for damages. When these parameters are neglected, the technology ceases to function as an instrument of care and comes to operate as a silent mechanism of exclusion.

In this way, the results indicate that the main question lies not in accepting or rejecting artificial intelligence in health, but in defining the conditions under which it may be legitimately used. The incorporation of these tools must be accompanied by impact assessment, periodic audits, validation in diverse populations, transparency about limitations, qualified human supervision and accessible mechanisms for contestation. In deeply unequal societies, such as the Brazilian one, technological neutrality must be viewed with caution, since automated systems may reproduce historical inequalities with the appearance of scientific precision. The legal protection of vulnerable patients therefore requires that artificial intelligence be regulated and used from the centrality of the human person, care equity and institutional responsibility.

5 CONCLUSION

The present study aimed to analyse the impacts of the use of artificial intelligence in health care upon patients in situations of vulnerability, with emphasis on the risks of algorithmic discrimination and the challenges related to the legal protection of these individuals. From the bibliographic and documentary analysis carried out, it was found that artificial intelligence has the potential to contribute to the improvement of health services, especially in diagnostic support, in the organisation of care flows, in the prediction of clinical risks and in resource management. However, this potential does not eliminate the legal, ethical and social risks arising from its application in systems marked by structural inequalities.

The research demonstrated that algorithmic systems cannot be understood as neutral instruments. Their recommendations depend on the data used, on the programming criteria, on the validation models and on the institutional conditions in which they are applied. When trained with incomplete, biased or poorly representative bases, these systems may reproduce inequalities already present in society and in health services. In this context, vulnerable patients may be more exposed to inadequate diagnoses, mistaken risk classifications, restriction of access to treatments and less favourable care decisions.

It was also found that algorithmic opacity represents a relevant challenge for the protection of patients. When the criteria used by artificial intelligence systems are not comprehensible or auditable, it becomes more difficult to identify errors, contest decisions and attribute responsibility for possible damages. This situation compromises the right to information, patient autonomy, free and informed consent and care safety itself, especially when the technology influences clinical or administrative decisions of direct impact upon people's lives and health.

On the legal level, it was observed that the protection of sensitive personal data, provided for in the Lei Geral de Proteção de Dados Pessoais, constitutes an indispensable but insufficient element to confront all the risks of artificial intelligence in health. The legal protection of patients also requires mechanisms of transparency, human supervision, auditing, impact assessment, validation in diverse populations and institutional accountability. Thus, the discussion must go beyond the dimension of privacy and reach material equality, non-discrimination, care equity and the duty of care.

It is concluded that artificial intelligence will only be able to contribute to the realisation of the right to health if it is developed and used in a manner compatible with the dignity of the human person, equity and the protection of groups rendered vulnerable. In a reality such as the Brazilian one, marked by profound social, racial, economic and territorial inequalities, the

adoption of intelligent technologies must be accompanied by rigorous legal criteria and permanent institutional control. Otherwise, technological innovation may reinforce historical exclusions under the appearance of neutrality, efficiency and technical precision.

In this way, the study contributes to the legal debate by demonstrating that artificial intelligence applied to health must be analysed not merely as a technological advance, but as a phenomenon capable of directly interfering with the materialisation of fundamental rights. It is recommended that future research deepen the empirical analysis of systems used in health services in Brazil, investigating their concrete impacts upon vulnerable patients, as well as the institutional mechanisms available to prevent biases, repair damages and ensure more transparent, just and humanely supervised decisions.

ACKNOWLEDGEMENTS

I thank the Universidade Estadual de Feira de Santana (UEFS) for the academic and formative contributions that assisted in the development of this study.

ABSTRACT

Paternity studies based on DNA analysis constitute a central pillar of contemporary forensic genetics. The evolution from traditional systems towards multiplex STR platforms, complemented by SNP markers and massively parallel sequencing technologies, has substantially increased the power of discrimination and the resolving capacity in complex filiation scenarios. This chapter presents a comprehensive review of the molecular and genetic foundations underpinning paternity testing, as well as of the principal marker systems used in forensic practice. It also examines advanced statistical models, based on likelihood ratios and Bayesian approaches, which allow an objective and quantitative interpretation of genetic evidence. Furthermore, it addresses the principal challenges in the interpretation of results, including the presence of mutations, consanguinity, alternative kinship scenarios and DNA mixture analysis. Finally, it discusses the recommendations of international bodies, such as the International Society for Forensic Genetics and the Scientific Working Group on DNA Analysis Methods, as well as the emerging trends that are redefining the field, among them the integration of artificial intelligence, the combined use of multiple marker types and the expansion of massively parallel sequencing.

Keywords: Paternity. STR. SNP. Likelihood Ratio. Forensic Genetics.

RESUMO

Os estudos de paternidade baseados em análise de ADN constituem um pilar central da genética forense contemporânea. A evolução desde sistemas tradicionais até plataformas multiplex de STR, complementadas com marcadores SNP e tecnologias de sequenciamento

1 INTRODUCTION

The determination of paternity through DNA analysis constitutes one of the most relevant milestones in the evolution of applied genetics and legal medicine. The turning point came with the development of DNA fingerprinting by Alec Jeffreys in 1985, initially based on the analysis of highly polymorphic minisatellite regions, which for the first time allowed individual identification with unprecedented resolution (Jeffreys *et al.*, 1985).

Since then, the discipline has undergone a transition towards more robust, reproducible and standardised systems, with the adoption of Short Tandem Repeats (STR) as the markers of choice standing out. These systems, combined with amplification by polymerase chain reaction (PCR), have allowed the analysis of minimal or degraded samples, considerably broadening the field of application in forensic and clinical contexts (Butler, 2009).

In the contemporary context, forensic genetics is configured as an interdisciplinary science that integrates:

- a) Molecular biology (structure and variability of DNA)
- b) Bayesian statistics (evaluation of evidence through likelihood ratios)
- c) Population genetics (allelic frequencies and genetic structure)
- d) Bioinformatics (automated analysis of genetic profiles)

This comprehensive approach allows quantifiable and reproducible scientific evidence to be provided in legal scenarios, where the interpretation of results must meet rigorous standards of validity, transparency and reproducibility (Jobling & Gill, 2004).

Additionally, the advance of emerging technologies such as massively parallel sequencing (NGS) has introduced a new dimension into filiation studies, allowing the simultaneous analysis of multiple types of genetic markers and the resolution of cases previously considered indeterminable, such as those involving highly degraded samples or complex kinship relationships (van der Gaag *et al.*, 2016).

2 GENETIC AND MOLECULAR FOUNDATIONS

Paternity studies are based on the principles of Mendelian inheritance, according to which each individual inherits one allele from each parent at each autosomal locus. This codominant transmission allows the parental genetic contribution to be traced through direct comparison of genetic profiles.

2.1 GENETIC VARIABILITY AND STR MARKERS

STR (Short Tandem Repeats) are short repetitive sequences of between 5 and 50 repeats depending on the genetic marker analysed (2–7 base pairs), widely distributed throughout the human genome. Their high rate of polymorphism, derived mainly from replication slippage mechanisms, generates great allelic diversity, which makes them highly informative markers for human identification (Ellegren, 2004).

Each STR locus presents multiple alleles defined by the number of repeats, and the combination of multiple independent loci allows high probabilities of coincidence to be reached among related individuals and extremely low probabilities among unrelated individuals.

2.2 MOLECULAR BASES OF INHERITANCE IN PATERNITY STUDIES

In a typical paternity analysis:

- a) The child's genetic profile must be explainable by the combined contribution of the mother and the alleged father
- b) Each allele of the child must correspond to one present in each parent

Incompatibilities at multiple loci allow paternity to be excluded, whereas concordance at all analysed loci supports inclusion, subject to statistical evaluation.

2.3 ASSUMPTIONS OF POPULATION GENETICS

The probabilistic interpretation of results requires the application of population genetics principles, among them:

- a) Hardy-Weinberg equilibrium

It assumes that genotypic frequencies remain constant in the absence of evolutionary forces. This principle allows genotypic probabilities to be estimated from allelic frequencies.

- b) Independence between loci

The STR loci used must be genetically independent (not linked), which allows individual probabilities to be multiplied (product rule).

- c) Representative allelic frequencies

The calculation of probabilities depends on adequate population databases. A lack of representativeness can introduce bias into the estimation of the Likelihood Ratio.

Deviations from these assumptions, such as population structure or consanguinity, require the application of statistical corrections, such as the θ coefficient of David Balding and Richard Nichols (Balding & Nichols, 1994).

2.4 MUTATION AND STABILITY OF STRS

Mutations in STRs occur at a relatively low frequency ($\sim 10^{-3}$ per generation), but they can affect interpretation in paternity studies. These mutations usually involve the gain or loss of a repeat unit.

In cases of incompatibility at a single locus, it is necessary to consider:

- a) Probability of mutation
- b) Evidence at other loci
- c) Adjusted statistical models
- d) Allelic losses

2.5 PROBABILISTIC MODELS AND THE BAYESIAN FRAMEWORK

The evaluation of genetic evidence is carried out by calculating the likelihood ratio (Likelihood Ratio, LR), which compares the probability of the data under two alternative hypotheses. (Figure 1)

This approach is integrated within Bayes' theorem, allowing the posterior probability of paternity to be calculated from:

- a) Genetic evidence (CPI)
- b) Prior probability

The application of this probabilistic framework is essential for the objective and quantitative interpretation of results in forensic genetics (Kling *et al.*, 2014).

Practical example of paternity calculation (expert report type)

A case with mother, child and alleged father is analysed. Three STR loci are studied.
Locus 1: Mother (10,12), Child (10,14), Alleged father (14,15) Locus 2: Mother (8,9), Child (9,11), Alleged father (11,12) Locus 3: Mother (13,14), Child (13,15), Alleged father (15,16)

Calculation of the Paternity Index (PI):

Locus 1: $PI = 1 / \text{frequency}(14) = 1 / 0.1 = 10$ Locus 2: $PI = 1 / \text{frequency}(11) = 1 / 0.2 = 5$ Locus 3: $PI = 1 / \text{frequency}(15) = 1 / 0.1 = 10$

$CPI = 10 \times 5 \times 10 = 500$

Probability of paternity:

$W = (CPI \times 0.5) / (CPI \times 0.5 + 0.5)$ $W = (500 \times 0.5) / (500 \times 0.5 + 0.5) = 0.998$ Probability = 99.8%

Expert interpretation

The results are compatible with paternity. The probability obtained indicates very strong evidence in favour of the alleged father being the biological father, as opposed to the hypothesis that he is not.

Figure 1. LR, kinship trees, Bayesian scenarios

The image corresponds to a composite panel with three advanced forensic genetics diagrams (A, B and C) that illustrate key concepts in paternity studies:

A) Likelihood Ratio (LR) graph

This panel shows how the likelihood ratio (LR) evolves as a function of the number of STR loci analysed.

- a) X axis: number of STR loci
- b) Y axis: value of the LR on a logarithmic scale
- c) Blue line (H1): hypothesis that the alleged father is the biological father
- d) Red line (H2): hypothesis that an unrelated individual is the father

It is observed that:

- a) As the number of loci increases, the LR grows exponentially
- b) A marked point (≈ 10 loci) shows an LR of 10,000
- c) Interpretation zones are delimited:
- d) Evidence in favour of H1 (paternity)
- e) Evidence in favour of H2 (non-paternity)

This graph illustrates how the discriminatory power increases with more genetic markers.

B) Genealogical tree (pedigree)

It represents a complex kinship scenario:

- a) Upper part: grandparents (grandfather and grandmother)
- b) Second generation: Alleged father (with question mark); Brother of the alleged father
- c) Third generation: Mother; Child (individual under study); Another descendant (grandchild)

Characteristics:

- a) Use of standard symbols: Squares = men; Circles = women
- b) The "?" sign indicates uncertainty in the filiation

This type of diagram is used to evaluate alternative hypotheses (e.g. the brother could be the biological father).

C) Bayesian decision tree

It shows the logical structure of probabilistic analysis in paternity:

- a) Two hypotheses are posed: H1: alleged father is the father (prior = 0.5); H2: unrelated individual is the father (prior = 0.5)

Each hypothesis is divided into:

- a) Compatible genotype
- b) Incompatible genotype

Then conditional probabilities are assigned:

- a) $P(D|H1)$
- b) $P(D|H2)$

Finally, the formula for the probability of paternity is presented:

$$W = \frac{CPI \times prior}{(CPI \times prior) + (1 - prior)} \quad (1)$$

This scheme summarises how the genetic evidence (CPI) is integrated with prior probabilities within a Bayesian framework.

Global interpretation

The figure integrates three key levels of analysis in forensic genetics:

- a) Quantitative (LR) → measures the strength of the evidence
- b) Genealogical (pedigree) → defines possible biological relationships
- c) Probabilistic (Bayes) → integrates evidence and context

Figure 1

A. Likelihood Ratio as a function of the number of STR loci. Relationship between the number of STR loci analysed and the value of the Likelihood Ratio (LR) on a logarithmic scale. Increasing the number of genetic markers exponentially increases the strength of the evidence in favour of the paternity hypothesis. B. Pedigree in a complex kinship scenario. Genealogical diagram illustrating a filiation scenario with alternative hypotheses, including the possibility of collateral kinship (brother of the alleged father). Standard forensic genetics symbols are used. C. Bayesian model in paternity studies. Bayesian decision tree showing the evaluation of hypotheses (H1 and H2) as a function of genetic compatibility, integrating conditional probabilities for the calculation of the probability of paternity

3 MARKER SYSTEMS IN FORENSIC GENETICS

The selection of genetic markers constitutes a critical element in paternity and kinship studies. Current systems combine highly polymorphic markers, with well-characterised inheritance and predictable statistical behaviour. The contemporary trend is oriented towards integrated approaches that combine STR, SNP and sequence information through high-throughput platforms.

3.1 AUTOSOMAL STRS

Autosomal Short Tandem Repeats (STR) represent the reference standard in forensic genetics due to their high power of discrimination, analytical robustness and compatibility with

international databases. These markers consist of tandem repeats of short sequences (2–6 bp), whose variability in the number of repeats generates multiple alleles per locus.

Current commercial systems (for example, GlobalFiler™ or PowerPlex® Fusion) include more than 24 STR loci, many of them integrated into the expanded panels of the CODIS system. The combination of multiple independent loci allows extremely low probabilities of coincidence to be reached ($<10^{-15}$), which is fundamental in contexts of individual identification and paternity (Butler, 2009).

From the technical point of view, STRs present key characteristics:

- a) High heterozygosity (>0.7 at many loci).
- b) Efficient amplification by multiplex PCR.
- c) Compatibility with capillary electrophoresis and multichannel fluorescence.
- d) Interpretation based on peak patterns (electropherograms) (Figure 3).

Nevertheless, they present inherent limitations, such as the appearance of artefacts (stutter), allelic drop-out in degraded samples and relatively frequent mutations ($\sim 10^{-3}$), which must be considered in expert interpretation (Ellegren, 2004; DOI: 10.1038/nrg1348).

3.2 Y-STR AND X-STR

Y-STR (Y chromosome)

STR markers of the Y chromosome are inherited in a strictly paternal manner without significant recombination (except in pseudoautosomal regions). This allows complete male lineages to be analysed through haplotypes.

Main applications:

- a) Cases in which the alleged father is not available
- b) Analysis of sexual assaults with male-female mixtures
- c) Paternal lineage studies

However, the absence of recombination implies that individuals related through the paternal line share the same haplotype, which limits their power of individual discrimination (Kayser, 2017).

X-STR (X chromosome)

Markers of the X chromosome present particular patterns of inheritance:

- a) Males are hemizygous (a single allele)
- b) Females present two alleles with recombination

This makes them especially useful tools in:

- a) Filiation cases involving daughters
- b) Reconstruction of kinship in the absence of the father

c) Evaluation of complex relationships (grandparenthood, maternal uncles)

The analysis of X-STR requires specific statistical models that consider partial linkage and recombination, which increases its interpretative complexity.

3.3 FORENSIC SNPS

Single Nucleotide Polymorphisms (SNPs) represent point variations in the genome and constitute an alternative to or complement of STRs in forensic genetics.

Main advantages:

- a) Short amplicons (<100 bp), ideal for degraded DNA
- b) Low mutation rate ($\sim 10^{-8}$), which improves intergenerational stability
- c) High genomic density (millions of SNPs available)

Limitations:

- a) Lower individual polymorphism (generally biallelic)
- b) They require a larger number of markers to reach discriminatory power comparable to STR
- c) Moderate cost

SNPs are used in:

- a) Analysis of distant kinship
- b) Identification in highly degraded samples
- c) Inference of biogeographical ancestry

The use of high-density SNP panels, together with Bayesian models, allows kinship relationships beyond the first degree to be evaluated (Phillips, 2015).

3.4 MASSIVELY PARALLEL SEQUENCING (NGS/MPS)

Next-Generation Sequencing (NGS) or Massively Parallel Sequencing (MPS) technologies represent a paradigmatic transformation in forensic genetics.

Unlike capillary electrophoresis, which only detects the length of fragments, NGS allows the complete sequence of DNA to be analysed, which provides multiple advantages:

Key advantages:

- a) Identification of isoalleles (same size, different sequence)
- b) Greater power of discrimination at STR loci
- c) Simultaneous analysis of STR, SNP, InDels and mitochondrial DNA
- d) Better resolution in complex mixtures

Advanced applications:

- a) Resolution of complex kinship cases

- b) Differentiation of related individuals
- c) Analysis of highly degraded samples
- d) Integration with artificial intelligence for interpretation

Current limitations:

- a) High cost
- b) Need for standardisation
- c) Bioinformatic complexity
- d) Forensic validation requirements

Various studies have demonstrated that NGS significantly improves the capacity for discrimination compared with traditional methods, especially when multiple types of markers are combined (van der Gaag *et al.*, 2016).

3.5 INTEGRATED APPROACHES IN MODERN FORENSIC GENETICS

The current trend is the combined use of different marker systems:

- a) Autosomal STR → primary identification
- b) Y-STR / X-STR → specific lineage cases
- c) SNP → degraded samples and distant kinship
- d) NGS → advanced resolution

This multimodal approach allows the robustness of the analysis to be maximised and the interpretation in complex scenarios to be improved, consolidating forensic genetics as a highly integrated and technologically advanced discipline.

3.6 COMPARISON OF MARKER SYSTEMS

In modern forensic practice, the selection of the marker system depends on the type of sample, the biological relationship investigated and the complexity of the case. The following table summarises the key characteristics of the principal systems used. (Table 1)

Table 1

Comparison of STR, SNP and NGS in forensic genetics

Characteristic	Autosomal STR	SNPs	NGS/MPS
Type of marker	Tandem repeats (2–6 bp)	Single nucleotide variation	Complete sequencing
Polymorphism	High (multiallelic)	Low (biallelic)	Very high (includes internal variation)
Power of discrimination	Very high (with 15–25 loci)	Moderate (requires hundreds)	Very high
Amplicon size	100–400 bp	<100 bp	Variable

Main application	Paternity, identification	Degraded DNA, distant kinship	Complex cases
Sensitivity to degradation	Moderate	High (better performance)	Very high
Mutation	Relatively high ($\sim 10^{-3}$)	Very low ($\sim 10^{-8}$)	Variable
Interpretation	Relatively simple	Requires statistical models	Complex (bioinformatics)
Cost	Low–moderate	Moderate	High
Forensic standard	Yes (gold standard)	Complementary	Emerging

Source: prepared by the authors.

3.7 INTEGRATED STR + SNP APPROACH IN COMPLEX CASES

The combination of STR and SNP represents an optimal strategy in scenarios where STRs alone do not provide conclusive evidence, such as in:

- a) Collateral kinship (siblings, uncle–nephew or avuncular)
- b) Degraded DNA
- c) Cases with mutations
- d) Absence of one of the parents

4 ADVANCED PRACTICAL EXAMPLE: COMBINED STR + SNP ANALYSIS

4.1 CONTEXT OF THE CASE

A filiation case is analysed in which:

- a) The mother is not available
- b) The alleged father has a biological brother
- c) There is a suspicion that the defendant or his brother could be the true biological father

Classic scenario of complex alternative hypotheses:

- a) H1: The alleged father is the biological father
- b) H2: The brother of the alleged father is the father

4.2 RESULTS WITH STR (LIMITED)

Fifteen STR loci are analysed:

- a) Complete match at all loci
- b) CPI obtained: 2,500

Preliminary interpretation:

- a) Compatible with paternity
- b) BUT: the brother shares a large genetic proportion → inconclusive evidence

4.3 INCORPORATION OF SNPS

Two hundred independent informative SNPs are analysed.

Results:

- a) Multiple SNPs are identified where: The child shares alleles with the alleged father; But not with the brother

Calculation:

- a) LR based on SNPs: 150

4.4 INTEGRATION OF EVIDENCE (COMBINED MODEL)

Given that the systems are independent:

$$LR_{total} = LR_{STR} \times LR_{SNP} \quad (2)$$

4.5 PROBABILITY OF PATERNITY

$$W = \frac{LR}{LR+1} \quad (3)$$

$$W \approx 0.999997 \quad (4)$$

Probability of paternity = 99.9997%

4.6 EXPERT INTERPRETATION

- a) Analysis based solely on STR in this case does not allow a conclusive result to be obtained in relation to the alleged father or his brother
- b) The incorporation of SNPs significantly increases the power of discrimination
- c) The combined evidence provides extremely strong support in favour of H1

4.7 TECHNICAL DISCUSSION

This case illustrates several key principles of advanced forensic genetics:

1. Limitation of STR in close kinship

First-degree relatives share up to 50% of DNA, which reduces the discriminatory capacity of STRs.

2. Advantage of SNP

SNPs allow:

- a) Greater resolution in complex kinship
- b) Evaluation of finer genetic differences

3. Importance of the Bayesian model

The integration of multiple sources of evidence improves the robustness of the result.

4. Independence of markers

It is fundamental to guarantee that STR and SNP are statistically independent in order to apply the multiplication of LR_s.

5. Conclusion of the section

The combined use of STR, SNP and NGS technologies represents the emerging standard in advanced forensic genetics. This approach allows complex scenarios to be addressed with a level of precision significantly superior to that of traditional methods, consolidating a paradigm of multimodal analysis.

5 ANALYTICAL WORKFLOW AND VALIDATION

DNA analysis in forensic genetics follows a highly standardised workflow, designed to guarantee the integrity, traceability and reproducibility of results. This process is divided into pre-analytical, analytical and post-analytical phases, each with specific quality controls. (Figure 2)

Figure 2

Workflow of DNA analysis in paternity studies. Standardised analytical workflow in forensic genetics, from sample collection to interpretation of the genetic profile. It includes the stages of extraction, amplification by PCR, separation by capillary electrophoresis and analysis of results

Source: prepared by the authors.

5.1 PRE-ANALYTICAL PHASE: COLLECTION AND CHAIN OF CUSTODY

Sample collection constitutes a critical point, since any contamination or error in identification can compromise the validity of the analysis.

Key elements:

- Unequivocal identification of individuals
- Complete documentation of the chain of custody
- Use of sterile materials and negative controls
- Adequate conditions of transport and storage

The chain of custody must guarantee the legal continuity of the evidence from its collection to its analysis in the laboratory.

5.2 EXTRACTION AND QUANTIFICATION OF DNA

DNA extraction is carried out by validated methods (silica, magnetic resins or organic extraction), optimised to maximise yield and minimise inhibitors.

Quantification by real-time PCR (qPCR) allows evaluation of:

- Amount of nuclear DNA
- Degradation index

c) Presence of inhibitors

These parameters are essential for deciding the subsequent amplification strategy.

5.3 AMPLIFICATION BY MULTIPLEX PCR

The simultaneous amplification of multiple STR loci by multiplex PCR constitutes the core of the analysis.

Technical considerations:

- a) Optimisation of reaction conditions
- b) Control of artefacts (stutter, pull-up, allelic drop-out)
- c) Inclusion of positive and negative controls

The sensitivity of the system allows minimal amounts of DNA to be analysed (down to the picogram range), which is fundamental in forensic samples.

5.4 SEPARATION AND DETECTION: CAPILLARY ELECTROPHORESIS

The amplified products are separated by capillary electrophoresis and detected by fluorescence.

Critical parameters:

- a) Analytical threshold (minimum signal detection)
- b) Stochastic threshold (risk of allelic loss)
- c) Balance of heterozygous peaks

The result is an electropherogram, which represents the genetic profile of the individual.

Figure 3

Representative electropherogram of STR markers. Schematic example of an electropherogram obtained by capillary electrophoresis, showing peaks corresponding to STR alleles. The height of the peaks reflects the intensity of the fluorescent signal and allows interpretation of the genetic profile

**Leyenda**

Ejemplo esquemático de un electroferograma obtenido mediante electroforesis capilar, mostrando picos correspondientes a alelos STR. La altura de los picos refleja la intensidad de señal fluorescente y permite la interpretación del perfil genético. Esta figura ilustra la combinación de múltiples loci STR y el sistema de determinación de sexo (AMEL: X e Y).

5.5 INTERPRETATION OF GENETIC PROFILES

The interpretation requires a critical evaluation of:

- Allelic concordance between individuals
- Presence of artefacts
- Quality of the signal

In complex cases (mixtures, degradation), advanced probabilistic models and specialised software are used.

5.6 VALIDATION AND QUALITY ASSURANCE

The guidelines of the Scientific Working Group on DNA Analysis Methods establish strict criteria for the validation of methods in forensic genetics (SWGDM, 2016).

Validation studies include:

- Sensitivity: minimum limit of detection
- Specificity: capacity to discriminate human DNA
- Reproducibility: intra- and inter-laboratory consistency
- Precision: concordance with expected values
- Robustness: tolerance to experimental variations

In addition, laboratories must comply with quality standards such as ISO/IEC 17025, ensuring technical competence and the traceability of results.

6 ADVANCED STATISTICAL INTERPRETATION

The interpretation of paternity studies is based on a formal probabilistic framework, in which the genetic evidence is evaluated by means of the likelihood ratio (Likelihood Ratio, LR).

6.1 STATEMENT OF HYPOTHESES

In the forensic context, two mutually exclusive hypotheses are established:

- a) H1: the alleged father is the biological father
- b) H2: the biological father is any random individual from the population.

The objective is to evaluate which hypothesis better explains the observed genetic data.

6.2 PATERNITY INDEX (PI)

The paternity index is calculated for each locus as:

$$PI = \frac{P(\text{genotipo del hijo}|H1)}{P(\text{genotipo del hijo}|H2)} \quad (5)$$

This value depends on:

- a) Allelic frequency in the population
- b) Genotype of the alleged father
- c) Genotype of the child (and mother, if available)

6.3 COMBINED PATERNITY INDEX (CPI)

Given that the loci are independent:

$$CPI = \prod PI_i \quad (6)$$

The CPI represents the accumulated strength of the genetic evidence.

6.4 PROBABILITY OF PATERNITY (BAYESIAN MODEL)

$$W = \frac{CPI \cdot prior}{CPI \cdot prior + (1 - prior)} \quad (7)$$

Where:

- a) W = probability of paternity
- b) prior = prior probability (generally 0.5)

This approach integrates genetic evidence with prior information, allowing a quantitative interpretation.

6.5 INTERPRETATION OF THE LIKELIHOOD RATIO

The LR is interpreted in terms of strength of evidence (Table 2):

Table 2

Interpretation of the Likelihood Ratio

LR	Interpretation
<1	Evidence in favour of H2
1–10	Weak evidence
10–100	Moderate evidence
100–10,000	Strong evidence
>10,000	Very strong evidence

Source: prepared by the authors.

This framework is consistent with international recommendations in forensic genetics.

6.6 FACTORS THAT AFFECT INTERPRETATION

- a) Allelic frequencies

The choice of the reference population is critical.

- b) Population substructure

Corrections are applied (θ of Balding-Nichols) to avoid overestimation of the LR.

- c) Mutations

They must be incorporated into the model when there are incompatibilities at one or a few loci.

- d) Dependence between loci

In cases of linked markers (e.g. X-STR), specific models are required.

6.7 ADVANCED MODELS

In complex scenarios the following are used:

- a) Extended Bayesian models
- b) Monte Carlo simulation
- c) Specialised software (Familias, DNA-View)

These approaches allow alternative hypotheses, such as collateral kinship, to be evaluated.

7 COMPLEX SCENARIOS IN PATERNITY STUDIES

In forensic genetics, paternity studies are not always conducted under ideal conditions. Various biological, technical and population factors can introduce ambiguities into the interpretation of genetic profiles. The correct resolution of these scenarios requires the application of advanced probabilistic models, in-depth knowledge of molecular genetics and the use of specialised analytical tools.

7.1 MUTATIONS IN STR

Mutations at STR loci constitute one of the main causes of apparent discrepancies in paternity studies. These occur at an approximate frequency of 10^{-3} per locus per generation and usually involve the gain or loss of a repeat unit, attributed mainly to replication slippage mechanisms.

Forensic implications:

- a) An incompatibility at one or two loci does not necessarily exclude paternity.
- b) The global pattern of the genetic profile must be evaluated.
- c) It is necessary to consider the specific mutation rate per locus.
- d) In these cases it is suggested to increase the number of STRs studied in order to find incompatibilities or not

Interpretative approach:

Models are applied that incorporate mutation probabilities into the calculation of the paternity index (adjusted PI). This allows erroneous exclusions to be avoided in the presence of mutations (Ellegren, 2004).

7.2 ALTERNATIVE KINSHIP

In many cases, the alleged father may have close relatives (siblings, uncles, cousins) who share a significant proportion of their genetic material. This can generate profiles compatible with the child, making discrimination between hypotheses difficult.

Typical scenarios:

- a) Brother of the alleged father as possible progenitor
- b) Paternal uncle
- c) Paternal grandfather

Analytical approach:

- a) Formulation of alternative hypotheses (H1 vs extended H2)
- b) Calculation of specific Likelihood Ratios for each relationship
- c) Use of specialised software (e.g. Familias, DNA-View)

The use of additional markers such as SNP or X-STR can significantly improve the discriminatory capacity in these cases (Kling *et al.*, 2014).

7.3 CONSANGUINITY

Consanguinity introduces genetic dependence between alleles, violating the assumption of independence between loci and affecting the estimation of probabilities.

Main effects:

- a) Increase in the probability of sharing alleles by identity by descent
- b) Overestimation of the Likelihood Ratio if not corrected
- c) Greater complexity in statistical interpretation

Applied corrections:

- a) Use of the θ (theta) coefficient of population structure
- b) Adjustments to allelic frequencies
- c) Bayesian models with inbreeding parameters

The models developed by David Balding and Richard Nichols are widely used for these corrections (Balding & Nichols, 1994).

7.4 DNA MIXTURES

DNA mixtures represent one of the most challenging scenarios in forensic genetics. They occur when the analysed genetic profile contains contributions from two or more individuals.

Main difficulties:

- a) Overlap of alleles
- b) Imbalance in signal intensities
- c) Presence of artefacts

Modern approaches:

- a) Continuous probabilistic models

- b) Analysis based on Likelihood Ratios
- c) Use of specialised software such as: STRmix™; TrueAllele®

These systems allow the probability of contribution of each individual to the mixture to be estimated, improving the objectivity of the analysis (Gill *et al.*, 2012).

7.5 MONOZYGOTIC TWINS

Monozygotic twins share practically 100% of their nuclear DNA, which makes them indistinguishable by conventional STR analysis.

Limitations:

- a) Impossibility of differentiation with standard methods
- b) Complete match in STR and SNP profiles

Advanced strategies:

- a) Next-Generation Sequencing (NGS) to detect somatic mutations
- b) Epigenetic analysis (DNA methylation patterns)
- c) Whole-genome sequencing

These approaches allow minimal differences accumulated after zygotic division to be identified, although their application in routine forensics is still limited (Jobling & Gill, 2004).

7.6 OTHER RELEVANT COMPLEX SCENARIOS

- a) Degraded DNA

Frequent in old forensic samples or those exposed to adverse conditions. It can produce:

- a) Allelic drop-out
- b) Incomplete profiles

SNPs and short amplicons are preferable in these cases.

- b) Absence of one of the parents

It requires:

- a) Genotypic reconstruction
- b) Use of relatives (grandparents, siblings)
- c) Extended kinship models
- c) Multiple mutations or microvariants

They can complicate interpretation if not adequately recognised, especially in automated analyses.

Conclusion of the section:

Complex scenarios represent a central challenge in modern forensic genetics. Their adequate resolution depends on the integration of multiple marker systems, advanced statistical models and specialised bioinformatic tools. The evolution towards multimodal approaches, including STR, SNP and NGS, allows many of the traditional limitations to be overcome, increasing the precision and reliability of paternity studies in real contexts.

7.7 ANALYSIS OF APPLIED CASES IN PATERNITY STUDIES USING STR

In order to complement the theoretical scenarios previously described, applied filiation cases were analysed using autosomal STR markers, evaluating the allelic concordance between the genetic profiles of the child and the alleged father.

This analysis allows the illustration of how the principles of Mendelian inheritance, together with probabilistic models, are applied in real contexts of forensic genetics, including both paternity exclusion and inclusion situations.

a) Cases of paternity exclusion

In a set of analysed cases, multiple allelic incompatibilities were identified at different STR loci, such as D3S1358, D18S51, FGA and D21S11. These discrepancies cannot be explained by normal biological inheritance and, when they occur at more than one independent locus, they constitute conclusive evidence for the exclusion of paternity.

Although point mutations may justify isolated discordances, the presence of multiple simultaneous incongruities rules out this possibility, reinforcing the expert interpretation of non-filiation. (Table 3)

Table 3

Cases of paternity exclusion

Locus	Mother	Child	Alleged father	Compatibility	Interpretation
D3S1358	17,18	16,18	16,16	Not compatible	Exclusion
D18S51	14,17	14,15	10,16	Not compatible	Exclusion
FGA	22,23	25,26	25,26	Partially compatible	Exclusion (multiple loci)

Source: prepared by the authors.

b) Cases of paternity inclusion

In contrast, other cases showed complete concordance at all analysed loci, where each allele of the child is compatible with the genetic contribution of the alleged father (obligatory paternal allele). This pattern is consistent with the inclusion of paternity, although from the forensic point of view it necessarily requires statistical support through the calculation of the Paternity Index (PI) and the Combined Paternity Index (CPI).

These results show how genetic concordance, when evaluated across multiple independent markers, provides a robust basis for inferring biological relationships. (Table 4).

Table 4

Cases of paternity inclusion

Locus	Mother	Child	Alleged father	Compatibility	Interpretation
D3S1358	14,15	14,16	16,18	Compatible	Inclusion
D18S51	12,13	12,17	17,20	Compatible	Inclusion
FGA	22,23	23,24	21,24	Compatible	Inclusion

Source: prepared by the authors.

c) Relevance in complex scenarios

The incorporation of these cases allows contextualisation of the challenges described in this section, particularly in situations where factors such as the following may coexist:

- a) Mutations in STR
- b) Alternative kinship
- c) Limitations in the number of markers

In this sense, although the cases presented correspond to relatively straightforward scenarios (inclusion/exclusion), their analysis reinforces the need to integrate statistical tools and, in complex cases, to complement them with other marker systems such as SNP or NGS.

Taken together, these examples illustrate the practical application of DNA analysis in forensic genetics and its role in well-founded expert decision-making.

8 POPULATION DATABASES

The calculation of the likelihood ratio (Likelihood Ratio, LR) in paternity studies depends critically on the quality, representativeness and adequacy of the population databases used to estimate allelic frequencies. These databases constitute the statistical foundation on which the paternity indices (PI) and the combined index (CPI) are built, so that any bias or error in their selection can significantly affect the final interpretation.

8.1 SELECTION OF REFERENCE POPULATIONS

The choice of an adequate reference population is essential to guarantee valid estimates of allelic frequencies.

Key criteria:

- a) Geographical correspondence with the individuals analysed
- b) Genetic affinity (ethnic origin and ancestry)

- c) Sufficient sample size (generally >200 individuals)
- d) Periodic updating of the database

The use of non-representative populations can lead to an overestimation or underestimation of the LR, affecting the validity of the expert result.

8.2 HARDY-WEINBERG EQUILIBRIUM

Population databases should ideally comply with Hardy-Weinberg equilibrium (HWE), which allows independence between alleles within a locus to be assumed.

Importance:

- a) It allows genotypic probabilities to be calculated from allelic frequencies.
- b) It is a fundamental assumption in the calculation of the PI.

Deviations:

- a) Inbreeding
- b) Natural selection
- c) Population structure

These deviations must be evaluated by statistical tests and, if necessary, corrected.

8.3 POPULATION SUBSTRUCTURE AND θ CORRECTION

Human populations are not genetically homogeneous, which generates substructures that can influence the distribution of allelic frequencies.

To address this problem, the θ (theta) coefficient, developed by David Balding and Richard Nichols, is used.

Function of θ :

- a) Adjust genotypic probabilities
- b) Avoid overestimation of the LR
- c) Introduce a conservative approach into the analysis

Typical values:

- a) $\theta = 0.01$ (large and well-mixed populations)
- b) $\theta = 0.03$ (structured or isolated populations)

8.4 ETHNIC VARIABILITY AND GENETIC DIVERSITY

Genetic variability between human populations is a determining factor in forensic interpretation.

Considerations:

- a) Differences in allelic frequencies between ethnic groups

- b) Influence of migration, genetic admixture and isolation
- c) Importance of regional databases

In Latin American contexts, characterised by high genetic admixture and ethnic variety, it is particularly relevant to consider population heterogeneity in order to avoid biases.

8.5 SIZE AND QUALITY OF DATABASES

The precision of the estimates depends directly on the sample size and the quality of the data.

Requirements:

- a) Adequate size (≥ 200 –500 individuals per population)
- b) Quality control in genotyping
- c) Elimination of inconsistent data
- d) Inter-laboratory validation

Small databases can generate unstable estimates and increase the uncertainty in the calculation of the LR.

8.6 INDEPENDENCE BETWEEN LOCI

The calculation of the CPI assumes independence between the analysed loci. However, this condition may not be fully met in some cases.

Factors that affect independence:

- a) Genetic linkage
- b) Selection of nearby loci
- c) Use of markers of the X or Y chromosome

In these cases, specific statistical models that consider partial dependence must be applied.

8.7 INTERNATIONAL DATABASES

Various initiatives have allowed the standardisation of databases at a global level:

- a) International Society for Forensic Genetics
- b) FBI CODIS
- c) EDNAP

These platforms provide:

- a) Validated allelic frequencies
- b) Comparability between laboratories
- c) Standardisation of markers

8.8 IMPACT OF ERRORS IN ALLELIC FREQUENCIES

Errors in the selection or estimation of allelic frequencies can generate:

- a) Overestimation of the LR → risk of false inclusions
- b) Underestimation of the LR → loss of evidence
- c) Biased interpretations

For this reason, it is fundamental to adopt a conservative and transparent approach in the selection of databases.

8.9 EMERGING TRENDS

The development of new technologies is transforming the use of population databases:

- a) High-density SNP databases
- b) Integration of massive genomic data (big data)
- c) More complex Bayesian models
- d) Use of artificial intelligence for frequency estimation

These innovations will allow the precision of forensic analyses to be improved in the future.

Conclusion of the section

Population databases constitute a fundamental pillar in the statistical interpretation of paternity studies. Their correct selection, validation and application is essential to guarantee reliable and scientifically sound results. The consideration of factors such as population substructure, genetic variability and data quality allows biases to be minimised and the validity of the conclusions in the forensic field to be strengthened.

9 ETHICAL AND LEGAL CONSIDERATIONS

Paternity analysis through DNA, while constituting a highly precise scientific tool, carries ethical, legal and social implications of great relevance. Genetic information is intrinsically sensitive, since it not only identifies an individual but also reveals biological relationships, family backgrounds and, potentially, medical information. For this reason, its handling must be governed by strict principles of bioethics, confidentiality and professional responsibility.

9.1 INFORMED CONSENT

Informed consent is a fundamental requirement in the conduct of paternity studies. It must be:

- a) Free and voluntary, without external coercion

- b) Specific, clearly indicating the purpose of the analysis
- c) Understandable, adapted to the educational level of the individual
- d) Documented, by means of the signature of the participants

Key aspects that must be explained:

- a) Nature of the genetic study
- b) Possible results (inclusion, exclusion, inconclusive)
- c) Technical limitations
- d) Legal and family implications

In the case of minors, consent must be granted by the legal representatives, always respecting the principle of the best interest of the child.

9.2 PROTECTION OF GENETIC DATA AND CONFIDENTIALITY

Genetic data are considered highly sensitive information. Their handling must comply with principles of:

- a) Strict confidentiality
- b) Restricted access to authorised personnel
- c) Secure storage (physical and digital)
- d) Use limited to the authorised purpose

In many legal systems, genetic data are protected by specific personal data protection regulations. The improper use of this information can have significant legal and ethical consequences.

In addition, laboratories must establish clear policies regarding:

- a) Time of storage of samples
- b) Secure elimination of data
- c) Secondary use of the information

9.3 PSYCHOSOCIAL IMPACT

The results of a paternity test can have profound consequences in the lives of individuals and their families.

Possible effects:

- a) Alteration of personal identity
- b) Family conflicts
- c) Legal implications (custody, inheritance)
- d) Emotional and psychological stress
- e) Identity conflicts

For this reason, it is recommended to:

- a) Offer counselling before and after the test
- b) Communicate results in a clear and empathetic manner
- c) Avoid erroneous interpretations of probabilistic results
- d) Deliver a reliable and conclusive result

The adequate communication of the uncertainty and the statistical significance of the results is crucial to prevent misunderstandings.

9.4 LEGAL USE AND PROBATIVE VALUE

In the judicial sphere, paternity studies have a high probative value, but their admissibility depends on:

- a) Compliance with the chain of custody
- b) Validation of the laboratory
- c) Scientifically accepted methodology
- d) Interpretation in accordance with international standards

The expert in forensic genetics must:

- a) Present results in an objective and impartial manner
- b) Clearly explain the meaning of the Likelihood Ratio
- c) Avoid absolute statements (100% certainty)

Genetic evidence must be contextualised within the body of evidence of the judicial process.

9.5 TRANSPARENCY AND INTERPRETATION OF RESULTS

The recommendations of the International Society for Forensic Genetics emphasise the need for:

- a) Transparency in the methods used
- b) Clarity in the presentation of results
- c) Adequate use of probabilistic language
- d) Communication understandable for judges and lawyers

One of the main challenges is to avoid the prosecutor's fallacy, which consists of incorrectly interpreting the genetic probability as absolute certainty.

9.6 REGULATION AND INTERNATIONAL STANDARDS

The practice of forensic genetics is regulated by various international guidelines and standards, among them:

- a) Scientific Working Group on DNA Analysis Methods
- b) International Organization for Standardization (ISO/IEC 17025)
- c) International Society for Forensic Genetics

These bodies establish criteria on:

- a) Validation of methods
- b) Quality control
- c) Statistical interpretation
- d) Reporting of results

Compliance with these standards is essential to guarantee the acceptance of the results in the judicial sphere.

9.7 EMERGING ETHICAL DILEMMAS

Technological advances have generated new ethical challenges:

- a) Use of genetic databases for unforeseen purposes
- b) Analysis without consent (legal or forensic cases)
- c) Indirect genetic identification (familial searching)
- d) Application of artificial intelligence in forensic genetics

These scenarios require a balance between scientific advance and the protection of individual rights.

Conclusion of the section

Ethical and legal considerations are an essential component in paternity studies through DNA. Scientific precision must be accompanied by responsible handling of genetic information, guaranteeing respect for individual rights, transparency in interpretation and adequate communication of results. The strengthening of regulatory frameworks and the ethical training of professionals are fundamental to ensure a fair, reliable and socially responsible forensic practice.

10 EMERGING TRENDS IN FORENSIC GENETICS

Forensic genetics is in a phase of accelerated transformation driven by advances in biotechnology, computational sciences and data analysis. These innovations are redefining the limits of genetic identification, allowing previously unsolvable scenarios to be addressed and significantly increasing the precision, sensitivity and scope of paternity and kinship studies.

10.1 INTEGRATION OF ARTIFICIAL INTELLIGENCE IN THE INTERPRETATION OF GENETIC PROFILES

The incorporation of artificial intelligence (AI) and machine learning algorithms is revolutionising the interpretation of complex genetic data, particularly in the analysis of DNA mixtures.

Main applications:

- a) Probabilistic modelling of contributors in complex mixtures
- b) Automatic classification of genetic profiles
- c) Optimisation of parameters in electropherograms
- d) Reduction of subjective bias in interpretation

Current probabilistic systems (e.g. STRmix™, TrueAllele®) already incorporate elements of advanced computational modelling, and the evolution towards more sophisticated AI will allow:

- a) Real-time analysis
- b) Integration of multiple types of data (STR, SNP, NGS)
- c) Greater inter-laboratory reproducibility

Limitations:

- a) Need for rigorous validation
- b) "Black box" problems (interpretability)
- c) Regulatory requirements

10.2 COMBINED USE OF STR AND SNP

The multimodal approach that integrates STR and SNP has been consolidated as a key strategy in advanced forensic genetics.

Advantages:

- a) Complementarity: STR (high variability) + SNP (high stability)
- b) Greater power of discrimination in complex kinship
- c) Better performance in degraded samples

Applications:

- a) Identification in cases of collateral kinship
- b) Genetic reconstruction in the absence of progenitors
- c) Resolution of ambiguities in traditional analyses

This approach represents a transition towards integrated models of genetic evidence, in which different types of markers contribute jointly to the probabilistic evaluation.

10.3 MASSIVELY PARALLEL SEQUENCING (NGS/MPS) IN FORENSIC GENETICS

Massively parallel sequencing technologies have introduced a paradigmatic change by allowing the simultaneous analysis of multiple regions of the genome with sequence-level resolution.

Key advantages:

- a) Identification of isoalleles in STR
- b) Simultaneous analysis of STR, SNP, InDels and mitochondrial DNA
- c) Greater resolution in complex mixtures
- d) Capacity to work with highly degraded DNA

Emerging applications:

- a) Identification in mass disasters
- b) Analysis of ancient or degraded remains
- c) Differentiation between genetically close individuals

Challenges:

- a) Costs and accessibility
- b) Standardisation of protocols
- c) Validation for routine forensic use
- d) Bioinformatic complexity

Despite these limitations, NGS is emerging as the future standard in forensic genetics.

10.4 FORENSIC EPIGENETICS

Epigenetics introduces a new dimension into human identification by analysing chemical modifications of DNA that do not alter the sequence, such as methylation.

Potential applications:

- a) Differentiation between monozygotic twins
- b) Estimation of biological age
- c) Identification of tissue type
- d) Inference of environmental exposures

Unlike classic genetic markers, epigenetic patterns can vary between genetically identical individuals, which opens new possibilities in previously unsolvable cases.

Current limitations:

- a) Inter-individual variability
- b) Environmental influence
- c) Lack of standardisation
- d) Need for validation in forensic contexts

10.5 INTEGRATION OF BIG DATA AND BIOINFORMATICS

The exponential growth of genetic data has driven the development of advanced bioinformatic tools for their analysis.

Key components:

- a) Large-scale genetic databases
- b) Probabilistic analysis algorithms
- c) Simulation of kinship scenarios
- d) Automation of interpretation

The integration of big data will allow:

- a) Better estimation of allelic frequencies
- b) More precise population analysis
- c) Large-scale kinship evaluation

10.6 FUTURE PERSPECTIVES

The future of forensic genetics is oriented towards:

- a) Integrated multimodal approaches (STR + SNP + NGS + epigenetics)
- b) Automation through artificial intelligence
- c) Greater precision in complex scenarios
- d) Reduction of analysis times
- e) Expansion towards new applications (phenotyping, genetic genealogy)

Nevertheless, these advances must be accompanied by:

- a) Adequate ethical regulation
- b) Rigorous scientific validation
- c) Specialised training of professionals

Conclusion of the section

Emerging trends are transforming forensic genetics into a highly technological and interdisciplinary discipline. The integration of artificial intelligence, massively parallel sequencing, epigenetics and large-scale data analysis is significantly broadening the capacities of genetic identification. However, the main challenge lies in balancing technological innovation with scientific validation, methodological standardisation and respect for ethical and legal principles.

11 DETERMINATION OF PATERNITY AT THE PRENATAL LEVEL

11.1 INTRODUCTION

Prenatal paternity determination represents an advanced extension of forensic and clinical genetics, which allows biological filiation to be established before birth. This type of analysis has evolved from traditional invasive methods towards non-invasive approaches based on cell-free fetal DNA in maternal blood, significantly improving the safety and acceptability of the procedure.

11.2 BIOLOGICAL BASES OF FETAL DNA

During pregnancy, fragments of fetal DNA (mainly of placental origin) circulate freely in maternal plasma, known as cell-free fetal DNA (cffDNA).

Key characteristics:

- a) Detectable from week 5–7 of gestation
- b) Variable fetal fraction (generally 5–20%)
- c) Short half-life (rapid elimination postpartum)
- d) High fragmentation (~150–200 bp)

These properties allow its analysis by highly sensitive molecular techniques.

11.3 INVASIVE METHODS

Traditional methods involve the direct obtaining of fetal material:

a) Amniocentesis

- a) Performed between weeks 15–20
- b) Obtaining of amniotic fluid
- c) Risk of fetal loss: ~0.1–0.3%

b) Chorionic villus sampling (CVS)

- a) Performed between weeks 10–13
- b) Obtaining of placental tissue
- c) Slightly higher risk than amniocentesis

Application:

- a) They allow high-quality fetal DNA to be obtained
- b) Analysis by standard STR

Limitations:

- a) Clinical risk
- b) Ethical considerations
- c) Need for medical indication

11.4 NON-INVASIVE METHODS (NIPPT)

The most significant advance in prenatal paternity is the development of Non-Invasive Prenatal Paternity Testing (NIPPT).

Principle:

- a) Analysis of cell-free fetal DNA in maternal plasma
- b) Comparison with the DNA of the alleged father

Technologies used:

- a) Massively parallel sequencing (NGS)
- b) High-density SNP panels (thousands of markers)
- c) Advanced statistical models

Advantages:

- a) No risk for the fetus
- b) High sensitivity
- c) Applicable from early stages of pregnancy

Technical challenges:

- a) Low fetal fraction
- b) Mixture with maternal DNA
- c) Need for deconvolution algorithms
- d) High cost

11.5 ANALYTICAL AND STATISTICAL APPROACH

Prenatal analysis requires specific adaptations:

In STR:

- a) More complex interpretation due to maternal-fetal mixture
- b) Limited use in non-invasive methods

In SNP:

- a) Identification of paternal alleles not present in the mother
- b) Use of thousands of markers to increase statistical power

Probabilistic model:

Adapted Likelihood Ratios are used that consider:

- a) Fetal fraction
- b) Sequencing error
- c) Allelic distribution

11.6 LIMITATIONS AND SOURCES OF ERROR

Biological factors:

- a) Low fetal fraction (<4%)
- b) Placental mosaicism
- c) Multiple pregnancies

Technical factors:

- a) Sequencing errors
- b) Contamination
- c) Biases in amplification

Interpretative factors:

- a) Dependence on population databases
- b) Complexity of statistical models

11.7 SPECIFIC ETHICAL AND LEGAL CONSIDERATIONS

Prenatal paternity raises particular ethical challenges:

- a) Right of the fetus to protection
- b) Psychological impact on the mother
- c) Possible use in reproductive decisions
- d) Reinforced informed consent

The guidelines of the International Society for Forensic Genetics recommend:

- a) Prior ethical evaluation
- b) Careful communication of results
- c) Restriction of use to appropriate contexts

11.8 CLINICAL AND FORENSIC APPLICATIONS

- a) Determination of filiation in legal disputes
- b) Cases of sexual violence
- c) Complex family studies
- d) Early evaluation of kinship

11.9 FUTURE PERSPECTIVES

The field of prenatal paternity continues to evolve towards:

- a) Greater precision in NIPPT
- b) Integration with artificial intelligence
- c) Reduction of costs

d) Expansion of genetic panels

It is expected that these advances will consolidate non-invasive methods as the standard in the near future.

Conclusion of the section

Prenatal paternity determination represents a significant advance in applied genetics, allowing the evaluation of filiation with high levels of precision before birth. The transition towards non-invasive methods has improved safety and has broadened the clinical and forensic applications. However, its implementation requires a careful balance between technological innovation, scientific validation and ethical responsibility.

12 FINAL CONCLUSION

Paternity studies based on DNA analysis have evolved from methodologies of limited resolution towards highly sophisticated platforms that integrate multiplex STR systems, SNP markers and massively parallel sequencing technologies. This transition has consolidated forensic genetics as a tool of extraordinary precision and robustness for the determination of biological relationships, even in scenarios of high complexity.

In contemporary practice, paternity analysis transcends the simple comparison of genetic profiles and is based on a multidisciplinary approach that combines molecular biology, population genetics and Bayesian statistical models. This framework allows the strength of the evidence to be objectively quantified through likelihood ratios, guaranteeing reproducible and scientifically defensible results in the judicial sphere. The adoption of international standards promoted by bodies such as the Scientific Working Group on DNA Analysis Methods and the International Society for Forensic Genetics has been decisive in ensuring analytical quality and the correct interpretation of results.

The incorporation of emerging technologies, in particular next-generation sequencing, has substantially broadened the resolving capacity of genetic analysis, allowing intralocus variation to be characterised, multiple types of markers to be integrated and the interpretation in degraded samples or complex mixtures to be optimised. These advances have allowed classic limitations to be overcome, especially in contexts of collateral kinship, consanguinity or absence of one of the progenitors.

However, this technological progress also introduces relevant challenges, among them the need for global standardisation, the development of robust bioinformatic tools and the specialised training of professionals. Likewise, the adequate selection of population databases and the rigorous application of statistical models continue to be critical aspects to avoid biases in the probabilistic evaluation.

From an ethical and legal perspective, the application of these techniques requires responsible handling of genetic information, based on respect for confidentiality, informed consent and clear and precise communication of results. The correct interpretation of probabilistic language in the judicial sphere is essential to prevent errors and guarantee well-founded decisions.

Taken together, paternity studies through DNA constitute a paradigm of integration between science, technology and law. Their future development will be marked by the adoption of multimodal approaches, the incorporation of artificial intelligence and the analysis of large volumes of genetic data, which will allow even greater levels of precision, efficiency and reliability to be reached in the resolution of forensic cases.

ABSTRACT

This paper investigates the role of consensualism in Public Administration as an instrument for broadening access to justice in its effective dimension. It starts from the premise that access to justice is not limited to formal access to courts, but encompasses the achievement of adequate, timely, proportional and materially fair solutions to conflicts. To this end, it examines the relativisation of the principles of supremacy and unavailability of the public interest, distinguishing the unavailability of public interest from its alleged non-transactionability. The research adopts a deductive method, based on bibliographical review, normative analysis and recent institutional data from the National Council of Justice and the Federal Court of Accounts. The analysis covers four axes: the relativisation of the classical dogmas of administrative law; the normative and institutional consolidation of consensual Public Administration; the relationship between consensuality and effective access to justice; and the limits, risks and controls applicable to administrative agreements. The paper concludes that consensualism, when subject to legality, reasoning, transparency, control and protection of the primary public interest, constitutes a relevant instrument for litigation prevention, rationalisation of state action and realisation of a fair legal order.

Keywords: Access to Justice. Consensuality. Public Administration. Public Interest. External Control.

RESUMO

O presente trabalho investiga a função do consensualismo na Administração Pública como instrumento de ampliação do acesso à justiça em sua dimensão efetiva. Parte-se da premissa de que o acesso à justiça não se limita ao ingresso formal no Poder Judiciário, mas compreende a obtenção de soluções adequadas, tempestivas, proporcionais e materialmente justas para os conflitos. Para tanto, examina-se a relativização dos princípios da supremacia e da indisponibilidade do interesse público, distinguindo-se a indisponibilidade do interesse público de sua suposta intransacionabilidade. A pesquisa adota método dedutivo, com base em revisão bibliográfica, análise normativa e utilização de

RESUMEN

El presente trabajo investiga la función del consensualismo en la Administración Pública como instrumento de ampliación del acceso a la justicia en su dimensión efectiva. Se parte de la premisa de que el acceso a la justicia no se limita al ingreso formal en el Poder Judicial, sino que comprende la obtención de soluciones adecuadas, oportunas, proporcionales y materialmente justas para los conflictos. Para ello, se examina la relativización de los principios de la supremacía y de la indisponibilidad del interés público, distinguiéndose la indisponibilidad del interés público de su supuesta intransaccionabilidad. La investigación adopta el método deductivo, con base en revisión bibliográfica, análisis normativo y utilización de datos institucionales recientes del Consejo Nacional de Justicia y del Tribunal de Cuentas de la Unión. El análisis recorre cuatro ejes: la relativización de los dogmas clásicos del régimen jurídico-administrativo; la consolidación normativa e institucional de la Administración Pública consensual; la relación entre consensualidad y acceso efectivo a la justicia; y los límites, riesgos y controles aplicables a los acuerdos administrativos. Se concluye que el consensualismo, cuando se somete a criterios de juridicidad, motivación, transparencia, control y protección del interés público primario, constituye un instrumento relevante de prevención de litigios, racionalización de la actuación estatal y concreción de un orden jurídico justo.

1 INTRODUCTION

Brazilian Public Administration has historically been structured under the strong influence of a verticalised logic, founded on the prevalence of state power over the individual and supported by the principles of supremacy and unavailability of the public interest. This model, although it has played a relevant role in affirming administrative authority and protecting public assets, proves insufficient to respond, on its own, to the contemporary demands of efficiency, participation, transparency and effectiveness of fundamental rights.

The consolidation of the Democratic Rule of Law imposed on Public Administration the need to abandon an exclusively unilateral, imposing and bureaucratic action, opening space for more dialogical, cooperative and responsive practices. Contemporary Administration cannot be understood merely as an authority that orders, oversees and sanctions, but also as an instance that prevents conflicts, negotiates legally adequate solutions and promotes the concrete realisation of the public interest. In this sense, consensual Administration appears as one of the most relevant facets of the transformation of Administrative Law in the twenty-first century, linked to public governance, the network State and the democratisation of administrative decision-making (Oliveira; Schwanka, 2009).

The relevance of the theme becomes even more evident in view of the structural framework of litigiousness in Brazil. The report *Justiça em Números 2025*, base year 2024, released by the Conselho Nacional de Justiça, recorded the existence of 80.6 million pending cases at the end of 2024. The same report indicated that the congestion rate fell to 64.3%, the lowest index in the last 16 years, and that the stock of tax foreclosures decreased by 5.5 million actions in 2024. These data demonstrate that, although there is progress in judicial productivity, the broadening of access to justice cannot be understood merely as an expansion of the jurisdictional channel, but should include adequate mechanisms for the prevention, management and consensual resolution of conflicts (Conselho Nacional de Justiça, 2025).

Litigiousness involving the Public Power also takes on special relevance. In a statement recorded in the minutes of the Conselho Nacional de Justiça, minister Luís Roberto Barroso reported that the Instituto Nacional do Seguro Social was the largest litigant in the Brazilian justice system, involved in 4.5% of pending cases, followed by the Caixa Econômica Federal, with 2.86%. The same statement highlighted the recurrent presence of public entities among the largest litigants in the country, which reinforces the need for policies for the prevention and administrative resolution of conflicts involving the State (Conselho Nacional de Justiça, 2024).

In view of this scenario, the following research question is formulated: to what extent can consensualism in Public Administration function as an instrument for broadening effective access to justice, without violating the unavailability of the public interest?

The hypothesis adopted is that administrative consensuality, when correctly delimited by criteria of legality, reasoning, transparency, control and protection of the primary public interest, contributes to the reduction of litigiousness and to the delivery of faster, more efficient and more democratic solutions to conflicts involving the Public Power.

The general objective consists in analysing to what extent administrative consensualism can broaden effective access to justice. As specific objectives, it seeks to examine the relativisation of the classical dogmas of administrative law; to identify the consensual instruments incorporated into Brazilian positive law; to analyse the relationship between consensuality and effective access to justice; and to delimit the limits and controls applicable to administrative agreements.

The work is organised into five sections. After this introduction, the theoretical background presents the conceptual foundations of the research, articulating the relativisation of the supremacy and unavailability of the public interest, the theory of consensual Administration and the contemporary conception of access to justice. The methodology describes the procedures adopted for the bibliographical and documentary research. The results and discussion examine the normative and institutional instruments in the light of the theoretical framework, organising the findings into thematic axes. The final considerations resume the objectives, synthesise the results and point out perspectives for future research and regulation.

2 THEORETICAL BACKGROUND

Understanding administrative consensuality as an instrument of access to justice presupposes the articulation of a theoretical framework that runs, from the general to the specific, through the foundations of administrative law, the theory of consensual Administration and the contemporary conception of access to justice. The necessary starting point is the critical analysis of the principles of supremacy and unavailability of the public interest, traditionally conceived as foundations of administrative law, justifying special prerogatives of the Administration and limits on the action of public agents.

Beyond the principles expressly provided for in article 37 of the Constituição Federal — legality, impersonality, morality, publicity and efficiency —, classical doctrine recognises the existence of implicit principles that structure administrative action, among them the supremacy and unavailability of the public interest. Supremacy would authorise the

prevalence of the collective interest over individual interests in certain situations; unavailability, in turn, would prevent the administrator from treating public assets, rights and interests as if they were of his free ownership.

For Bandeira de Mello (2004), such principles constitute pillars of administrative law, insofar as they translate, on the one hand, the prerogatives necessary for the realisation of the public interest and, on the other, the subjections imposed on the administrator, who does not act in his own name, but in the name of the community. This understanding, however, came to be the object of revision by an important portion of contemporary doctrine.

Authors such as Ávila (1998), Justen Filho (2005) and Binenbojm (2010) reject the idea of an automatic, abstract and absolute prevalence of the public interest over the private interest. Ávila (1998) problematises the very configuration of the supremacy of the public interest as a principle, sustaining that the statement would lack the normative structure proper to norm-principles. Binenbojm (2010), in turn, defends the replacement of abstract supremacy with a duty of proportionality, so that the relationship between collective and private interests is resolved through constitutionally oriented weighting. Justen Filho (2005) also rejects the existence of a previously defined privileged state position, since the State is subject to the Constitution and to fundamental rights.

In a convergent sense, and from a complementary angle, Marques Neto (2015, p. 386) sustains that supremacy, by combining absoluteness and abstraction, is proper to the bipolar paradigm and stands as the antipode of the ideas of weighting, modulation and balancing, revealing itself, by presupposing an absolute relational notion, incompatible with the legal order itself (Marques Neto, 2015, p. 387). The same critique reaches the idea of a unitary public interest: it is an indeterminate, open and ductile notion, so that there is not one, but several public interests entangled in each provision of the Administration (Marques Neto, 2015, p. 388).

This revision is fundamental for the development of a consensual Public Administration. If the public interest is not an abstract formula monopolised by the State, but a constitutionally oriented construction, its realisation may occur by different means, including the consensual route. From such a perspective, consensus does not represent abdication of the public interest, but a possible technique for its realisation.

The distinction between primary and secondary public interest also proves relevant. The primary public interest corresponds to the realisation of the needs, rights and purposes of the community; the secondary one concerns the instrumental interests of the State itself, such as the preservation of the public treasury or of the administrative structure. The generic invocation of the supremacy of the public interest, without concrete identification of the

protected collective interest, may produce imbalances in the relations between Administration and citizen, limiting social participation and obscuring the public purpose of administrative action (Lima, 2025).

The unavailability of the public interest, in turn, cannot be confused with its absolute non-transactionability. The Administration does not freely dispose of the public interest, but may transact regarding the means of its realisation when the consensual solution proves more adequate, efficient and proportional than the litigious or imposing route. As Talamini (2005) observes, the unavailability of the public interest does not lead, in itself, to the impossibility of the Public Power submitting to others' claims or abdicating certain positions, provided it does so in a legally justified manner.

In a formulation that precedes the current debate, Moreira Neto (2003, p. 142) already described the passage from a vicious relationship of supremacy to a virtuous relationship of weighting, preventing reasons of State from being invoked to place any interests above fundamental rights. Based on the theory of the double degree, the author distinguished primary state power — absolute and non-negotiable — from secondary power, relative and negotiable, located in the plane of discretionary decisions (Moreira Neto, 2003, p. 139). It is in this key that the distinction adopted here is understood: in consensual action, there is never any consideration of negotiating the public interest, but of negotiating the ways of achieving it with greater efficiency (Moreira Neto, 2003, p. 154).

This understanding is reinforced by Dantas (2020), in sustaining that transaction in the Public Power should not be understood as an arbitrary renunciation of the collective interest, but as a technique of administrative efficiency and rationality, provided it is directed at the realisation of the primary public interest. The core of the problem, therefore, does not lie in knowing whether or not the Administration can compromise in the abstract, but in identifying about what, under which conditions, with which controls and with what purpose the administrative transaction may occur.

On this basis, consensual Public Administration is inserted in a broader movement of transformation of the State. The passage from a monological, authoritarian action centred on imposition to a dialogical, participatory and result-oriented action relates to the ideas of public governance, network State and contractualisation of administrative action.

On the theoretical plane, this transition finds a framework in the thesis of Marques Neto (2015, p. 404-406) on the overcoming of the bipolar paradigm — founded on the opposition between State and individual, public and private — by a relational and multipolar paradigm, associated with the notion of Public Arena. For the author, administrative activity does not dispense with cooperation with private parties, engaging with them not only in

relations of subordination, on the vertical axis, but in countless relations of cooperation and composition, on the horizontal axis, marked by consensuality and by the obligational bond (Marques Neto, 2015, p. 389). In this reading, public and private, previously held as separate worlds, present themselves as interpenetrated entities, so that the administrative decision comes to admit weighting and composition of interests (Marques Neto, 2015, p. 405-406).

Oliveira and Schwanka (2009) argue that consensual Administration constitutes a new face of Public Administration in the twenty-first century. For the authors, the contemporary State ceased to act only as holder of the power of empire and came to exercise, in various situations, functions of mediation, guarantee and composition of interests, including citizens and social groups in the process of densification of the public interest, which ceases to be an exclusive monopoly of the state authorities.

In the same direction, Medauar (2003) observes that the activity of consensus-negotiation between Public Power and private parties comes to play a relevant role in the identification of the public and private interests protected by the Administration. For the author, the Public Power ceases to hold exclusivity in the definition of the public interest, attenuates the practice of unilateral imposition of decisions and comes to assume a function of mediation in the composition of conflicts. Castro and Figueroa (2013), in turn, associate the evolution of consensualism with the need to distinguish the traditional bureaucratic model from a responsible public management, concerned with results and with the realisation of the principle of efficiency.

The dogmatic systematisation of this transition, in Brazil, dates back to Moreira Neto (2003, p. 146), who coined the notion of concerted administration to designate the organisational and functional modules characterised by consensual and negotiated activity, classifying it into three genres according to the function and the result sought: the consensual decision, the consensual execution and the consensual resolution of conflicts (Moreira Neto, 2003, p. 147). It was already then recognised that consensus improves governability, multiplies the checks against abuses and makes state commands more acceptable (Moreira Neto, 2003, p. 145).

The third theoretical axis is the contemporary conception of access to justice. Access to justice constitutes a fundamental right expressly guaranteed by article 5, item XXXV, of the Constituição Federal of 1988, according to which "the law shall not exclude from the appreciation of the Judiciary any injury or threat to a right" (Brasil, 1988). Although this provision enshrines the inafastability of jurisdiction, the contemporary understanding of access to justice cannot be reduced to the mere formal possibility of bringing a case to court:

it is a matter of guaranteeing adequate, effective, timely and materially fair means of prevention and resolution of conflicts.

This understanding can be deepened from the contractualist tradition. According to Bonilla Maldonado (2022), the constitution of the modern State represents the replacement of private revenge with institutionalised justice, since individuals accept limiting part of their freedom in exchange for protection, stability and legitimate resolution of conflicts. If the modern State legitimates itself, among other factors, by this replacement of private violence with institutional forms of conflict resolution, the realisation of justice may also occur through legally structured consensual mechanisms, and not only through judicial judgment.

The theory of the renewing waves of Cappelletti and Garth (1988) provides the decisive reference for this broadened understanding. The first wave relates to legal assistance to the underprivileged; the second, to the protection of diffuse and collective interests; and the third, to the reform of procedures and the valuing of adequate means of conflict resolution. Administrative consensuality is situated in this third movement, since it shifts the resolution of certain controversies from the exclusively judicial logic to more flexible, dialogical and efficient mechanisms, without removing the necessary legal control.

Finally, Abramovich and Courtis (2004), in analysing the enforceability of social rights, demonstrate that the jurisdictional protection of benefit-related rights faces particular challenges, since the mere judicial recognition of state non-compliance is not always sufficient to ensure the material realisation of the right. The effectiveness of justice, in these cases, requires mechanisms capable of transforming legal recognition into concrete, coordinated and enforceable measures, which reinforces the importance of consensual instruments apt to construct viable, controllable solutions compatible with the rights involved.

3 METHODOLOGY

This research adopts a qualitative approach, of a basic nature and exploratory and descriptive objectives, developed through bibliographical and documentary research. The choice of the qualitative approach is justified by the need to examine, in depth, the meanings attributed to administrative consensuality and to access to justice in doctrine, legislation and the institutional action of oversight bodies, a field in which the understanding of the normative and dogmatic aspects involved requires interpretative instruments that are not reduced to quantitative measurement.

The method of approach is deductive: it starts from the general premises of administrative law and of the theory of access to justice to examine the specific hypothesis that consensuality, when legally conditioned, broadens effective access to justice. As

research techniques, the bibliographical survey of national and foreign doctrine of Administrative Law, Procedural Law and the theory of access to justice was employed, as well as the documentary survey of normative and institutional sources.

The normative corpus brought together the Constituição Federal of 1988 and Laws n. 7.347/1985, 9.307/1996, 13.129/2015, 13.140/2015, 13.655/2018 and 14.133/2021, in addition to Resolution n. 125/2010 of the Conselho Nacional de Justiça. The documentary and institutional corpus comprised the report Justiça em Números 2025 and the minutes of the 2nd Extraordinary Session of 2024 of the Conselho Nacional de Justiça, the Recommendatory Note n. 02/2022 of Atricon, and the acts and institutional communication of the Tribunal de Contas da União on the Secretariat of External Control of Consensual Resolution and Conflict Prevention, in particular Normative Instructions TCU n. 91/2022 and n. 101/2025.

The selected material was subjected to qualitative content analysis, with the identification of thematic categories related to the objectives of the research, namely: (a) the relativisation of the supremacy and unavailability of the public interest; (b) the normative instruments of consensual Administration; (c) the relationship between consensuality and effective access to justice; (d) the risks of asymmetry in administrative agreements; and (e) the limits and controls of consensuality. The ethical aspects of the research were observed: all the sources consulted are cited and referenced in accordance with the ABNT norms, without undue appropriation of ideas or data; due to its bibliographical and documentary nature, the study did not involve the participation of human subjects, dispensing with submission to a Research Ethics Committee.

The main methodological limitation lies in the bibliographical and documentary nature of the corpus, which does not contemplate the empirical analysis of concrete administrative agreements nor the perceptions of public managers and private parties involved in composition processes. This limitation guides the suggestions for future research with empirical and participatory designs. Table 1 synthesises the main references mobilised and their contributions to the theoretical and analytical construction of the study.

Table 1

References and their contributions to the research

Author	Title	Year	Contribution to the research
Abramovich, V.; Courtis, C.	Los derechos sociales como derechos exigibles	2004	Highlights the limits of jurisdictional protection for the material realisation of benefit-related rights.

Ávila, H. B.	Repensando o "princípio da supremacia do interesse público sobre o particular"	1998	Questions the configuration of supremacy as a principle endowed with abstract and automatic prevalence.
Bandeira de Mello, C. A.	Curso de direito administrativo	2004	Systematises the supremacy and unavailability of the public interest as pillars of administrative law.
Binenbojm, G.	Da supremacia do interesse público ao dever de proporcionalidade	2010	Proposes replacing abstract supremacy with a constitutionally oriented duty of proportionality.
Bonilla Maldonado, D.	Acceso a la justicia y Estado moderno	2022	Relates access to justice to the rationality of the modern State and to the replacement of self-protection by institutionalised justice.
Cappelletti, M.; Garth, B.	Acesso à justiça	1988	Provides the theory of renewing waves and the notion of effective access to justice.
Castro, R. P. A. de; Figueroa, R. O.	Breve ensaio sobre o consensualismo na Administração Pública	2013	Associates consensualism with the overcoming of the bureaucratic model and with result-oriented public management.
Dantas, B.	Consensualismo, eficiência e pluralismo administrativo: a mediação pelo TCU	2020	Defends transaction and mediation in external control as techniques of administrative efficiency.
Fiss, O.	As bases políticas e sociais da adjudicação	2004	Warns about the risks of agreement as an instrument that may conceal asymmetries of power between the parties.
Galanter, M.	Why the "Haves" Come Out Ahead	1974	Contributes the theory of repeat players and the structural asymmetry between recurrent and occasional litigants.
Justen Filho, M.	Curso de direito administrativo	2005	Refutes the previously defined privileged state position, subjecting the State to the Constitution.
Lima, C. V. N. de	Breves considerações sobre a utilização do consensualismo na Administração Pública	2025	Discusses the distinction between primary and secondary public interest and the risks of the generic invocation of supremacy.

Marques Neto, F. A.	A bipolaridade do direito administrativo e sua superação	2015	Demonstrates the incompatibility of supremacy with weighting and proposes the overcoming of the bipolar paradigm.
Medauar, O.	O direito administrativo em evolução	2003	Identifies the activity of consensus-negotiation as a function of mediation in the composition of interests.
Moreira Neto, D. de F.	Novos institutos consensuais da ação administrativa	2003	Formulates the notion of concerted administration and the distinction between negotiating the public interest and the ways of achieving it.
Oliveira, G. J. de; Schwanka, C.	A administração consensual como a nova face da Administração Pública no século XXI	2009	Characterises consensual and mediating Administration as a central feature of contemporary Administrative Law.
Pereira, C. A. <i>et al.</i>	O consensualismo nos Tribunais de Contas: a nova onda de acesso à justiça	2025	Examines the consensual instruments in external control as a broadening of access to justice.
Talamini, E.	A (in)disponibilidade do interesse público	2005	Distinguishes the unavailability of the public interest from its alleged non-transactionability.

The organisation in alphabetical order facilitates the location of the sources and evidences the articulation between the dogmatic, normative and institutional dimensions that sustain the analysis developed in the following sections.

4 RESULTS AND DISCUSSION

The analysis of the bibliographical, normative and institutional material allowed the findings to be organised into five thematic axes, examined below in the light of the theoretical framework: the normative consolidation of consensual instruments; the relationship between consensuality and effective access to justice; the critique of agreements and the risk of asymmetry; the limits and controls of consensuality; and the institutional experience of the Courts of Accounts.

With regard to normative consolidation, it was found that the transformation described in the theoretical framework finds broad support in Brazilian positive law. Resolution n. 125/2010 of the Conselho Nacional de Justiça instituted the National Judiciary Policy for the adequate treatment of conflicts, strengthening the culture of conciliation and mediation. The

Code of Civil Procedure of 2015 enshrined self-composition as a guideline of the procedural system, by determining that conciliation, mediation and other methods of consensual resolution be stimulated by magistrates, lawyers, public defenders and members of the Public Prosecutor's Office.

In the specific field of Public Administration, Law n. 13.140/2015 provides for mediation and self-composition of conflicts within the scope of the Administration, foreseeing the creation of chambers for the prevention and administrative resolution of conflicts, competent to settle controversies between bodies and entities, evaluate requests for composition involving private parties and act in the prevention and resolution of conflicts relating to administrative contracts. Law n. 13.655/2018, in amending the Law of Introduction to the Norms of Brazilian Law, authorised, in article 26 of the LINDB, the conclusion of a commitment with interested parties to eliminate irregularity, legal uncertainty or contentious situation in the application of public law (Brasil, 2018).

Arbitration with Public Administration was expressly admitted by Law n. 13.129/2015, which amended Law n. 9.307/1996 to allow the direct and indirect Administration to use arbitration in conflicts relating to available patrimonial rights. Law n. 14.133/2021 consolidated this movement in the field of public procurement, authorising, in its articles 151 to 154, the use of conciliation, mediation, dispute resolution committee and arbitration in controversies over available patrimonial rights, such as economic-financial rebalancing, default of obligations and calculation of indemnities.

To these legislative instruments is added a set of already consolidated sectoral mechanisms, such as conduct adjustment terms, commitment terms in regulatory agencies, cessation commitments in the competition sphere, civil non-prosecution agreements, procedural legal transactions involving public entities and management adjustment terms before Courts of Accounts. The examination of this normative set evidences that consensual methods have ceased to occupy a peripheral or exceptional position, coming to integrate the ordinary institutional repertoire of Public Administration, especially in the areas in which unilateral imposition proves incapable of producing efficient, timely and sustainable solutions.

The second axis confirms the relationship between consensuality and effective access to justice. The figures of the report *Justiça em Números 2025*, already referred to in the introduction, evidence that access to justice cannot be thought of merely as a broadening of the Judiciary's entry door, but also as the creation of adequate doors for the prevention, management and resolution of conflicts (Conselho Nacional de Justiça, 2025). The litigiousness involving the Public Power aggravates this scenario, since public entities recurrently appear among the largest litigants in the country (Conselho Nacional de Justiça,

2024), which reveals that a significant part of the judicial overload stems from conflicts that could, in certain hypotheses, be prevented or resolved administratively.

From this perspective, consensual Public Administration can contribute to overcoming an adversarial culture marked by the automatic resistance of the State, by the standardised filing of appeals and by the delay in the administrative correction of illegal or inefficient conducts. Instead of litigating until the exhaustion of procedural channels, the Administration should evaluate, in a reasoned manner, when composition represents a more adequate solution to the primary public interest, to the rights of private parties and to administrative efficiency itself.

The third axis problematises the critique of agreements and the risk of asymmetry, avoiding an excessively optimistic understanding of consensuality. Fiss (2004) warns that judicial adjudication has a relevant public function, especially when it involves the affirmation of constitutional values, the correction of structural inequalities and the production of decisions with public impact. Although agreement is usually presented as a technique of pacification and efficiency, it may conceal material inequalities between the parties, especially when one of them has greater economic, institutional or informational power, a hypothesis in which the consensual solution does not express true autonomy, but constrained acceptance of conditions imposed by the stronger party (Fiss, 2004).

Within the scope of Public Administration, this warning is especially important. The State has a technical structure, a specialised legal body, accumulated information and institutional capacity to prolong litigation, which may place it in a position of advantage in relation to the private party, possibly in a situation of economic, technical or informational vulnerability. The theory of repeat players, associated with Galanter (1974), reinforces this diagnosis: public entities and large organisations tend to act repeatedly in conflicts, accumulating strategic experience, data and technical resources, which may produce institutional advantages in relation to occasional litigants. Thus, in concluding agreements with private parties, the Administration must ensure that the consensus does not reproduce, in an apparently cooperative form, the same verticality that is intended to be overcome.

Even so, when correctly structured, administrative consensus reinforces the democratic dimension of access to justice, since it allows the solution to be constructed with the participation of the interested parties, reduces costs, decreases response time, preserves continued relationships and favours the concrete implementation of public policies. Consensuality then ceases to be merely a technique of procedural management and comes to integrate a substantial conception of administrative justice.

The fourth axis delimits the limits and controls of consensuality, understood as a legally conditioned technique. The first limit is the transactionability of the object: the Administration cannot dispose of the essence of the primary public interest nor compromise on absolutely unavailable rights, while negotiation on the means of fulfilling obligations, deadlines, forms of execution, technical criteria, restoration of economic-financial balance, indemnities and other available patrimonial or instrumental aspects is admitted.

The second limit is reasoning: every administrative agreement must demonstrate, clearly, why the consensual solution is more adequate than the continuation of litigation or unilateral imposition, making explicit the public advantage, the risks avoided, the comparative costs and the compatibility with the applicable legislation. The third limit is transparency: as a rule, agreements must be public, except for the legal hypotheses of secrecy, since publicity allows social control, reduces risks of capture and strengthens the democratic legitimacy of the decision. The fourth limit is internal and external control, which is not removed by consensuality; on the contrary, the greater the complexity and repercussion of the agreement, the greater the degree of control over its legality, advantageousness and adherence to the public interest must be.

The fifth axis examines the institutional experience of the Courts of Accounts, which illustrates the viability of the proposed controls. Pereira *et al.* (2025) argue that instruments such as Management Adjustment Terms and Technical Tables express a paradigm shift in external control, which ceases to act only in a subsequent, repressive and sanctioning manner, coming to exercise a preventive, guiding and collaborative function, and contributing to broaden access to justice beyond the Judiciary. In the same sense, Atricon recommended that the Courts of Accounts adopt instruments of consensual conflict resolution in external control processes, observing administrative law (Atricon, 2022).

At the federal level, the experience of the Tribunal de Contas da União stands out. Since the beginning of 2023, the TCU has come to dedicate itself institutionally to the promotion of consensual solutions and the prevention of conflicts, through the Secretariat of External Control of Consensual Resolution and Conflict Prevention, based on Normative Instruction TCU n. 91/2022, subsequently amended by Normative Instruction TCU n. 101/2025. According to the Court itself, the normative update of 2025 broadened transparency, social participation, the criteria of admissibility and the flow of the processes, reflecting the experience accumulated in the treatment of controversies, with more than fifty cases in the unit, of which more than half had already been resolved (Tribunal de Contas da União, 2025).

This action dialogues with the proposal of Dantas (2020), who defends the adoption of mediation in the Tribunal de Contas da União as a mechanism apt to reduce the distance between manager and controller, especially in controversies relating to infrastructure contracts and economic-financial rebalancing. The set of these findings allows us to affirm that administrative consensuality must operate under a double key: openness to dialogue and submission to robust controls. Without dialogue, the Administration remains trapped in authoritarian rigidity and in litigiousness; without control, consensus may degenerate into favouritism, opacity or undue renunciation of the collective interest. The valid administrative agreement is, therefore, that which demonstrates, in a verifiable manner, its legality, its public advantage, its proportionality, its transparency and its compatibility with the fundamental rights involved.

5 FINAL CONSIDERATIONS

This article analysed consensualism in Public Administration as a tool for broadening access to justice in its effective dimension. The investigation started from the finding that the Brazilian Administration, historically founded on verticalised relations and unilateral prerogatives, has been progressively challenged by demands for efficiency, participation, governance, transparency and adequate resolution of conflicts.

The first conclusion is that the principles of supremacy and unavailability of the public interest can no longer be understood as absolute dogmas. Supremacy does not authorise the automatic prevalence of the State over the private party; unavailability does not amount to a prohibition of any transaction. What is forbidden is the undue renunciation of the primary public interest, not the legitimate negotiation of the most adequate means to realise it.

The second conclusion is that administrative consensuality is already incorporated into Brazilian positive law. The Mediation Law, the Code of Civil Procedure of 2015, the Arbitration Law, article 26 of the LINDB and Law n. 14.133/2021 demonstrate that self-composition has ceased to be an exceptional mechanism and has come to integrate the ordinary structure of prevention and resolution of conflicts involving Public Administration.

The third conclusion is that consensualism can broaden access to justice because it shifts attention from the mere entry into the Judiciary to the obtaining of effective, timely and adequate solutions. The data of the Conselho Nacional de Justiça demonstrate that the Brazilian judicial overload remains significant, despite the recent advances in productivity, and the repeated presence of public entities among the large litigants reinforces the need for a less adversarial Administration more committed to the prevention of conflicts.

The fourth conclusion is that the experience of the Courts of Accounts, especially of the TCU, reveals a promising institutional dimension of administrative consensuality. The creation of a unit dedicated to consensual resolution, the issuance of Normative Instruction TCU n. 91/2022 and its amendment by Normative Instruction TCU n. 101/2025 demonstrate that external control can act not only in a repressive manner, but also in a preventive, dialogical manner oriented towards the construction of legally secure solutions.

The fifth conclusion is that consensualism should not be treated as a panacea, since it presents risks, especially in contexts of informational asymmetry, vulnerability of the private party, administrative capture or decisional opacity. Fiss's critique of agreements and Galanter's theory of repeat players demonstrate that consensuality will only be legitimate when accompanied by procedural guarantees, reasoning, publicity and control.

The limitations of the study, of a bibliographical and documentary nature, are recognised, as it does not contemplate the empirical analysis of concrete agreements nor the perceptions of managers and private parties; for future research, empirical designs and comparative studies of regulatory models are suggested. In this way, administrative consensus, when correctly structured, does not represent a flight from Public Law, but a democratic updating of Administrative Law, allowing Public Administration to cease being merely a recurrent party in litigation and to act as an agent of prevention, composition and effective realisation of justice.

ABSTRACT

Patient safety is a strategic priority for health systems, and the classification of the level of harm is essential information for gauging the consequences of incidents, guiding institutional prioritisation, and supporting data comparability. In Brazil, the "degree of harm" field of the Health Surveillance Notification System (Notivisa), aligned with the International Classification for Patient Safety (ICPS), uses broad descriptors and does not structurally differentiate physical from psychological harm, which may increase interpretive variability among professionals and limit the comparability of the information. The levels-of-harm classification of NHS England, the body responsible for coordinating the National Health Service (NHS) in England, is part of the Learn from Patient Safety Events Service (LFPSE), distinguishes the categories of physical and psychological harm, and adopts descriptors and decision criteria potentially useful for the Brazilian context. This manuscript presents the protocol of a prospective methodological study aimed at developing, in Brazilian Portuguese and within the Brazilian Unified Health System (SUS), an adapted and validated version of the classification of levels of harm associated with patient safety events published by NHS England. The study will be conducted in sequential stages: initial translations, synthesis of the translations, back-translations, committee review of the translated document, normative and organisational contextualisation to the SUS, content validation using the Delphi method, and face validation with professionals who may use the classification in their institutional practice. There will be no direct patient involvement. The study is expected to produce a version conceptually equivalent to the source material and compatible with the normative and organisational context of the SUS, preserving the structure of harm categories, levels of harm, level descriptors, and decision criteria, and contributing to greater precision, standardisation,

RESUMO

A segurança do paciente constitui prioridade estratégica dos sistemas de saúde, e a classificação do nível de dano é informação essencial para dimensionar as consequências dos incidentes, orientar a priorização institucional e favorecer a comparabilidade dos dados. No Brasil, o campo “grau do dano” do Sistema de Notificações para a Vigilância Sanitária (Notivisa), alinhado à Classificação Internacional para a Segurança do Paciente (CISP), utiliza descritores amplos e não diferencia, de forma estruturada, dano físico e dano psicológico, o que pode ampliar a variabilidade interpretativa entre profissionais e limitar a comparabilidade das informações. A classificação dos níveis de dano do NHS England, órgão responsável pela coordenação do Serviço Nacional de Saúde (National Health Service, NHS) na Inglaterra, integra o Learn from Patient Safety Events Service (LFPSE), distingue as categorias de dano físico e psicológico e adota descritores e critérios de decisão potencialmente úteis ao contexto brasileiro. Este manuscrito apresenta o protocolo de um estudo metodológico prospectivo para o desenvolvimento, em português brasileiro e no contexto do Sistema Único de Saúde (SUS), de uma versão adaptada e validada da classificação dos níveis de dano associados a eventos de segurança do paciente publicada pelo NHS England. O estudo será conduzido em etapas sequenciais: traduções iniciais, síntese das traduções, retrotraduções, revisão, por comitê, do documento traduzido, contextualização normativa e organizacional ao SUS, validação de conteúdo por método Delphi e validação de face com profissionais que poderão utilizar a classificação em sua prática institucional. Não haverá participação direta de pacientes. Espera-se produzir uma versão conceitualmente equivalente ao material de origem e compatível com o contexto normativo e organizacional do SUS, preservando a estrutura de categorias de dano, níveis de dano, descritores dos níveis e critérios de decisão, e contribuindo para maior precisão, padronização e comparabilidade das informações sobre dano e para respostas institucionais a incidentes de segurança do paciente mais proporcionais, transparentes e orientadas à aprendizagem.

1 INTRODUCTION

Patient safety constitutes a strategic priority for health systems, given the magnitude of preventable harm associated with care and its impact on the population's trust in health institutions (Panagioti *et al.*, 2019). This agenda was reinforced by the Global Action Plan for Patient Safety 2021-2030 of the World Health Organization (WHO), which directs governments and health organisations towards the elimination of preventable harm and the incorporation of safety as a dimension inseparable from the quality of care (World Health Organization, 2021).

The recording of the incident, however, is only the first step of the institutional response. Notification systems for learning depend on structured information, on the identification of patterns, and on the analysis of the elements that make up work processes and of the people who operate within them, so as to sustain improvement actions proportionate to the risk and impact of the incidents (Goekcimen *et al.*, 2022; McDonald *et al.*, 2010). Within this process, the classification of the level of harm to the patient is critical information: it gauges the effect of the incident, supports institutional prioritisation, guides communication, and sustains the comparability of data over time (Cooper *et al.*, 2018).

This function is inscribed within the classical logic of risk management. The international standard ISO 31000:2018 structures this process into stages of identification, analysis, evaluation, treatment, monitoring, and communication, an approach equally applicable to health organisations to ground decisions guided by consequences, priorities, and control measures (International Organization for Standardization, 2018).

In Brazil, the "degree of harm" field of the Health Surveillance Notification System (Notivisa), the national base for recording adverse events of the Brazilian Health Regulatory Agency (Anvisa), classifies the harm resulting from the patient safety incident into five levels (none, mild, moderate, severe, and death), in accordance with the International Classification for Patient Safety (ICPS) (Agência Nacional de Vigilância Sanitária, 2025). Developed by the WHO, the ICPS sought to address the absence of a common language in the field, harmonising concepts, terms, and definitions that favour the description, measurement, monitoring, and comparison of information on incidents between different services and health systems (World Health Organization, 2010).

Despite its relevance as a national reference, this field presents broad and succinct descriptors for the levels of harm, without making explicit decision criteria that are sufficiently operational to guide classification in the routine of services. Some descriptors resort to semantically broad expressions that are difficult to delimit, such as "short duration" and "long term", which may favour variable interpretations among professionals and compromise the

standardisation of the record. Added to this is the absence of structured differentiation between the categories of physical and psychological harm, which reduces analytical precision, increases interpretive variability, and compromises the comparability of data (Goekcimen *et al.*, 2022; Cooper *et al.*, 2018; Agência Nacional de Vigilância Sanitária, 2025).

The Global Patient Safety Report 2024, the first WHO report to present a comprehensive overview of the implementation of patient safety worldwide, aligned with the Global Action Plan for Patient Safety 2021-2030, adopts a multidimensional understanding of harm: in addition to physical harm, which may reach death or permanent disability, it considers the population scale of the problem and its economic, social, and psychological effects, and argues that policies, measurement, and institutional responses should contemplate this entire spectrum, and not only the immediate physical injury (World Health Organization, 2024).

The literature on the repercussions of adverse events on patients and family members confirms the understanding of harm proposed by the WHO, which contemplates different dimensions, by identifying physical, psychological, social, and financial impacts. Psychological harm is one of the most frequent and persistent dimensions, although it is still poorly recognised in institutional responses. It may manifest as anger, fear, guilt, grief, post-traumatic stress disorder (PTSD), and, in extreme cases, suicidal ideation, with effects that may last a decade or more. The way the institution responds to the event directly influences the intensity of this suffering, reinforcing the importance of empathetic communication, transparency, and continued psychological support following patient safety incidents (Ottosen *et al.*, 2021). In Brazil, the notification and classification instruments still concentrate predominantly on physical harm, which reinforces the need for a classification capable of recognising and measuring psychological harm as well.

In NHS England, the body responsible for coordinating the National Health Service (NHS) in England, a public service with universal coverage—a characteristic that converges with the structuring principles of the Brazilian Unified Health System (SUS)—the classification of levels of harm is part of the Learn from Patient Safety Events Service (LFPSE), a national platform for recording and learning from patient safety events (Weaver; Stewart; Kay, 2021; NHS England, 2023). The LFPSE replaced the National Reporting and Learning System (NRLS), the national repository of incident notifications in force since 2003, in the context of a broader reorganisation of patient safety in the country, driven by criticisms of the quality of investigations, the limited capacity to promote organisational learning, and the fragmentation of institutional responses within the NHS (Weaver; Stewart; Kay, 2021; Oikonomou *et al.*, 2019; Mesinioti *et al.*, 2025).

In comparison with the NRLS, the LFPSE strengthens an approach oriented towards learning and continuous improvement by incorporating more objective descriptors and decision criteria for the classification of levels of harm and by encouraging not only the recording of patient safety events but also of successful responses and improvements implemented from these events. Among its advances, the distinction between the categories of physical harm and psychological harm stands out, which confers greater precision to the characterisation of the consequences of patient safety incidents (NHS England, 2023).

This reorganisation of the NHS had as a structuring change the implementation of the Patient Safety Incident Response Framework (PSIRF), a national framework for responding to patient safety incidents that replaced the Serious Incident Framework (SIF), the previous model centred on the mandatory investigation of serious incidents. The PSIRF redefined the way the NHS guides the institutional response to incidents, coming to favour responses proportionate to the impact of the incident, the potential for learning, and the possibility of reducing future risks, rather than taking the severity of harm as the sole criterion for defining the conduct of the response. In this new arrangement, responses to incidents should involve the people affected, adopt a socio-technical analysis of the work system and the interactions between its components, promote qualified oversight of improvement actions, and translate the findings into timely redesign of processes (NHS England, 2022; Louch *et al.*, 2025; Iacobucci, 2019; Hallam, 2023).

The change was also accompanied by legislative and institutional initiatives. The Healthcare Safety Investigation Branch (HSIB), created in 2017 for the independent and systemic investigation of patient safety incidents (Dyer, 2017; Macrae, 2019; Crompton *et al.*, 2025), was subsequently converted into the Health Services Safety Investigations Body (HSSIB), a statutory body established by the Health and Care Act 2022 (Mayberry; Farrukh, 2026).

In Brazil, this debate gains momentum in light of recent milestones that reposition the patient and their safety at the centre of SUS decisions. Lei nº 15.378, de 6 de abril de 2026, which established the Estatuto dos Direitos do Paciente, recognises safety as a right and strengthens the participation of the patient in decisions and practices related to safe care (Brasil, 2026a). In a convergent manner, Portaria GM/MS nº 11.527, de 9 de junho de 2026, established the National Policy for Quality and Patient Safety (PNQSP) within the scope of the SUS, with the purpose of promoting safe, equitable, and person-centred care, as dimensions of the quality of health care, organised in an integral and territorialised manner and oriented towards the Health Care Networks (RAS) (Brasil, 2026b). In continuity with the National Patient Safety Programme (PNSP), established in 2013 (Brasil, 2013), these

milestones reinforce the need to qualify the information produced in notification, monitoring, and learning systems, including clearer and more consistent instruments to define the harm resulting from patient safety incidents.

The SUS is used directly by approximately 76% of the Brazilian population, accounts for around 2.8 billion appointments annually, and mobilises approximately 3.5 million professionals across multiple levels of care and care contexts (Castro *et al.*, 2019). On this scale, patient safety assumes a strategic character, and preventable harm acquires an expressive collective dimension, both due to the volume of people served and the role of the SUS as the only means of access to health for a significant portion of the population. Its repercussions fall on the continuity of care, operational efficiency, sustainability in the use of public resources, and social trust in the system (Kumah, 2025). National evidence gauges this effect: in a retrospective study conducted in Brazilian public hospitals, 65.7% of adverse events resulted in prolonged hospitalisation, a situation that exposes patients to additional risks, restricts the availability of beds, and compromises the access of other RAS users (Mendes *et al.*, 2018; Lima Júnior *et al.*, 2023).

It is in this scenario that the qualification of the classification of levels of harm assumes strategic value. The adoption of well-delimited harm categories, consistent levels of harm, clearer descriptors, and more objective decision criteria may standardise the information produced, support the identification of priorities and the definition of proportionate responses, in addition to promoting a more homogeneous understanding of the consequences of incidents among professionals from different services and regions. In a system of such breadth and care diversity, as is the SUS, the quality of these data sustains more equitable and transparent decisions and strengthens health management and surveillance (Goldman *et al.*, 2026).

Adopting a classification already consolidated in another system is a frequent strategy for this improvement; its transposition, however, cannot dispense with methodological rigour. Mere translation, even if reviewed by specialists, does not replace a formal process of cross-cultural adaptation and validation, which seeks to preserve the equivalence between the original and adapted versions in their semantic, idiomatic, experiential, and conceptual dimensions, in addition to contributing to content and face validity in the new context of application (Guillemin; Bombardier; Beaton, 1993; Beaton *et al.*, 2000; Alavi; Le Lagadec; Cleary, 2026).

In view of this scenario, this manuscript presents the protocol of a methodological study, of a prospective nature, aimed at conducting the translation, cross-cultural adaptation, and validation, into Brazilian Portuguese, of the classification of levels of harm associated

with patient safety events published by NHS England, with the objective of making available a version conceptually equivalent to the original and compatible with the normative and organisational context of the SUS. By structurally stratifying both physical and psychological harm, it is expected that this version will qualify the information produced in notification systems, favouring monitoring and learning and sustaining more proportionate and transparent responses to patient safety incidents in the SUS.

2 METHOD

2.1 STUDY DESIGN AND REPORTING REFERENCES

This is a protocol of a methodological study of a prospective nature, intended for the translation, cross-cultural adaptation, and validation, into Brazilian Portuguese, of the classification of levels of harm associated with patient safety events published by NHS England. The objective is to produce a version conceptually equivalent to the source material (Herdman; Fox-Rushby; Badia, 1998) and, simultaneously, compatible with the normative, organisational, and operational context of the SUS, so as to support institutional processes of notification, analysis, and monitoring of the response to patient safety incidents. The development will follow sequential and interdependent stages: initial translations, synthesis of the translations, back-translations, committee review of the translated document, normative and organisational contextualisation to the SUS, content validation using the Delphi method, and face validation with professionals who may use the classification in their institutional practice. There will be no inclusion of patients, collection of individualised clinical data, or implementation of care interventions.

The translation and adaptation process will adopt as a central reference the stages proposed by Beaton *et al.* (2000), complemented by the good practice principles of the International Society for Pharmacoeconomics and Outcomes Research (ISPOR) for translation and cross-cultural adaptation (Wild *et al.*, 2005) and by the guidelines of Sousa and Rojjanasrirat (2011). The generation and interpretation of validity evidence are guided by the framework of sources of validity evidence of the Standards for Educational and Psychological Testing (American Educational Research Association; American Psychological Association; National Council on Measurement in Education, 2014) and by the recommendations of the COnsensus-based Standards for the selection of health Measurement INstruments (COSMIN) initiative, used in the pertinent aspects as support for the organisation of content validity evidence, considering that the object does not constitute a psychometric instrument nor produces a score (Terwee *et al.*, 2018). The reporting of the Delphi rounds will follow the Guidance on Conducting and Reporting Delphi Studies

(CREDES) (Jünger *et al.*, 2017). The protocol will be registered on the Open Science Framework (OSF), a platform maintained by the Center for Open Science (Center for Open Science, [s.d.]), prior to the start of data collection, providing transparency, dating, and reproducibility.

2.2 METHODOLOGICAL FOUNDATION

The translation and cross-cultural adaptation will seek to preserve the semantic, idiomatic, experiential, and conceptual equivalences between the source classification and the adapted version (Herdman; Fox-Rushby; Badia, 1998; Beaton *et al.*, 2000). Semantic equivalence will assess whether terms and statements preserve the meaning attributed in the source material; idiomatic equivalence will examine whether expressions characteristic of the English language have been rendered in a natural and comprehensible manner in Brazilian Portuguese; experiential equivalence will analyse whether the situations, practices, and criteria described are recognisable and applicable to Brazilian health services; and conceptual equivalence will verify whether the central concepts of the classification, especially those related to the categories of physical and psychological harm and the respective levels of harm, maintain their meaning in the normative, organisational, and care context of the SUS.

Considering that the object does not consist of a psychometric scale or self-report instrument, but rather an operational classification composed of harm categories, levels of harm, level descriptors, and decision criteria that do not produce numerical scores, the adaptation reference will be applied with adjustments to the nature of the object (Ye *et al.*, 2026; NHS England, 2023). The emphasis will fall on validity evidence based on content and on response processes, as well as on conceptual and normative consistency, with no analyses being carried out based on internal structure or relations with other variables, nor estimates of reliability through internal consistency, characteristic of psychometric instruments with a score. As a result of this nature, two stages of the reference of Beaton *et al.* (2000) will be adapted. The pre-test stage, originally conducted with patients, will be operationalised as face validation with professionals who may use the classification in their institutional practice, producing evidence related to comprehension, interpretability, and applicability of the criteria. The expert committee review stage provided for by Beaton *et al.* (2000) will be maintained according to the methodological reference, with the purpose of consolidating the translated material into a consensus version (section 2.7.4). Subsequently, the normative and organisational contextualisation to the SUS will be carried out, from which the pre-final version to be submitted for validation will result (section 2.7.5). In the absence

of a developer of the original instrument to whom to submit the final reports, the auditability of the process will be ensured by the systematic recording of decisions at all stages (Beaton *et al.*, 2000; Polit; Beck, 2006; Polit; Beck; Owen, 2007).

The conceptual and experiential equivalences, in this object, have a nature distinct from that observed in instruments whose items describe individual experiences. As the decision criteria refer to types of care, temporal parameters, levels of care intervention, and recording conditions regulated in a specific manner in each country, verifying whether these concepts maintain meaning and applicability in the SUS requires examining, in a systematic manner, the correspondence between the criteria of the source classification and the Brazilian normative, sanitary, and organisational framework, including the terminology adopted within the scope of the PNSP and the organisation of the incident response processes recommended by Anvisa. This examination constitutes the stage of normative and organisational contextualisation to the SUS and is, therefore, the procedure by which the conceptual and experiential equivalences are established in this study, and not an additional stage to the cross-cultural adaptation. By making explicit, systematic, and auditable a verification that, in strictly linguistic adaptations, would remain implicit, the contextualisation also constitutes the main methodological differential of this protocol. Its operationalisation, by means of a matrix of normative and conceptual correspondence, is detailed in section 2.7.5.

Content validation will be conducted using the Delphi method, with structured, anonymised, and iterative judgement by specialists, in accordance with Hasson, Keeney, and McKenna (2000), and estimated by the Item-level Content Validity Index (I-CVI), by the Scale-level Content Validity Index based on the average of the items (S-CVI/Ave), and by the modified kappa, according to Polit, Beck, and Owen (2007). Face validity will be examined based on evidence related to the response process of the professionals who may use the classification in their institutional practice: clarity, comprehensibility, organisation, interpretability, and usability, with calculation of the Item-level Face Validity Index (I-FVI) and the Scale-level Face Validity Index based on the average of the items (S-FVI/Ave), according to Yusoff (2019). Content and face validity will be interpreted in an integrated manner, articulating quantitative results, qualitative justifications, and evidence of normative and conceptual coherence, so as to maximise the robustness of the evidence and the reproducibility of the process (Sousa; Rojjanasrirat, 2011; Terwee *et al.*, 2018).

2.3 ORIGINAL DOCUMENT AND MATERIAL TO BE ADAPTED

The original material will be extracted from the section Definitions: harm grading of the electronic document Policy guidance on recording patient safety events and levels of harm,

published by NHS England under the reference PRN00444, on 15 August 2023, in the version updated on 16 March 2026, adopted as a reference in this study, with recording of the date of access and the electronic address for traceability purposes. The document constitutes technical-institutional guidance for the recording of patient safety events in the LFPSE and is made available under the Open Government Licence v3.0, which permits reuse, translation, and adaptation upon attribution of the original source (NHS England, 2023). In this study, the object of the adaptation is restricted to the classification of levels of physical and psychological harm presented in this section. Subsequent updates will only be incorporated upon specific and documented methodological deliberation.

For the purposes of this study, the classification will be understood from four structural components present in the source document. The first is the harm category, which indicates the type of harm to be recorded, physical or psychological. The second is the level of harm, which expresses the gradation of severity within each category. The third is the level descriptor, corresponding to the statement that characterises the general meaning of that level. The fourth is the decision criterion, understood as the operational condition that guides the framing of the harm at a given level.

The LFPSE replaces the single gradation previously used in the NRLS with a classification organised into two categories, physical and psychological, as synthesised in Table 1. The psychological harm category does not contemplate a level corresponding to the fatal outcome. The terms in Portuguese presented in this section and in Table 1 derive from one of the initial translations of the source document and are of a provisional nature, and may be modified in subsequent stages (Guillemin; Bombardier; Beaton, 1993; Beaton *et al.*, 2000; Alavi; Le Lagadec; Cleary, 2026).

Table 1

Comparison between the previous NRLS gradation and the levels of physical and psychological harm of the LFPSE

PREVIOUS GRADATION (NRLS / SINGLE MEASURE)	LEVELS OF PHYSICAL HARM (LFPSE)	LEVELS OF PSYCHOLOGICAL HARM (LFPSE)
No harm	No physical harm	No psychological harm
Low harm	Low physical harm	Low psychological harm
Moderate harm	Moderate physical harm	Moderate psychological harm
Severe harm	Severe physical harm	Severe psychological harm
Death	Fatal	Not applicable

Source: adapted from the section Definitions: harm grading of the electronic document Policy guidance on recording patient safety events and levels of harm, NHS England, published in 2023 and updated in March 2026.

The source document directs that the classification of the level of harm represent the effectively observed impact of the incident on the patient, based on the best information available at the time of recording. Thus, the classification should not be based on speculation about more serious potential harm, although it may be revised when new information becomes available. The attribution of the level of harm involves professional judgement and, whenever possible, should consider the perspective of the affected patient (NHS England, 2023).

In the physical harm category, the LFPSE organises the levels into no physical harm, low physical harm, moderate physical harm, severe physical harm, and fatal. The level descriptors are accompanied by decision criteria that consider, among other elements, the need for observation or minor treatment, the need for and duration of additional care, prolongation of hospitalisation, the need for immediate clinical intervention for preservation of life, impact on functional independence, repercussion on pre-existing conditions, permanence of the harm, probable reduction of life expectancy, and possible contribution of the incident to death. The low physical harm level has a cumulative logic, requiring the fulfilment of all the criteria defined for this level; the moderate and severe levels are attributed by the presence of at least one of the criteria specific to each level, which exceed, respectively, the limits defined for the immediately lower level; and the fatal level is applicable when, at the time of recording, the patient has died and the incident may have contributed to death, including pregnancy loss or stillbirth (NHS England, 2023).

In the psychological harm category, the LFPSE organises the levels into no psychological harm, low psychological harm, moderate psychological harm, and severe psychological harm, without a level corresponding to the fatal outcome. The source document makes explicit that the recording of psychological harm does not require a formal diagnosis nor assessment by a professional specialised in mental health, since the initial selection of the level of harm should reflect the information available at the time of recording and the judgement of the professional responsible for the record, and may be revised when new information becomes available. The level descriptors are accompanied by decision criteria that consider psychological distress, the need for and probable duration of treatment, repercussion on usual activities, impairment of independent living, new mental health diagnosis or significant worsening of a pre-existing condition, and expectation of recovery. Unlike low physical harm, the levels of low, moderate, and severe psychological harm are defined by the presence of at least one criterion specific to each level. The gradation between the levels occurs mainly through the intensity and expected duration of the repercussions: psychological harm of shorter duration and without persistent functional repercussion tends

to be framed within the low level; harm with the need for treatment or functional impact of less than six months guides classification as moderate; and harm with treatment, functional repercussion, or absence of expected recovery beyond six months guides classification as severe (NHS England, 2023).

The separation between physical and psychological harm is a structuring component of the material to be adapted. By recognising psychological outcomes as a category proper to the consequence of incidents, the classification expands the capacity for characterising harm and aligns with the literature that advocates its incorporation into systems of notification, classification, and learning from patient safety incidents (Pfeiffer *et al.*, 2025).

2.4 SETTING AND TARGET SYSTEM

The target health system will be the SUS, a public system that is decentralised, regionalised, and guided by the principles of universality, integrality, and equity (Paim *et al.*, 2011; Massuda *et al.*, 2023). The adaptation will seek to render compatible the classification originally developed in NHS England with the normative, terminological, and organisational context of the SUS, considering the heterogeneity of the RAS, the PNQSP, the PNSP, and the Notivisa. The study will be conducted remotely, with the participants of the adaptation and validation stages acting from different Brazilian regions, without ties to a specific health service.

2.5 CONSIDERATION OF THE PERSPECTIVE OF PATIENTS AND FAMILY MEMBERS

Although patients and family members do not participate in the stages of this study, the patient safety system in force in NHS England, including the PSIRF and the LFPSE, recommends their participation in the response to patient safety incidents. In coherence with this principle, and in addition to the publication directed at the scientific community, a synthesis of the results will be prepared in accessible language, intended for SUS users, including patients and family members, and for other interested parties, with the objective of favouring understanding about the study and its findings and of providing transparency to the process of adapting the classification to the SUS context.

2.6 PARTICIPANTS AND SELECTION CRITERIA

The participants will be defined by methodological stage and will include translators, back-translators, members of the committee for the review of the translated document, specialists for the content validation, and professionals for the face validation. The research team will be responsible for the methodological and operational conduct, comprising the

organisation of the source material, the preparation of the instruments, the coordination of the stages, the consolidation of the versions, the analysis of the contributions, the preparation of the feedback to the specialists between the Delphi rounds, and the systematic recording of decisions. It will also fall to the team to construct the matrix of normative and conceptual correspondence, select the pertinent Brazilian documents, systematise the comparative analyses, propose preliminary adaptive decisions, and carry out the version control that sustains the adapted version.

In the initial translation, two independent translators will be included, bilingual, with Brazilian Portuguese as their mother tongue and command of English: one with training and practice in the health field and prior knowledge of the ICPS, and another professional from the language field, without prior involvement with the object nor knowledge of the objectives of the classification. This composition, one translator with knowledge of the topic and another without prior familiarity with it, follows Beaton *et al.* (2000) and the ISPOR (Wild *et al.*, 2005), balancing conceptual precision, terminological adequacy, and linguistic naturalness. In the back-translation, two independent translators will be included, bilingual, with English as their mother tongue and command of Brazilian Portuguese, distinct from the initial translators and without access to the source document, so as to reduce biases. The review committee will be composed of the translators, the back-translators, a specialist in research methodology with experience in cross-cultural adaptation, and the research team.

Content validation will be carried out with the participation of seven specialists, intentionally selected by complementary competence profiles in public health, patient safety, quality management in health services, and mental health, all with prior experience in the SUS; the sizing of seven evaluators observes the recommendations of Lynn (1986) and of Polit, Beck, and Owen (2007), who recommend a group of six or more specialists for the adoption of the threshold of I-CVI ≥ 0.78 with adequate control of chance agreement. The inclusion of specific competence in mental health aims to strengthen the evaluation of the criteria relating to the psychological harm category, since it constitutes a harm category still poorly consolidated in the national incident notification systems.

Face validation will be conducted with eight professionals working in Patient Safety Centres (NSP), with experience in the analysis of adverse events and in the coordination of improvement actions arising from these events, and representation of different Brazilian regions. Eligibility will require prior experience in the SUS. Participation in the validation stages will occur only after formal agreement and signature of the Free and Informed Consent Form (TCLE).

2.7 STAGES OF THE STUDY

2.7.1 Initial translation

The source classification will be translated independently from English into Brazilian Portuguese by two bilingual translators, resulting in two initial versions (T1 and T2). The translator from the health field will prioritise the conceptual precision of the harm categories, the levels of harm, the level descriptors, and the decision criteria; the language professional will prioritise clarity, fluency, and naturalness. Each translator will record, in their own form, difficulties, uncertainties, and justifications for relevant terminological choices.

2.7.2 Synthesis of the translations

Versions T1 and T2 will be compared with each other and confronted with the source classification, identifying terminological divergences, differences in formulation, ambiguities, losses of meaning, and alternatives more suited to Brazilian Portuguese. From this analysis, the synthesis version (T12) will be prepared, by consensus between the research team and the translators, considering conceptual precision and linguistic adequacy. All decisions will be documented, with recording of the alternatives discussed, the selected option, and the respective justification.

2.7.3 Back-translation

Version T12 will be submitted to two independent back-translations into English (BT1 and BT2), with the purpose of verifying, in an indirect manner, whether the central meanings of the harm categories, the levels of harm, the level descriptors, and the decision criteria have been preserved. The back-translators will systematically record difficulties, uncertainties, and observations relevant to the evaluation of equivalence with the source material.

2.7.4 Committee review of the translated version

The committee review will analyse comparatively the source classification, versions T1, T2, and T12, the back-translations BT1 and BT2, and the previous methodological records. Each component of the classification, including harm categories, levels of harm, level descriptors, and decision criteria, will be appraised in terms of the semantic, idiomatic, experiential, and conceptual equivalences, by means of a structured form, in which each member will classify the degree of equivalence and indicate the need for adjustment; the agreement among the members and the comments will support the collegiate decision. Special attention will be given to the preservation of the original meaning and of the logical

structure of the decision criteria, including the requirement of fulfilment of all criteria in the low physical harm level and of at least one criterion in the other levels of harm.

Once discrepancies, ambiguities, omissions, shifts of meaning, or insufficient formulations are identified, the committee may propose wording adjustments, resume previously discussed alternatives, or recommend new formulation, provided that conceptual equivalence with the source classification is preserved. The decisions will be recorded in a specific instrument, with indication of the analysed unit, the problem, the alternatives considered, the decision adopted, and the justification. At the end, the committee's consensus version will be produced, in Brazilian Portuguese.

2.7.5 Normative and organisational contextualisation to the SUS

While the semantic and idiomatic equivalences are verified above all in the previous linguistic stages (initial translation, synthesis, back-translation, and committee review), the committee's consensus version will be submitted to the normative and organisational contextualisation to the SUS, a stage that operationalises the verification of the conceptual and experiential equivalences, given the normative dependence of the criteria of the classification (section 2.2).

The research team will analyse each harm category, each level of harm, and the respective level descriptors and decision criteria, identifying correspondences with Brazilian legislation, regulations, sanitary guidelines, and technical documents. A matrix of normative and conceptual correspondence will be constructed, organised by harm category, level of harm, level descriptor, and decision criterion. For each level descriptor and respective decision criterion, the fields of the matrix presented in Table 2 will be filled in.

Table 2

Structure of the matrix of normative and conceptual correspondence: fields and respective content recorded for each level descriptor and decision criterion

MATRIX COMPONENT	CONTENT RECORDED FOR EACH DESCRIPTOR AND DECISION CRITERION
Normative correspondence	Existence or absence of legislation, regulation, sanitary guideline, or Brazilian technical document related to the descriptor or decision criterion
Sources identified	Identification of the corresponding Brazilian documents
Implications	Implications of the normative correspondence, or of its absence, for the adaptation of the passage
Proposed decision	Maintenance, modification, inclusion, suppression, or insertion of an explanatory note

Adapted wording	Adapted wording of the descriptor or of the decision criterion, when applicable
Technical justification	Technical grounding of the adaptive decision adopted

Source: prepared by the authors (2026).

The adaptive decisions will preserve conceptual equivalence with the source classification and, simultaneously, favour coherence with the normative, sanitary, and organisational framework of Brazilian public health. At the end, the pre-final version will be produced, accompanied by the matrix, to be forwarded to the specialists in the content validation.

2.7.6 Content validation using the Delphi method

Content validation will be conducted using the Delphi method, with the participation of seven specialists, with the purpose of obtaining structured, anonymous, and iterative judgement on the technical and conceptual adequacy of the adapted version. The specialists will receive, by electronic mail, the access link to a structured form on the Microsoft Forms platform, accompanied by the pre-final version of the classification and the matrix of normative and conceptual correspondence, containing the correspondences identified, the documents considered, the preliminary adaptive decisions, and their respective justifications.

The evaluation will be organised by harm category and by level of harm. For each level, the level descriptor and the respective decision criteria will be submitted for the appraisal of the specialists, so that the validation reaches not only the concrete conditions of classification, but also the statement that characterises each level. By way of illustration, in the severe psychological harm level, both the level descriptor and the respective decision criteria will be evaluated, such as distress with the need for treatment for more than six months, limitation of activities or of independent living for more than six months, and new diagnosis or worsening of a mental health condition without expected recovery within six months.

Each level descriptor and each decision criterion will be evaluated in terms of clarity, relevance, and conceptual adequacy. Additionally, in each level of harm, sufficiency will be evaluated, that is, whether the descriptor and the set of criteria characterise in a complete manner the corresponding level. The appraisal will use a four-point ordinal scale, with 1 = not adequate, 2 = needs major revision, 3 = adequate with minor revision, and 4 = adequate. Scores 3 and 4 will be considered concordant. Scores 1, 2, and 3 will require justification in an open field. Considering that the score 3 expresses the need for minor revision, the elements whose consensus is predominantly based on this category may be improved before

consolidation, even if they reach the established quantitative threshold, so that numerical agreement does not dispense with qualitative improvement.

The I-CVI will be calculated separately for each evaluated element and for each applicable attribute, that is, for each level descriptor and each decision criterion in terms of clarity, relevance, and conceptual adequacy, as well as for sufficiency in each level of harm. The use of the I-CVI for clarity, conceptual adequacy, and sufficiency follows extensions already employed in the content validation literature, maintaining relevance as the central attribute of this index. The elements with I-CVI = 1.00 in all attributes will be accepted directly. For the others, the minimum threshold of I-CVI ≥ 0.78 will be adopted. Considering the panel of seven specialists, this threshold will correspond, in practice, to the agreement of at least six evaluators. Should losses occur between the rounds and the minimum quorum of six specialists be maintained, the criterion will correspond to the agreement of at least five evaluators. The S-CVI/Ave will also be calculated, adopting as a reference a value ≥ 0.90 , and the modified kappa, as a complementary measure of agreement adjusted for chance, interpreted as excellent (> 0.74), good (0.60 to 0.74), or satisfactory (0.40 to 0.59), according to Polit, Beck, and Owen (2007).

The process will be conducted in up to two rounds. After the first round, the elements that reach the acceptance parameters and do not present comments indicative of substantive revision will be maintained. The others will be revised by the research team in light of the qualitative justifications presented by the specialists. In the second round, the specialists will receive the pending elements already revised, accompanied by an anonymised synthesis of the results of the previous round, the main justifications, the alterations carried out, and the decisions adopted. The re-evaluated elements will again be submitted to the calculation of the I-CVI and the modified kappa.

The response rate and any losses between the rounds will be monitored and reported. There will be no substitution of specialists after the start of the process. The team will assess the maintenance of the minimum quorum of six specialists for the application of the previously defined thresholds. Consensus per evaluated element, level descriptor, or decision criterion will be considered reached when the element presents I-CVI ≥ 0.78 , modified kappa in a range that is at least satisfactory, and absence of qualitative comments indicative of substantive revision. The S-CVI/Ave will be used as a global indicator of the content validity of the evaluated version, adopting a reference value ≥ 0.90 .

Should the absence of consensus persist after the second round, the final decision will fall to the research team, in an exceptional manner, by means of technical justification grounded in conceptual equivalence with the source classification, in coherence with the

Brazilian normative and organisational framework, and in the qualitative contributions of the specialists. All decisions will be recorded in a traceability matrix, containing, for each evaluated element, the indices obtained, the relevant qualitative contributions, the decision adopted, the alteration carried out, when applicable, and the respective justification. The version resulting from the content validation rounds will constitute the revised version to be forwarded to the face validation.

2.7.7 Face validation by professionals who may use the classification in their institutional practice

Face validation will be conducted with eight professionals working in SUS NSP, from the version revised after the content validation. The stage will have as its purpose to examine evidence related to the response process and to the adequacy of the classification for institutional use. The participants will receive, by electronic mail, the access link to a structured form on the Microsoft Forms platform, accompanied by the revised version of the classification.

The form will contemplate items on language, comprehension of the descriptors and decision criteria, distinction between physical harm and psychological harm, organisation of information, interpretability, and ease of identification of the levels of harm. An open field will also be made available for recording difficulties, perceived ambiguities, unclear terms, and suggestions for improvement.

The appraisal will use a four-point ordinal scale: 1 = not clear or not comprehensible; 2 = needs major revision; 3 = clear and comprehensible, with minor revision; and 4 = clear and comprehensible. Scores 3 and 4 will be considered concordant. Scores 1, 2, and 3 will require justification in an open field, in order to support the qualitative interpretation of the responses and the identification of the necessary adjustments.

For each evaluated item, the I-FVI will be calculated, corresponding to the proportion of participants who attribute a score of 3 or 4. A minimum cut-off point of $I-FVI \geq 0.80$ will be adopted. Considering eight participants, this criterion will correspond, in practice, to the agreement of at least seven evaluators. The S-FVI/Ave will also be calculated, as proposed by Yusoff (2019).

The modifications arising from this stage will be restricted, primarily, to adjustments of wording, presentation, and organisation of the classification, without alteration of the conceptual decisions consolidated in the content validation. Exceptionally, should convergent quantitative and qualitative evidence indicate a relevant risk of inadequate interpretation or

important difficulty of practical application, a more in-depth revision may be carried out, provided that it is technically justified and recorded.

All contributions of the participants and the decisions arising therefrom will be recorded in a traceability matrix, containing, for each evaluated item, the indices obtained, the relevant qualitative comments, the decision adopted, the corresponding justification, and the alteration carried out, when applicable. The version resulting from this stage will constitute the final version of the adapted classification.

2.8 DATA MANAGEMENT, PROTECTION, AND AVAILABILITY

The recording instruments will be prepared for each stage and developed within the Microsoft 365 ecosystem, being organised by type of product. The textual documents will be maintained in Microsoft Word and will comprise the successive versions of the classification (T1, T2, the synthesis version T12, the back-translations BT1 and BT2, the committee's consensus version, the pre-final version, the revised version, and the final version), in addition to the feedback document to the specialists, when there is a second Delphi round. The matrices and spreadsheets will be maintained in Microsoft Excel and will include the comparative spreadsheet of the synthesis, the committee review matrix, the matrix of normative and conceptual correspondence, the validation consolidation spreadsheets, intended for the calculation of the indices (I-CVI, S-CVI/Ave, and modified kappa; I-FVI and S-FVI/Ave), for the organisation of the qualitative contributions, and for the recording of the decisions, and the traceability matrix. The structured collection forms will be constructed on the Microsoft Forms platform and will encompass the appraisal of the review committee and the content and face validations, in addition to the forms for recording difficulties and justifications filled in by translators and back-translators; the responses of the validations will be exported to the consolidation spreadsheets in Excel.

The data will be managed in folders organised by stage, with standardised identification of the files, version control, and recording of origin, date, and person responsible for each alteration. Identifiable information of the participants will be kept separate from the analytical bases, replaced by alphanumeric codes and accessible only to the team. The files will be stored in Microsoft OneDrive, under the responsibility of the lead researcher, with access control by individual credentials and periodic backups, in compliance with the protocol approved by the Research Ethics Committee (CEP) and with the General Personal Data Protection Law (LGPD) (Brasil, 2018). The final version, the evaluation instruments, and the matrix of normative and conceptual correspondence will be made available in an open-

access repository at the end of the study; data that may allow the identification of the participants will not be shared.

2.9 DATA ANALYSIS

The data analysis will be conducted in a sequential, systematic, and integrated manner, combining comparative analysis of versions, documentary analysis of normative sources, quantitative analysis of the validity indices, qualitative analysis of the justifications and suggestions of the participants, and integrative synthesis of the methodological decisions. The central objective will be to demonstrate the equivalence of the adapted version in relation to the source classification, its coherence with the normative, terminological, organisational, and operational context of the Brazilian Unified Health System, and the evidence of content and face validity.

In the stages of initial translation, synthesis of the translations, back-translation, and committee review, the comparative analysis will encompass terminological divergences, ambiguities, losses of meaning, idiomatic inadequacies, conceptual inconsistencies, and any inadvertent alterations in the thresholds between the levels of harm. Each discrepancy will be recorded in a specific matrix, with description of the problem identified, alternatives considered, consensual decision, and corresponding technical justification.

The stage of normative and organisational contextualisation will be analysed by means of the matrix of normative and conceptual correspondence, with identification of convergences between the source classification and the national regulatory framework, gaps in regulation, terminological ambiguities, and needs for adjustment. The decisions arising from this analysis may involve maintenance, modification, inclusion, suppression, or insertion of explanatory notes, always with technical justification recorded.

In the content validation, the responses obtained on the ordinal scale will be described by absolute and relative frequencies, considering scores 3 and 4 as concordant. The I-CVI will be calculated separately for each evaluated element and for each applicable attribute, including clarity, relevance, conceptual adequacy, and sufficiency, when pertinent. With seven specialists, the cut-off point $I-CVI \geq 0.78$ will correspond, in practice, to the agreement of at least six evaluators; should losses occur between the rounds and the minimum quorum of six specialists be maintained, the criterion will correspond to the agreement of at least five evaluators. The S-CVI/Ave will also be calculated, adopting as a reference a value ≥ 0.90 , and the modified kappa, as a complementary measure of agreement adjusted for chance, interpreted according to the parameters defined in section 2.7.6.

In the face validation, the responses will also be described by absolute and relative frequencies, considering scores 3 and 4 as concordant. For each evaluated item, the I-FVI will be calculated, and the S-FVI/Ave will be obtained from the average of the respective I-FVI. With eight participants, the cut-off point $I-FVI \geq 0.80$ will correspond, in practice, to the agreement of at least seven evaluators. In this stage, the quantitative results will primarily guide adjustments of clarity, organisation, presentation, and usability, without automatic reopening of the conceptual decisions consolidated in the content validation.

The interpretation of the results will not be limited to the quantitative indices. The values obtained will be analysed together with the justifications of the specialists, the comments of the participating professionals, and the matrix of normative and conceptual correspondence, so as to distinguish wording problems, conceptual inconsistencies, normative gaps, practical difficulties of application, and technically justifiable divergences. Elements with satisfactory quantitative indices may be adjusted when the comments indicate a risk of mistaken interpretation. In an exceptional manner, elements that do not reach quantitative consensus after the planned rounds may be maintained by means of technical justification grounded in conceptual equivalence with the source classification, in coherence with the Brazilian framework, and in the qualitative contributions of the participants, with explicit recording in the traceability matrix.

The open contributions obtained in the content and face validation stages will be submitted to descriptive-interpretative qualitative analysis. The comments will be organised by evaluated item and coded independently by two researchers of the team, considering analytical categories related, among other aspects, to clarity, terminology, conceptual equivalence, applicability to the SUS, normative coherence, ambiguity, and usability. Coding divergences will be resolved by consensus and, should disagreement persist, by a third researcher, ensuring traceability between comments, decisions, and alterations carried out.

At the end of the validation stages, the quantitative and qualitative findings will be integrated into a matrix of methodological decision and traceability, which will record, for each descriptor, decision criterion, or evaluated item, the indices obtained, the relevant qualitative contributions, the team's decision, the technical justification, and the alteration carried out, when applicable. The final version will be consolidated with a view to the preservation of conceptual equivalence with the source material, of the consistency of the structure of harm categories, levels of harm, level descriptors, and decision criteria, as well as of coherence with the normative, terminological, organisational, and operational context of the SUS.

2.10 ETHICAL ASPECTS

The study will be conducted in compliance with Resolução CNS nº 466/2012 (Brasil, 2012) and other Brazilian regulations applicable to research with human beings. The project was submitted to and approved by the Research Ethics Committee with Human Beings of the Faculdade de Ciências da Saúde of the Universidade de Brasília, under CAAE nº 60244722.5.0000.0030 and Opinion nº 7.562.342. Participation will occur upon signature of the TCLE, with a guarantee of voluntariness, confidentiality of information, anonymity among the participants in the validation process, and the right to withdraw at any time, without any prejudice.

2.11 CURRENT STATUS AND TIMELINE

At the date of submission of this manuscript, the study is in the initial translation phase. It is estimated that the stages of initial translation, synthesis of the translations, back-translation, committee review, and normative and organisational contextualisation to the SUS will be completed in approximately four weeks, resulting in the pre-final version of the classification and the respective matrix of normative and conceptual correspondence. Subsequently, approximately three months are foreseen for the final stages: two months allocated to the content validation using the Delphi method, with up to two rounds, and to the face validation; and one month allocated to the integrated analysis of the results, the recording of decisions in a traceability matrix, and the consolidation of the final version of the adapted classification. The detailed timeline and any amendments to the protocol will be recorded on an open-access platform, preserving the version history.

3 DISCUSSION

It is assumed that the incorporation, into another national context, of a patient safety classification conceived in a particular health system is not reduced to linguistic translation. It is admitted, based on the methodological literature, that instruments and classifications whose criteria depend on contextual interpretation demand formal cross-cultural adaptation, capable of preserving the semantic, idiomatic, experiential, and conceptual equivalences between the source version and the adapted one (Guillemin; Bombardier; Beaton, 1993; Beaton *et al.*, 2000).

In the case of the levels-of-harm classification of NHS England, it is presumed that cross-cultural adaptation is necessary, since its decision criteria involve organisational, care, and normative dimensions that would demand interpretation in light of the SUS context. In Brazil, this need would be associated with a possible gap: the "degree of harm" field of

Notivisa resorts to semantically broad descriptors and does not differentiate physical from psychological harm, which could compromise analytical precision and the comparability of data (Cooper *et al.*, 2018).

A central aspect is to treat the object as an operational classification, and not as a psychometric scale. Being composed of harm categories, levels, descriptors, and decision criteria, without generating scores, its adaptation is sustained on evidence of content and response process validity, not on analyses of internal structure or relation with external variables (American Educational Research Association; American Psychological Association; National Council on Measurement in Education, 2014; Terwee *et al.*, 2018). This delimitation adjusts the design to the nature of the object and makes explicit the scope of the validity inferences.

The normative and organisational contextualisation to the SUS is the main differential of this protocol in comparison with strictly linguistic adaptations. The criteria of the source classification incorporate references to types of care, temporal parameters, levels of care intervention, and recording conditions that may have correspondence, implications, or limits of application in the normative, organisational, and care context of Brazilian public health. Brazil already has, moreover, an institutional record of the degree of harm in Notivisa, which should be considered so that the adapted version dialogues with the practice in force and grounds, in a coherent manner, any recommendations for improvement. Transposing the criteria of the source document without prior examination of their normative, organisational, and terminological compatibility would preserve the form of the original classification, but would compromise its interpretive consistency and its practical applicability.

The Brazilian experience with the London Protocol illustrates the challenges of incorporating methods conceived in other health systems without formally described and publicly available cross-cultural adaptation. In Brazil, the method is employed above all in the analysis of incidents that resulted in death and of never events (Agência Nacional de Vigilância Sanitária, 2025; Agência Nacional de Vigilância Sanitária, 2026), but its application occurs in a normative context distinct from that in which it was developed. One example is the absence, in the Brazilian legal order, of a specific and operationally equivalent legal duty to the British Duty of Candour, which mandates open communication with patients and family members following serious adverse events (Care Quality Commission, 2025; Quick, 2022). This normative difference may generate uncertainties as to the operationalisation of components of the method that depend on formalised practices of transparency, communication, and involvement of the people affected, favouring interpretive doubts and

variations in the conduct of these practices in Brazil, including in the SUS. Such asymmetry reinforces the need for structured adaptation processes.

The distinction between physical harm and psychological harm, incorporated by the LFPSE of NHS England, represents a relevant advance in the gradation of harm associated with patient safety events and aligns with international efforts to render visible forms of harm that have historically been neglected (World Health Organization, 2024; Pfeiffer *et al.*, 2025). In a conceptual framework developed in oncology, Dreismann *et al.* (2025) define preventable psychological harm as that arising from actions or omissions in interactions with the health system, including communication failures, lack of respect, and inadequate organisational policies, which deviate from patient-centred care and may negatively affect the well-being and health behaviour of patients and family members. The proposal seeks to render measurable, analysable, and preventable harm that is frequently invisible in care practice.

In the SUS, this category of harm is not yet established in the instruments and processes for responding to patient safety incidents. Its adaptation, therefore, is not a mere stage of conceptual equivalence, but an opportunity to introduce, in a structured and methodologically grounded manner, an aspect still insufficiently contemplated in the national classification system, which justifies the inclusion of mental health specialists in the content validation.

The protocol starts from the premise that the structural and logical particularities of the source material that sustain the fidelity of the adaptation should be preserved, whenever possible. The research team intends, thus, to maintain the asymmetry between the five levels of physical harm and the four of psychological harm, without a fatal level in the latter, and the requirement of all criteria in the low physical harm level, in contrast to at least one criterion in the other levels. These decisions will be submitted to the appraisal of the specialists in the content validation using the Delphi method and may be adjusted should there be technical consensus as to the need for adaptation to the normative, terminological, and operational context of the SUS.

The choice of the Delphi method is justified by the need for structured, anonymous, and iterative judgement by specialists on criteria whose interpretation is sensitive to context (Hasson; Keeney; McKenna, 2000). Its strength, in this protocol, lies in the mixed reading: the quantification through indices with thresholds defined a priori confers objectivity, while the requirement of justification for the scores that signal revision ensures that the values are interpreted in light of the qualitative reasons of the evaluators (Polit; Beck; Owen, 2007).

This mixed reading articulates quantitative results, qualitative justifications, and a traceability trail of decisions, allowing wording problems to be distinguished from conceptual

inconsistencies, normative gaps, and technically justifiable divergences, and expanding the robustness and reproducibility of the process. Face validation with NSP professionals examines evidence of the response process: clarity, comprehensibility, organisation, interpretability, and usability, a decisive dimension for the routine application of the classification and coherent with the operational nature of the object (Yusoff, 2019).

Transparency and reproducibility are reinforced by the prior registration of the protocol in an open-access repository, with a persistent identifier, and by adherence to consolidated reporting references: the good practices of the ISPOR and the guidelines of Sousa and Rojjanasrirat for the adaptation, the CREDES for the conduct and reporting of the Delphi rounds, and the recommendations of COSMIN insofar as applicable to a non-psychometric object (Wild *et al.*, 2005; Sousa; Rojjanasrirat, 2011; Jünger *et al.*, 2017; Terwee *et al.*, 2018). Added to the auditable recording of decisions at all stages, this set permits external scrutiny of the path that sustains the adapted version.

The composition of the participants of the validation stages is likewise anchored in the methodological literature on content validation, the Delphi method, and face validation (Hasson; Keeney; McKenna, 2000; Polit; Beck; Owen, 2007; Yusoff, 2019). The selection of specialists and of professionals who may use the classification in their institutional practice, with prior experience in the SUS and originating from different Brazilian regions, favours the pertinence and applicability of the decisions to the target context.

The adapted version should be understood as an initial stage of a broader agenda for the qualification of patient safety in the RAS. Since the establishment of the PNSP, advances have been observed in the implementation of computerised notification systems and in the expansion of the use of Notivisa, indicative of greater maturity of the recording culture (Maia *et al.*, 2018; Faustino *et al.*, 2021; Villar; Martins; Rabello, 2021). This increase makes the qualification of the harm classification even more relevant, since more precise data more robustly sustain the prioritisation of analyses, the allocation of efforts, and the definition of improvement actions proportionate to the risk (Cooper *et al.*, 2018). The study is, moreover, opportune in light of recent milestones that reposition the person and safety at the centre of the system, such as the Estatuto dos Direitos do Paciente and the PNQSP, which reinforce the need for clearer and more consistent instruments to define the harm resulting from incidents (Brasil, 2026a; Brasil, 2026b).

Some limitations must be acknowledged. The selection of the specialists and of the professionals who may use the classification in their institutional practice is intentional and of limited size. This characteristic, added to the absence of direct participation of patients and family members in the judgement, may restrict the generalisation of the findings;

nevertheless, the form of involvement of these people is incorporated as an object of discussion in the validation stages. Although it contemplates regional diversity and multiprofessional competence, the design does not fully encompass the heterogeneity of care, normative, and organisational contexts of the SUS, so that the adaptive decisions may predominantly reflect the institutional experiences represented by the participants, which recommends caution in generalisation to very distinct scenarios. Such limitations are inherent to cross-cultural adaptation processes (Beaton *et al.*, 2000; Alavi; Le Lagadec; Cleary, 2026) and reinforce the pertinence of subsequent stages of evaluation of the classification in different contexts of the RAS.

Finally, the operational nature of the object delimits the scope of the validity inferences, which do not contemplate evidence of internal structure or of relation with external variables. The adapted version is tied, moreover, to a specific date and version of the source document, whose subsequent updates will only be incorporated upon new documented methodological deliberation.

By proposing a methodologically structured adaptation, instead of the direct incorporation of an international classification, this study intends to contribute in two dimensions. On the methodological plane, it seeks to reinforce rigour in the adaptation of operational harm classifications for systems with a normative and organisational framework distinct from that of origin, proposing a replicable path that integrates cross-cultural adaptation, normative contextualisation, and contemporary validity evidence. On the care and systemic plane, it adds to the efforts for the qualification of safe care in the SUS, by favouring more comparable data, responses proportionate to the different types and levels of harm, and the strengthening of learning from incidents. The main strengths and limitations of the protocol are synthesised in Table 3.

Table 3

Main strengths and limitations of the study

STRENGTHS
This study protocol combines a consolidated reference of cross-cultural adaptation (Beaton <i>et al.</i> ; ISPOR; Sousa and Rojjanasrirat) with a contemporary framework of validity evidence, conferring rigour and reproducibility to the process.
The normative and organisational contextualisation to the SUS, operationalised by a correspondence matrix, is a differential in comparison with strictly linguistic adaptations.
The content validation, using the Delphi method, and the face validation are interpreted in a mixed manner, integrating quantitative indices with qualitative justifications and a documented path of decisions.
LIMITATIONS
As this is a classification of the level of harm, and not a psychometric instrument, no evidence of internal structure or of relation with external variables is produced, which delimits the scope of the validity inferences.

The choice of the specialists and of the professionals who may use the classification in their institutional practice is intentional and of limited size, without the direct participation of patients, which may restrict the generalisation of the findings.

Source: prepared by the authors (2026).

4 CONCLUSION

This protocol outlines the methodological path for the translation, cross-cultural adaptation, and validation, into Brazilian Portuguese, of the classification of levels of harm associated with patient safety events published by NHS England, oriented towards obtaining a version conceptually equivalent to the original and compatible with the normative and organisational context of the SUS. By stratifying the physical and psychological dimensions of harm and by offering more structured decision criteria for the attribution of the levels, it is expected that the validated version will qualify the information produced in notification systems, favour monitoring and organisational learning, and sustain more proportionate and transparent responses to patient safety events, contributing to the strengthening of the safety culture in the SUS.

ABSTRACT

This article examines three structural normative inconsistencies in the legal regime for the repression of gender quota fraud, as constructed by the Brazilian Superior Electoral Court through Precedent No. 73 and Resolution No. 23,735/2024. The first antinomy concerns the limits of the Court's regulatory power: Article 105 of Law No. 9,504/1997 and Articles 1, sole paragraph, and 23, IX, of the Electoral Code authorise the issuance of instructions for the faithful execution of electoral legislation but prohibit innovation in substantive law, a limit strained by the dispensation of the subjective element in Article 8, § 4, of Resolution No. 23,735/2024 and by the open-textured typification consolidated in Precedent No. 73. The second antinomy concerns the judicial creation of a sanctioning modality not codified in statute: the cancellation of the Statement of Party Acts Compliance (DRAP) through Electoral Judicial Investigation Action and Action for the Annulment of Elective Mandate, with material effects of annulling the proportional slate, recalculating electoral and party quotients, and attributing eight-year ineligibility. The third antinomy reveals an internal contradiction within the jurisprudence itself: the political party is held to lack passive standing in AIJE proceedings, yet the DRAP (the legal act being cancelled) is held by the party. The article frames these three tensions in dialogue with the doctrine of the executive regulation, with the principle of legality of electoral sanctions, and with substantive due process, and argues that the normalisation of the current regime requires, at minimum, legislative mediation.

execução da legislação eleitoral, mas vedam a inovação no direito material, limite tensionado pela dispensa do elemento subjetivo no art. 8º, § 4º, da Resolução nº 23.735/2024 e pela tipificação aberta consagrada na Súmula nº 73. A segunda antinomia diz respeito à criação pretoriana de modalidade sancionadora não tipificada em lei: a cassação do Demonstrativo de Regularidade de Atos Partidários (DRAP) por meio de Ação de Investigação Judicial Eleitoral e de Ação de Impugnação de Mandato Eletivo, com efeitos materiais de anulação da chapa proporcional, retotalização dos quocientes eleitoral e partidário e atribuição de inelegibilidade octenal. A terceira antinomia revela contradição interna na própria jurisprudência: o partido político é considerado parte ilegítima para figurar no polo passivo da AIJE, mas o DRAP, ato jurídico que se cassa, é titularizado pelo partido. O artigo articula essas três tensões em diálogo com a doutrina do regulamento de execução, com o princípio da tipicidade das sanções eleitorais e com o devido processo legal substancial, e sustenta que a normalização do regime atual exige, no mínimo, mediação legislativa.

1 INTRODUCTION

The gender quota policy, set out in Article 10, § 3, of Law No. 9,504/1997, as amended by Law No. 12,034/2009, represents one of the most significant affirmative actions of Brazilian electoral law. Conceived to correct the historical under-representation of women in spaces of political power, the rule requires each party or federation to fill a minimum of thirty per cent and a maximum of seventy per cent of candidacies for each gender.

The formulation appears, at first sight, strictly quantitative, but as institutional experience has demonstrated, it has become the axis of one of the most innovative and most dogmatically strained jurisprudential constructions of the Superior Electoral Court over the last two decades, with effects that go beyond the mere reading of the percentage and reach the very sanctioning architecture of the electoral system.

The judicialisation of the matter presented the Superior Electoral Court with a dogmatically novel problem: the merely formal compliance with the minimum percentage, by registering female candidacies without any genuine intention to compete, empties the purpose of the affirmative policy and converts the protective rule into an instrument of simulation.

The jurisprudential response — developed in the case of José de Freitas/PI (REspe No. 1-49/PI, Rapp. Min. Henrique Neves da Silva, judged on 4 August 2015), deepened in the case of Valença do Piauí (REspe No. 193-92/PI, Rapp. Min. Jorge Mussi, judged on 17 September 2019) and in the case of Jacobina/BA (AgR-AREspE No. 0600651-94, drafter of the judgment Min. Alexandre de Moraes, judged on 10 May 2022), regulated by TSE Resolution No. 23,735 of 27 February 2024, and finally consolidated in Precedent No. 73, approved on 16 May 2024 — constructed, in little less than a decade, an entire regime for the identification, ascertainment and repression of so-called fictitious candidacy.

This construction, although indispensable to preserving the constitutional programme of gender equality in politics, was carried out from the top down: the Courts defined the contours of the wrongdoing, the effects of a successful claim, the evidentiary regime and the applicable procedure, even before the National Congress had provided, in formal law, for each of these elements. This precedence of jurisprudence over statute is, in the sanctioning field, more than an institutional curiosity; it is, as will be sought to be demonstrated, a source of structural dogmatic tensions that the present article proposes to examine.

The present article draws on the theoretical and empirical findings of the master's research conducted by the author at the Instituto Brasileiro de Ensino, Desenvolvimento e Pesquisa (IDP), in the context of the jurisprudential analysis of the judgments of the Tribunal

Regional Eleitoral de Goiás between 2022 and 2025, in order to deliberately shift the focus of the discussion.

That research examined, above all, the evidentiary problem of quota fraud: the centrality of circumstantial evidence, the plurality of decisional standards, inferential convergence as a criterion substituting direct proof and the impossibility of rigid uniformisation in the face of factual heterogeneity.

Here, the proposal is to shift the analytical axis from evidence to normativity: to investigate whether the regime constructed by the Superior Electoral Court, in its formal structure, satisfies the requirements of strict legality, sanctioning typicity and due process that govern the electoral repressive system. The question, in other words, is no longer how fraud is proven, but whether the regime that punishes fraud is founded on an adequate normative basis.

Three inconsistencies are examined. The first concerns the limits of the regulatory power of the Superior Electoral Court. Article 105 of Law No. 9,504/1997 authorises the issuance of instructions for the faithful execution of the law, without restricting rights or establishing sanctions distinct from those provided for in this Law — a formula reiterated in Articles 1, sole paragraph, and 23, item IX, of the Electoral Code. The question is whether Resolution No. 23,735/2024, by dispensing with the subjective element of fraud (Article 8, § 4), and Precedent No. 73 itself, by consolidating an open-textured type of wrongdoing, have not exceeded that limit.

The second has as its object the creation, by jurisprudential construction, of a sanctioning modality not codified in statute: the cancellation of the Statement of Party Acts Compliance, with material effects on the proportional slate, on the votes attributed to candidates considered individually and on the elected candidate, through Electoral Judicial Investigation Action and Action for the Annulment of Elective Mandate, actions whose legal basis did not provide for this effect, and whose procedural architecture was designed for distinct purposes.

The third, finally, exposes an internal logical contradiction within the system itself: the consolidated jurisprudence of the Superior Electoral Court holds that the political party does not have standing to figure as a defendant in AIJE proceedings; however, the DRAP (the legal asset that is cancelled) is, indisputably, a party act. In the final analysis, the one who could not be a party — and whose procedural position was never consolidated in the original legal relationship — is punished.

The central hypothesis of this work is that these three inconsistencies are not contingent, do not arise from isolated errors or drafting imprecisions that could be corrected

by mere interpretative rectification, but are structural: they arise from a legislative deficit that has been supplied by jurisprudential and regulatory construction of such magnitude that, at the limit, it causes the dogmatic distinction between execution and innovation in electoral sanctioning law to collapse.

What is maintained here does not deny the material legitimacy of combating gender quota fraud; on the contrary, it proceeds from the conviction that affirmative action must be effectively protected, on pain of becoming a dead letter, but it affirms that the form of this combat, in its current state, compromises the coherence of the system and demands, urgently, the intervention of the legislator. The argument is therefore twofold: it recognises the necessity of the combat and questions the formal sufficiency of the instruments.

2 THE QUOTA POLICY AND THE EMERGENCE OF FRAUD AS A LEGAL-ELECTORAL CATEGORY

2.1 FROM FACULTATIVE RESERVATION TO MANDATORY FILLING: THREE NORMATIVE CYCLES

The Brazilian regime of gender quotas has passed through three successive normative cycles, an understanding of which is decisive for the examination of the dogmatic antinomies that follow. The first was inaugurated by Law No. 9,100/1995, which reserved a minimum percentage of female candidacies for the 1996 municipal elections, and continued with the original wording of Law No. 9,504/1997, which established the rule of reservation (not yet of filling) of a minimum of thirty per cent of the seats for candidacies of each gender.

The difference is not merely terminological, but dogmatically decisive: the original wording authorised the party to reserve seats that did not need to be occupied, a hypothesis rapidly converted into a generalised institutional practice. The low effectiveness of the model is documented in the official data, since in the subsequent proportional elections the female presence on the slates fluctuated below the minimum percentage legally reserved, without this generating, in most cases, any relevant legal consequence, because the reservation was itself, to a large extent, an act of symbolic compliance.

The second cycle opened with Law No. 12,034/2009, which replaced the verb 'reserve' with 'fill', imposing on parties the effective obligation to include the minimum percentage of female candidacies. It was precisely in this cycle, between 2009 and 2016, that the phenomenon today known as fictitious candidacy was developed: faced with the requirement of filling, parties began to register women without any real expectation of competing, with the sole objective of formally complying with the quota and avoiding the rejection of the collective registration of the slate.

The pathology is therefore structurally dependent on the normative design: it was the legal regime that created the conditions for its own fraud. The migration from reservation to filling, without the concomitant establishment of mechanisms for materially assessing the effectiveness of the candidacy, opened the flank that party engineering promptly exploited. In this sense, quota fraud is not a contingent deformation of the rule, but a rational response by political actors to the regulatory incentive, a diagnosis that conditions the entire subsequent dogmatic discussion.

The third cycle is jurisprudential and still ongoing. From the judgment of REspe No. 1-49/PI, in August 2015, the Superior Electoral Court recognised, for the first time, that the concept of electoral fraud is open-textured and may reach fraud against the law, a premise that subsequently enabled the application of the figure to the merely formal compliance with the minimum percentage.

The case of José de Freitas/PI became a leading case and established the paradigm of substantive (not merely arithmetic) examination of compliance with the quota. From then on, the construction was progressive and cumulative: the case of Valença do Piauí (REspe No. 193-92/PI, Rapp. Min. Jorge Mussi, judged in 2019) fixed the thesis of the collective cancellation of the Statement of Party Acts Compliance as a consequence of fraud; the case of Jacobina/BA (AgR-AREspE No. 0600651-94, drafter of the judgment Min. Alexandre de Moraes, judged in 2022) refined the circumstantial criteria that allow, at the evidentiary level, the inference of fraud — zero or negligible votes for the female candidates, accountability statements with identical financial movements, absence of effective campaign acts; TSE Resolution No. 23,735 of 27 February 2024 provided for electoral wrongdoings and positivated the indicia in its Article 8; and Precedent No. 73, approved in the administrative session of 16 May 2024, consolidated the understanding under a deliberately open-textured formula.

Each of these stages added regulatory layers onto the static legal basis of Law No. 9,504/1997, without the legislator having, at any moment, intervened to endorse or adjust the product of the jurisprudential construction.

2.2 THE LEGAL CATEGORY OF QUOTA FRAUD AND THE CURRENT REGIME

Gender quota fraud, as it is understood today, presents an open-textured type, configured from the contextual articulation of indicia, and not from subsumption to a typical and closed legal description.

TSE Resolution No. 23,735/2024 systematised, in Article 8, §§ 2 and 3, the circumstantial criteria consolidated by the Court's jurisprudence: zero or derisory votes for

the female candidates, accountability statements with identical financial movements, absence of effective campaign acts for their own benefit (§ 2), and party negligence revealed by the legal unviability of the candidacy, inertia in remedying documentary deficiencies or absence of replacement of a candidate whose registration was rejected (§ 3).

These criteria, according to the regulatory construction itself, are not cumulative, do not operate as absolute presumptions and do not constitute a *numerus clausus* list; they function as an open catalogue whose contextual combination authorises the inference of the teleological distortion of the rule. The model is therefore deliberately flexible, this flexibility being, at the same time, its greatest empirical virtue and its greatest dogmatic fragility.

Paragraph 4 of Article 8, however, introduced an innovation of great magnitude in providing that, for the characterisation of fraud, the teleological distortion is sufficient, dispensing with the demonstration of the subjective element (*consilium fraudis*). Fraud ceases to be a wrongdoing of conduct, in which the agent's awareness and will are assessed, to become a wrongdoing of result, it being sufficient to verify objectively the divergence between the normative programme and the state of affairs produced, breaking with the civil doctrine of fraud, which required at least the *scientia fraudis*. Whether this material redefinition is compatible with the regulatory and precedential instruments employed is the question examined in section 3.

In terms of legal consequences, fraud produces material effects expressly provided for in Article 8, § 5, of TSE Resolution No. 23,735/2024 and in Precedent No. 73. According to the regulatory text, gender quota fraud entails the cancellation of the diploma of all elected female candidates and of all elected candidates, the invalidation of the list of candidacies of the party or federation that availed itself of it and the annulment of nominal and party votes, with the consequences provided for in the caput of Article 224 of the Electoral Code.

In synthetic terms, three material effects accumulate: the cancellation of the slate's proportional DRAP, with the annulment of all votes attributed to the party or federation in the constituency; the recalculation of the electoral and party quotients, with possible alteration of the picture of the elected in other party associations; and ineligibility, for eight years, of those responsible for the fraud, such as party leaders, candidates of the slate in collusion and, in controversial hypotheses, the instrumentalised candidate herself, although the more recent jurisprudence, in dialogue with Law No. 14,192/2021, tends to recognise the latter as a victim of the wrongdoing.

It is precisely the design of this regime (open-textured type, dispensation of the subjective element and sanctions of high material gravity) that makes the examination of the three antinomies that follow pertinent. The question is not whether combating fraud is

legitimate (it is), but whether its legal-formal design satisfies the requirements of strict legality of sanctions, material typicity of the wrongdoing and structured adversarial procedure.

3 FIRST ANTINOMY: THE LIMITS OF THE REGULATORY POWER OF THE SUPERIOR ELECTORAL COURT

3.1 THE LEGAL REGIME OF INSTRUCTIONS: ARTICLE 105 OF LAW NO. 9,504/1997 AND THE ELECTORAL CODE

The Superior Electoral Court exercises a peculiar regulatory function, distinct from the classic administrative regulation. Unlike the regulation of the Head of the Executive (Article 84, IV, of the Constitution), aimed at making executable a law already in force on matters of the organisation of the administration, the instructions of the Electoral Justice constitute a *sui generis* normative category, exercised by a Court that accumulates administrative, normative and jurisdictional functions.

This peculiarity does not expand, but restricts the limits of the regulatory power: the Court that issues the regulation will also be the one that applies it in contentious proceedings, which makes restraint within strict bounds all the more necessary.

The main legal landmarks of this function are three. Article 1, sole paragraph, of the Electoral Code (Law No. 4,737/1965) determines that the Superior Electoral Court shall issue instructions for the faithful execution of the Code; Article 23, IX, of the same statute lists among the private competences of the Court the issuance of the instructions it deems convenient for its execution; and the third, most relevant to the subject, is Article 105 of Law No. 9,504/1997:

Until the 5th of March of the election year, the Superior Electoral Court, in accordance with the regulatory nature and without restricting rights or establishing sanctions distinct from those provided for in this Law, may issue all the instructions necessary for its faithful execution, having previously heard, in public hearing, the delegates or representatives of the political parties. (BRASIL, 1997, art. 105)

The joint reading of the three provisions reveals four structural limits that merit analytical emphasis. The first is the temporal limit, namely, the issuance until 5 March of the electoral year, a deadline intended to avoid regulatory innovations in proximity to the poll. The second is the procedural limit, being the prior hearing of the parties in public hearing, a requirement that confers on the process of drafting the instructions an atypical participatory dimension, distinct from the purely unilateral regulation. The third is the material limit expressed in the prohibition on restricting rights or establishing sanctions distinct from those provided for in the law, a formula which, on pain of becoming an empty word, must be read

in a robust sense, reaching not only the creation of literally new sanctions, but also the redefinition of the constitutive elements of existing sanctions. The fourth, finally, is the teleological limit, considering that the instructions exist for the faithful execution of the law, an expression that presupposes a pre-existing legal content to be executed, and not a normative space to be filled by the autonomous construction of the Court.

It is an executive regulation, and not an autonomous one: its function is to make executable what the law has already provided (deadlines, forms, rites, formal requirements), not to introduce new substantive provisions. The 1988 Constitution expressly prohibited autonomous regulation in matters reserved to statute, and the electoral system, by its proximity to fundamental political rights, is a matter reserved to formal law, when not to complementary law (the case of the hypotheses of ineligibility of Article 14, § 9, of the Constitution).

3.2 THE LEGAL NATURE OF INSTRUCTIONS: EXECUTIVE REGULATION, NOT INNOVATION

The consolidated administrative doctrine — *Bandeira de Mello, Carvalho Filho* — converges in the diagnosis that the executive regulation cannot innovate in the legal order in matters reserved to statute, on pain of violation of the principle of the separation of powers (Article 2 of the Constitution) and the principle of legality (Article 5, item II).

The prohibition takes on even more rigid contours when the object of regulation involves sanctioning law: in the electoral field, the cancellation of registration, the cancellation of the diploma and the declaration of ineligibility are consequences of high material gravity, which affect the core of fundamental political rights, above all the right to be voted for. From the historical dialogue between the tax and criminal doctrines results the consolidation of a broad principle of sanctioning legality, applicable to all law that produces a restriction of fundamental rights, a principle that, in the electoral field, finds direct expression in Article 105 of Law No. 9,504/1997.

The consequence of this doctrinal convergence is direct: the Superior Electoral Court, in issuing instructions on the basis of Article 105 of Law No. 9,504/1997 or Articles 1, sole paragraph, and 23, IX, of the Electoral Code, exercises a derived and subordinate function. It cannot create new sanctioning types, the typification of electoral wrongdoings being a matter reserved to statute. It cannot dispense with constitutive elements of already existing types — the material redefinition of the type exceeds the executory function. It cannot redefine the evidentiary regime so as to alter the regime of liability — for the alteration of the

evidentiary standard, when substantive, is equivalent to the alteration of the very definition of the wrongdoing.

These three prohibitions operate jointly and form the perimeter of what can and cannot be regulated by the Court without legislative mediation. The fact that the Electoral Justice accumulates administrative and jurisdictional functions does not authorise, it must be repeated, the relaxation of this rule; on the contrary, it demands special caution.

There is, however, a doctrinal argument to the contrary, which needs to be addressed. It is maintained, with some support in the jurisprudence of the Superior Electoral Court itself, that the regulatory function of the Court would have an amplitude superior to the classic executive regulation, by reason of its mixed institutional nature, administrative and jurisdictional at the same time.

This thesis of institutional specificity finds acceptance in some judgments that recognised the Electoral Justice a wider regulatory space than that granted to the regulation of the Executive Power. The objection is not insuperable: even if a greater amplitude is admitted in strictly procedural matters (forms, deadlines, rites), this amplitude does not extend, without legislative mediation, to the terrain of the material definition of sanctioning wrongdoings. Institutional specificity is not a general clause for the relaxation of strict legality; it is, at most, a justification for some deference in operational matters.

3.3 THE DISPENSATION OF THE SUBJECTIVE ELEMENT (RESOLUTION NO. 23,735/2024, ARTICLE 8, § 4)

It is precisely at this point that the first antinomy manifests itself most clearly. Resolution No. 23,735/2024 provided, in Article 8, § 4, that for the characterisation of gender quota fraud, the teleological distortion is sufficient, dispensing with the demonstration of the subjective element (*consilium fraudis*), and Precedent No. 73, in the same sense, provides that the sanction reaches the party and the candidates linked to it regardless of proof of participation, knowledge or acquiescence.

Before the Resolution, the dominant doctrine required the *consilium fraudis*, the conscious arrangement between agents for the merely formal compliance with the percentage. From it, the teleological distortion objectively ascertained by the *indicia* is sufficient. This dispensation may be supported by robust empirical reasons, but it is, without doubt, an alteration of dogmatic foundations that needs to face the test of the adequate normative form.

The central dogmatic question is: can the Superior Electoral Court, in the exercise of the regulatory power of Article 105, suppress by instruction an element that the classic

doctrine considered constitutive of the wrongdoing? To suppress the subjective element is, in the final analysis, to redefine the type, transforming it from a wrongdoing of conduct into a wrongdoing of result. This redefinition is not executory, but constitutive and, for this reason, exceeds the limits of the executive regulation, a difference between executing and constituting that has been rigorously preserved in other fields of sanctioning law, such as the tax and the criminal.

It is not intended thereby to maintain the invalidity of Resolution No. 23,735/2024 or to propose its challenge. The construction is, from a material point of view, defensible, given that the requirement of the subjective element, in practice, made the configuration of fraud unviable (because the specific intent, in candidacies whose direct agents are people close to the candidate and who never admit collusion, was a practically insuperable obstacle) and rendered the affirmative policy a dead letter. What is maintained is more modest, given that the form of the response (regulatory instruction) is not compatible with the magnitude of the dogmatic modification promoted. The constitutionally adequate path would be legislative mediation, with amendment of Article 10, § 3, of Law No. 9,504/1997 or an express provision in Complementary Law No. 64/1990 making it explicit that fraud is configured objectively. The absence of this mediation produces the dogmatic tension that is examined.

3.4 PRECEDENT NO. 73, ARTICLE 926 OF THE CPC AND THE PROBLEM OF STABILISATION

An additional argument, which reinforces the first antinomy, arises from Precedent No. 73 of the Superior Electoral Court itself, which states, in synthesis, that quota fraud is configured when the facts and circumstances of the concrete case authorise the recognition of the teleological distortion of the rule.

The statement is deliberately open-textured and this openness is, in part, an inevitable consequence of the factual heterogeneity of the cases: each municipality, each slate, each candidacy presents specific circumstances that hinder closed typification. But the openness is also a consequence of an institutional choice, given that the Court opted to consolidate an open-textured type in precedential format rather than to await legislative mediation that would typify the elements of fraud. The choice was pragmatic and, in terms of effectiveness, successful; however, in terms of strict legality, problematic.

Article 926 of the Code of Civil Procedure determines that the courts shall standardise their jurisprudence and keep it stable, complete and coherent. The coexistence of Precedent No. 73 with Resolution No. 23,735/2024 (one as interpretative consolidation, the other as

procedural regulation) produced a regulatory model coherent in its internal structure, but problematic in its external foundations.

The coherence between the precedential statement and the regulatory resolution does not resolve the prior question, considering that neither of the two instruments can, in isolation or jointly, supply the function that falls to the law in the formal sense, namely, to define the elements of the electoral wrongdoing and its sanctioning consequences.

The integrity of the jurisprudence, in the sense of Article 926, presupposes, first, normative integrity between the regulatory act and the legal basis, and it is precisely this primary integrity that is strained when the regulation exceeds the legal basis. Article 926, therefore, does not cure, but aggravates the primary antinomy, for it requires the stability of a jurisprudence that is founded on a dogmatically fragile instrument.

The first antinomy, in synthesis, is normative in a double sense, having on one side a formal limit, consisting of the excess of regulatory competence, in the use of the instruction for material purposes that exceed the executory function; on the other, a material limit, consisting of the insufficiency of typicity arising from the consolidation of an open-textured type and the dispensation of a constitutive element. This fragility is projected onto the two following antinomies, which are, to a large extent, its consequence.

4 SECOND ANTINOMY: THE CANCELLATION OF THE DRAP AS AN UNCODIFIED SANCTIONING MODALITY

4.1 THE DRAP: LEGAL NATURE AND FUNCTION IN THE REGISTRATION SYSTEM

The Statement of Party Acts Compliance (DRAP) is a procedural document that portrays, before the Electoral Justice, the regularity of the internal process of choosing candidacies by the party or federation. It is not a simple informative document: it is a complex legal act that materialises compliance with the statutory and legal rules on conventions, internal party decisions and composition of the slate, including compliance with the minimum percentage of candidacies of each gender (Article 10, § 3, of Law No. 9,504/1997). Submitted by the party or federation, its approval is a prior condition for the individual registration of candidacies (RRC), in the form of Article 11 of the same Law.

Understanding its nature is decisive for the second antinomy, given that it is an act whose legal ownership belongs to the party, and not to the candidate. The candidate is an indirect addressee, in a tiered relationship: first the party and formal conditions of the slate as a whole (DRAP) are approved and only afterwards the individual conditions of each candidate (RRC). It follows that the cancellation of the DRAP is, materially, a sanction directed at the party, although its immediate effects reach all the candidates of the slate, including

those whose RRC had been approved without any blemish. The DRAP functions as a systemic prerequisite of the collective registration and its cancellation removes the prerequisite, bringing about the collapse of the entire structure.

4.2 AIJE AND AIME: CONSTITUTIONAL AND LEGAL HYPOTHESES OF ADMISSIBILITY

The two electoral actions used as vehicles of the repression of gender quota fraud are the Electoral Judicial Investigation Action (AIJE) and the Action for the Annulment of Elective Mandate (AIME). It is necessary to examine, in some detail, the legal regime of each, so that the magnitude of the jurisprudential innovation may be understood.

The AIJE finds its legal basis in Article 22 of Complementary Law No. 64/1990, and has as its object, classically, three cores: (a) the abuse of economic power in the electoral process; (b) the abuse of political power or of authority to the detriment of electoral equality; and (c) the improper use of social communication media. The typical consequence of a successful AIJE claim, provided for in Article 22, item XIV, of Complementary Law No. 64/1990, is the cancellation of the registration or of the diploma of the beneficiary of the abuse and the declaration of ineligibility of those responsible for a period of eight years.

The AIME, in turn, has constitutional seating in Article 14, §§ 10 and 11, of the Federal Constitution, and has as its object, classically, three distinct cores: (a) the abuse of economic power — a core partially overlapping with that of the AIJE, with distinct consequences; (b) electoral corruption; and (c) fraud in the voting process.

Its typical consequence is the cancellation of the elective mandate, within a peremptory period of fifteen days counted from the certification. Traditionally, the fraud of the constitutional AIME was understood as fraud in the voting (manipulation of ballot boxes, falsification of ballots, illicit capture of suffrage). The extension of this fraud to reach fraud in the composition of the slate, that is, in the pre-electoral phase, was a progressive interpretative operation, today consolidated in the jurisprudence, but which, in the light of the constitutional text, is not trivial.

It should be noted that neither Article 22 of Complementary Law No. 64/1990 nor Article 14, § 10, of the Federal Constitution mention gender quota fraud, nor describe, as an object of either of the two actions, fraud in the composition of the slate, a category distinct from fraud in the voting and chronologically prior to the day of the poll. The construction that extends the admissibility of these actions to quota fraud is, therefore, interpretative, consolidated in successive judgments from 2015–2016 under the simple hermeneutic premise that all electoral fraud constitutes, in the final analysis, a species of abuse of power,

and the purpose of the AIJE would be the generic ascertainment of abuse, without limitation to the literal core of Article 22.

This premise, although defensible, expands, and does not merely apply, the legal type. To apply is to submit the facts to the pre-existing normative hypothesis. To expand is to construct, by interpretative means, a hypothesis that the legal text does not contemplate. The difference, in sanctioning law, is essential.

4.3 THE JURISPRUDENTIAL CONSTRUCTION OF THE CANCELLATION OF THE DRAP FOR QUOTA FRAUD

The cancellation of the DRAP as a consequence of gender quota fraud is not found in any provision of Law No. 9,504/1997, of Complementary Law No. 64/1990 or of the Electoral Code. It is, in its dogmatic origin and in its institutional development, a jurisprudential creation.

The Superior Electoral Court, in finding that the exhaustion of the fraud was located, materially, in the composition of the slate, shifted the object of the sanction from the individual (registration of candidacy) to the party act (DRAP).

The move was necessary at the material level, given that to punish only the fictitious candidate would be insufficient, for it would preserve the party scheme. To punish only the party without reaching the slate would be ineffective, for it would maintain the votes of the scheme. To reach only the leaders would leave the fraudulent act without immediate electoral repercussion. The jurisprudential engineering found, in the cancellation of the DRAP, the point of balance that allowed the production of a substantive electoral effect. But it is, at the formal level, an innovation upon the sanctioning system, and this innovation lacks legislative mediation.

The effects of the cancellation are multiple and grave, for the votes of all the candidates of the proportional slate are annulled, including those not involved in the scheme; the electoral and party quotients are recalculated, affecting the picture of the elected in other party associations of the constituency; and all those responsible are declared ineligible for eight years (Complementary Law No. 64/1990, Article 1, as amended by Complementary Law No. 135/2010). The combination of these effects may, in extreme hypotheses, reconfigure the political representation of an entire constituency.

4.4 LEGAL RESERVATION OF ELECTORAL SANCTIONS AND THE PRINCIPLE OF TYPICITY

The jurisprudential innovation finds a serious dogmatic obstacle in the principle of legal reservation of electoral sanctions. This principle, although not expressly enunciated by the

Federal Constitution in a formula analogous to that of Article 5, item XXXIX (which fixes the reservation of strict law for criminal matters), arises, according to the best doctrine, from the convergence of three constitutional sources: (a) from the nature of political rights as fundamental rights, in accordance with Article 14 et seq. of the Constitution; (b) from the requirement of typicity that governs all sanctioning law, in consonance with the substantive due process of Article 5, item LIV; and (c) from the express reservation of complementary law for the hypotheses of ineligibility, fixed in Article 14, § 9, of the Constitution. The combination of these three sources produces a requirement of strict legality, with material typicity, throughout the field of electoral sanctions.

Electoral sanctions (cancellation of registration, of diploma, of mandate, declaration of ineligibility) affect the core of political rights and must find their foundation in formal law (complementary law in the hypothesis of ineligibility, ordinary law in the case of cancellation of registration or diploma). The cancellation of the DRAP, to the extent that it produces equivalent material effects (collective annulment of candidacies, annulment of votes, recalculation of quotients) without express legal foundation, navigates in problematic terrain.

It is not denied that the constitutional electoral system admits interpretative constructions that expand the reach of the typical actions. It is denied, however, that this expansion can create an autonomous sanctioning modality, with its own effects that exceed the effects provided for the success of the original actions. The difference between broadly interpreting an existing sanction and creating a new sanction is precisely the difference between the lawful and the unlawful from the point of view of typicity.

When a classic AIJE (Article 22 of Complementary Law No. 64/1990) is upheld for abuse of economic power, the effects are exhaustively those provided for in law: cancellation of the registration or of the diploma of the beneficiary and ineligibility of the responsible person for eight years. When the AIJE is upheld for quota fraud, there are added the cancellation of the DRAP, the annulment of all votes of the slate (including those of the non-fraudsters) and the recalculation of the quotients with effects on third parties (none of these effects provided for in Article 22), in addition to ineligibility extended to subjects whose direct participation in the fraud is, at times, indirect.

The two sets are not equivalent, the second being broader, graver and more systemically disruptive. This expansion does not arise from an express legal provision, but from successive jurisprudential construction.

4.5 THE SYSTEMIC EFFECTS: BEYOND THE INFRINGING PARTY

The cancellation of the DRAP reaches agents who did not even participate in the fraud, and this extension is systemic, considering that candidates of the same slate who were unaware of the scheme and campaigned regularly lose their registration and votes without anything being able to be imputed to them. Likewise, parties of the same constituency, never called to the adversarial procedure, have their result altered by the recalculation of the quotients. Voters acting in good faith have their votes annulled by another's act and, furthermore, the very configuration of the proportional representation of the constituency may be substantially altered.

These effects are neither pathological nor do they arise from an error of application, but are inherent in the architecture chosen by the jurisprudence. There is no viable technical solution, in the current configuration, that preserves the useful effect of the sanction and simultaneously isolates the fraudulent agent, considering that if the fraudulent votes were not annulled, the scheme would be discouraged, but not undone. Hence the magnitude of the choice, necessary from the point of view of the useful effect, devastating from the point of view of the extension of the consequences upon third parties.

In the face of such a picture, the absence of a formal law that typifies the hypothesis and provides for the effects is particularly problematic. Today, questions of extreme material gravity are discussed without adequate legislative mediation; after all, does or does not the rule of Article 175, § 4, of the Electoral Code apply (utilisation of votes for the party) to cases of cancellation of the DRAP for quota fraud, with a jurisprudential tendency towards inapplicability, but divergent solutions among the Regional Electoral Courts? Does ineligibility reach the instrumentalised candidate, whom the more recent jurisprudence, in dialogue with Law No. 14,192/2021, tends to exclude, without an express legal rule? Does the recalculation produce retroactive effects on previous elections when the final judgment is delayed? All these questions, of extremely high material effects, are resolved today on a case-by-case basis, without a prior rule, without legal certainty and without rigorous isonomy between analogous situations.

The second antinomy, in synthesis, is the institutionalisation of an atypical sanctioning modality, necessary from the material point of view, atypical from the formal point of view, and generating systemic effects upon third parties who are not parties and who lack specific legislative regulation.

5 THIRD ANTINOMY: THE PASSIVE ILLEGITIMACY OF THE PARTY AND THE CANCELLATION OF THE DRAP

5.1 THE JURISPRUDENCE OF THE TSE ON PASSIVE STANDING IN AIJE

The third antinomy is, perhaps, the most paradoxical of the three. The consolidated jurisprudence of the Superior Electoral Court has established, in successive judgments, the understanding that the political party does not have standing to figure as a defendant in the AIJE. The foundation is doctrinally solid, considering that the AIJE, by its original procedural structure, aimed at the ascertainment of individual conduct that configures abuse of power or improper use of communication media, is directed against the person of the beneficiary of the abuse and against the agents who practised it.

The party, a legal person of private law with a special public function (Article 17 of the Federal Constitution), may act as plaintiff, complainant or opponent, but not as defendant in the procedural legal relationship of the classic AIJE, for the wrongdoing investigated there is, in its typical structure, a wrongdoing of individual conduct, and not an institutional wrongdoing.

The practical consequence is significant, given that in AIJEs for quota fraud, the defendant side is composed of the party leaders, the candidates of the slate in collusion and, in some hypotheses, the candidate identified as fictitious (whom the more recent tendency tends to exclude, under recognition of her condition as a victim).

The party, however, does not figure as a defendant, notwithstanding that it may be summoned, appear as an assistant or be informed of the acts, but does not formally integrate the contentious procedural relationship, with the range of guarantees that the position of defendant confers, such as full adversarial procedure, broad defence, autonomous production of evidence and own appeals.

5.2 THE DRAP AS A PARTY ACT: LEGAL OWNERSHIP

Here arises the logical contradiction that gives its name to the third antinomy. If the upheld AIJE produces, as its main effect, the cancellation of the DRAP, and if the DRAP is, as exposed, indisputably a party act, then the gravest sanction of the action reaches directly a subject that is not a party to the proceedings, that is, the one who could not fully defend himself is punished, and the act whose authorship materially belongs to the one who was kept outside the procedural relationship is cancelled.

The anomaly is not a mere operational deviation, but a structural consequence of the overlap between two regimes: the procedural one of the AIJE (which excludes the party) and the material one of the sanction (which punishes the party).

The objection could be set aside if it were maintained that the DRAP, although subscribed by the party, has the material ownership of the slate (the set of candidates). But the system of registration obstructs this reading, considering that the DRAP is submitted by the party as an act arising from the party convention, its regularity depends on internal party acts, and its irregularity compromises the entire proportional slate, and not only the individual registration of some candidate.

The system thus recognises the party nature of the act. If the act is party in its origin and the effects of the sanction reach it in its totality, the party is, at least materially, the central addressee of the sanction, even if the procedural form excludes it.

5.3 THE INCONGRUITY: PUNISHING THE ONE WHO CANNOT BE A PARTY

The incongruity is of a logical nature before being legal. In any minimally consistent sanctioning system, the sanction is directed at the one who is a party, and a party is the one who was summoned to integrate the procedural relationship with full possibility of defence. When the system admits that the sanction reaches a subject distinct from the procedural party, one is faced with an exception that needs to be, at a minimum, expressly provided for in law and surrounded by supplementary guarantees, notably the recognition, in some form, of the adversarial procedure of the material addressee of the sanction.

Contemporary procedural doctrine (Marinoni, Didier) has dedicated growing attention to the so-called substantial adversarial procedure, which goes beyond the mere formal hearing and requires effective influence over the formation of judicial conviction. In the light of this parameter, the position of the party in proceedings for quota fraud is particularly fragile.

In the case of quota fraud, however, neither one thing nor the other is verified. The hypothesis of cancellation of the DRAP to the detriment of a non-party party is not provided for in law, and the adversarial procedure of the party is, as a rule, oblique, exercised through the leaders who compose the defendant side, but without the party, as an autonomous legal person, formally integrating the procedural relationship.

The consequence is that an arrangement is constructed in which the party is, simultaneously, the holder of the cancelled act and a non-party to the proceedings. This functional duplicity, substantial ownership without procedural ownership, generates two relevant collateral effects. The first is the emptying of the adversarial procedure regarding the regularity of the DRAP, given that as the party is not a party, the defence of the party act depends on the interest and the capacity of the leaders to make it, without there being an institutional guarantee of the autonomous defence of the legal person. The second is the transformation of the party into an external addressee of the judicial decision, that is, a subject

who suffers the material effects without having been able to influence, formally and with full guarantees, its content.

5.4 ATTEMPTS AT RECONCILIATION AND THEIR INSUFFICIENCIES

Doctrine and jurisprudence have attempted to reconcile the contradiction by three avenues. The first maintains that the presence of the party leaders on the defendant side supplies, pragmatically, the adversarial procedure of the party, for it is they who deliberate for the party association and answer for it in court. The objection is evident, given that leaders may have interests divergent from those of the legal person they represent, for, in concrete hypotheses, they may minimise their individual liability at the cost of admitting institutional fraud, or transfer the liability to the party in order to isolate themselves. The coincidence between the defence of the leader and the defence of the party is not necessarily true, and the guarantee of one does not substitute that of the other.

The second avenue maintains that the cancellation of the DRAP, by reaching all the candidates of the slate, would guarantee the adversarial procedure through them, an argument that, in reality, further weakens the position of the legal person of the party. If the adversarial procedure of the party depends on the candidates considered individually, the institutional defence of the party association comes to depend on the interest and the capacity of these candidates to exercise a defence that, materially, is that of the party association. Moreover, the candidates may have no interest in defending the party act in its totality, possibly even preferring to demonstrate their personal dissociation from the fraudulent scheme, to the detriment of the defence of the party. The construction attributes to the third party the function of defending the holder, without the holder being able to exercise it in its own name.

The third avenue, finally, maintains that the inclusion of the order to cancel the DRAP in the requests of the initial pleading of the AIJE would, in itself, be sufficient to configure the adversarial procedure, it being enough for the plaintiff to formulate the request for the system to absorb the sanction as an admissible consequence of success.

This avenue is the most fragile of the three, given that it confuses the request with passive standing and ignores a basic premise of contemporary civil procedure, according to which the request is only effective against the one who is a party to the procedural relationship. The plaintiff may request whatever he wishes; the legal effectiveness of the request to the detriment of a given subject depends on the prior integration of that subject into the procedural relationship. To plead against the one who is not a party is to plead against the procedural void, with material effects that overflow the formal structure of the proceedings.

5.5 THE EMPTIED ADVERSARIAL PROCEDURE AND DUE PROCESS OF LAW

The synthesis of the three dogmatic antinomies is only completed in this third one, where the cancellation of the DRAP, today, is a sanction directed at a subject who is not a party to the proceedings. The fact that the party, materially, exercises its defence through its leaders does not resolve the formal legal question, only circumvents it.

The adversarial procedure, in substantive due process of law (Article 5, items LIV and LV, of the Constitution), is a structuring guarantee of the sanctioning system, and its emptying, even if partial and operationally compensated, compromises the formal legitimacy of the decision. It is not a matter, it is important to stress, of questioning the material justice of the decisions, considering that often, perhaps in most cases, the success of the AIJE for quota fraud is correct at the level of the facts. What is questioned is whether the procedural form adopted satisfies, at the level of institutional architecture, the constitutional requirements that govern any sanctioning system.

The interconnection of the three antinomies becomes, at this point, evident: the regulatory excess opens space for fraud to be typified by instruction, without legislative mediation and with the dispensation of an essential dogmatic element; the atypical sanction uses this administrative type as a vector for the cancellation of the DRAP, not provided for in law, with systemic effects on third parties who are not parties; and the passive illegitimacy reveals that this sanction is directed at a subject who cannot even be a party to the action that applies it.

The three, articulated, compose a system coherent in its practical application, but inconsistent in its formal structure, an inconsistency that, in the long run, tends to compromise the sustainability of the combat against fraud itself and that can only be fully overcome by legislative intervention.

6 FINAL CONSIDERATIONS

The three antinomies examined in this article: the excess of regulatory competence of the Superior Electoral Court, the jurisprudential creation of an uncoded sanctioning modality and the internal contradiction regarding the passive standing of the party, are not contingent pathologies of the current regime of repression of gender quota fraud. They are, rather, structural consequences of a prolonged legislative deficit, which the jurisprudence has supplied, at the material level, at the cost of formal tensions that today accumulate and which, articulated, compose a significant dogmatic challenge to the electoral sanctioning law system.

The jurisprudential construction of the regime, developed in José de Freitas/PI (REspe No. 1-49/PI, 2015), elaborated in Valença do Piauí (REspe No. 193-92/PI, 2019), refined in

Jacobina/BA, consolidated in Precedent No. 73 (2024), regulated by Resolution No. 23,735/2024, met a concrete and urgent need: to preserve the effectiveness of one of the most significant affirmative actions of Brazilian electoral law, against the systematic emptying that party engineering promoted from 2009.

To this legislative deficit is added an effect of a procedural order that merits registration: the prejudice to the jurisdiction itself. As the regime of repression of quota fraud was constructed on a regulatory and jurisprudential basis, and not on federal law in the strict sense, the party that intends to submit the controversy to the Superior Electoral Court by means of an electoral special appeal encounters a structural difficulty of admissibility.

The electoral special appeal presupposes, under the terms of Article 121, § 4, of the Federal Constitution and Article 276 of the Electoral Code, the contrariety to an express provision of the Constitution or of law; but, when the core of the wrongdoing and of its sanctioning consequences rests on a resolution of the Court itself and on a precedential statement, and not on a legal text, identifying the violated federal rule becomes an arduous task, when not impossible.

The consequence is paradoxical, given that the fragility of the legal basis, which is the core of the three antinomies examined, is also projected onto access to the special instance, restricting the appeal avenue through which the very interpretation of the regime could be standardised and controlled. The absence of a federal law to which a violation can be imputed, in the strict sense, thus operates in a double disadvantage, in that it weakens the material legitimacy of the sanction and narrows the channel of its jurisdictional review.

The material legitimacy of this trajectory is not questioned; on the contrary, its institutional indispensability is recognised. What is maintained, in this article, is that the normalisation of the regime, its consolidation in stable and legally consistent dogmatic forms, requires legislative intervention which the current state of affairs cannot continue to substitute indefinitely. The jurisprudential construction fulfilled its function of emergency response, and what is now demanded is the legislative consolidation of this arrangement, with the overcoming of the dogmatic tensions that the regulatory form cannot resolve.

Three normative propositions arise from the diagnosis presented in this article. The first is the express legal typification of gender quota fraud. The insertion, in Law No. 9,504/1997 — preferably in a specific provision, articulated with Article 10, § 3 — of a rule that describes the elements of the wrongdoing (including the eventual dispensation of the subjective element, if that is the option of the democratically legitimated legislator) would overcome the controversy regarding the limits of Article 105 and stabilise the regime at the level of strict legality. The legal rule could, moreover, confer on Precedent No. 73 a

retrospective legislative foundation, remedying the original fragility of the jurisprudential construction.

The second is the express legal provision of the cancellation of the DRAP as an autonomous sanctioning modality, with specific discipline regarding its effects. It would fall to the legislator to define: (a) the material hypotheses of admissibility; (b) the regime of annulment of the votes, that is, whether they reach the party or only the candidates considered individually; (c) the regime of recalculation of the quotients, with provision of the effects on third parties; (d) the regime of the consequent ineligibility, with individualisation of the subjects reached; and (e) the applicable procedural regime, including the procedural rite and the available appeals. The legal consolidation of these points would confer on the institute the typicity today absent, with a substantial gain in legal certainty.

The third is the express provision of the passive standing of the party in the actions that may culminate in the cancellation of the DRAP, with explicitation of the mechanisms of adversarial procedure, defence and individualisation of responsibilities. The inclusion of the party as a legitimate party, and not merely as an oblique addressee of the effects, would resolve the antinomy between material ownership and procedural exclusion, and would offer the legal person of the party the guarantees that its condition as addressee of the sanction requires. In dialogue with Law No. 14,192/2021, it would also fall to the legislator to regulate the position of the instrumentalised candidate, legally consecrating the jurisprudential tendency that recognises her as a victim of the wrongdoing.

Until this intervention exists, the combat against gender quota fraud will continue to depend, in its formal structure, on jurisprudential construction whose limits are continually strained with each new paradigmatic decision, with an accumulation of dogmatic fragilities that tend, over time, to compromise the very authority of the institutional response.

The function of this article does not consist in delegitimising the current regime, but in signalling its dogmatic tensions, a task that falls to the doctrine before falling to the jurisprudence or the legislator. It is in this spirit, that of one who recognises the relevance of the material programme of gender equality in politics and, precisely for this reason, is concerned with the dogmatic stability of its instrument of protection, that these reflections are offered.

ABSTRACT

This work addressed sustainable forest management (SFM) in the state of Acre and its purpose was to identify the cost of timber production coming from managed areas in that state. To this end, data were collected at four local logging firms. The results allowed us to conclude that: a) at a distance of 50 kilometres the timber arrived at the sawmill yard at a value of R\$346.64 per m³ for hardwood and R\$279.64 per m³ for white wood; b) forest exploitation presented itself as the most expensive stage of management; c) the cost of forest management tends to become cheaper on more distant lands, yet this does not compensate for the cost of transporting the timber to the sawmill yard; and d) there is nothing to reduce in the cost of management, therefore a better way to conduct the industrialisation processes must be identified, adding value to the product.

Keywords: Forest Management. Cost of Timber Production. Economic Forest-Sawmill Distance.

RESUMO

Este trabalho abordou o manejo florestal sustentável (MFS) no estado do Acre e o seu objetivo foi identificar o custo da produção madeireira oriunda de áreas manejadas nesse estado. Para tal, foram coletados dados em quatro firmas madeireiras locais. Os resultados permitiram concluir que: a) em uma distância de 50 quilômetros a madeira chegou ao pátio da serraria no valor de R\$346,64 m³ para madeira dura e R\$279,64 m³ para madeira branca; b) a exploração florestal apresentou-se como a etapa mais cara do manejo; c) o custo do manejo florestal tende a ficar mais barato em terras mais distantes, porém não compensa pelo valor do transporte da madeira até o pátio da serraria e d) não há o que reduzir no custo do manejo, sendo assim, deve-se identificar uma melhor forma de conduzir os processos de industrialização agregando valor ao produto.

RESUMEN

Este trabajo abordó el manejo forestal sostenible (MFS) en el estado de Acre y su objetivo fue identificar el costo de la producción maderera proveniente de áreas manejadas en ese estado. Para ello, se recolectaron datos en cuatro empresas madereras locales. Los resultados permitieron concluir que: a) a una distancia de 50 kilómetros la madera llegó al patio del aserradero por un valor de R\$346,64 m³ para madera dura y R\$279,64 m³ para madera blanca; b) la explotación forestal se presentó como la etapa más cara del manejo; c) el costo del manejo forestal tiende a abarataarse en tierras más distantes, pero no compensa por el valor del transporte de la madera hasta el patio del aserradero y d) no hay qué reducir en el costo del manejo, por lo tanto, se debe identificar una mejor forma de conducir los procesos de industrialización agregando valor al producto.

1 INTRODUCTION

The Brazilian Amazon holds one third of the world's tropical forests, with an estimated volume of 60 billion cubic metres of roundwood (BARROS; VERÍSSIMO, 2002) and performs incalculable ecological, sociocultural and economic functions, since it sustains the economy of entire regions (BARRETO *et al*, 2005).

It is appropriate to mention that, seeking the continuous use of forest resources, sustainable forest management was developed, the concept of SFM. This type of use of forest resources refers to the form of management of a forest in order to meet the needs of current and future generations, without compromising the ecological capacity and the renewal potential of this resource (WANG, 2004). The main obstacles to forest management are listed as the lack of basic and applied scientific research that guarantees the regeneration of the species extracted by selective logging and, above all, the high cost of its implementation (GARRIDO FILHA, 2002).

Silva *et al.* (2007) emphasise that high transport cost may render forest exploitation unfeasible in areas located far from consumption centres, since the timber industries consider forest exploitation to be the most expensive stage of management. Thus, it is valid to consider that timber is an input (or product) of low specific value, that is, its value in relation to its weight is low, which makes its transport cost high. In addition, variables such as the price of timber, costs of forest production, of the project, interest rate, lack of working capital, among others, affect the profitability of the forestry activity and, consequently, influence the quantification of the maximum feasible transport distance.

From the above, it is timely to carry out studies on the costs of forest production, including the items sustainable forest management, exploitation and industrial industrialisation. And it can be argued that the results of such research, having the state of Acre as a scenario, have the potential to support the development of public policies that promote the rational use of forests in this region. Such an assertion is based on the fact that currently this state has 95% of its exploited timber originating from management plans. Thus, this study had as its main objective to identify the cost of the timber activity, in managed areas, in the state of Acre.

2 MATERIAL AND METHODS

2.1 MATERIAL

Data collection took place through the application of a form in face-to-face interviews with members of the Acre timber sector, numbering four (two in the capital of Rio Branco, one in the municipality of Sena Madureira and one in the municipality of Feijó).

As proposed by Silva and Santos (2011), the aforementioned form focused on the themes: (1) identification of the firm; (2) characterisation of the Sustainable Forest Management Plan (PMFS) and its Annual Operating Plan (POA); (3) costs of planning and the opening of roads and branch trails (R\$/m³); (4) price paid for the exploited timber species (R\$/m³); (5) volume of exploited timber (m³) and (6) cost of the extraction and forest transport activities (R\$/m³).

2.2 METHODS

2.2.1 Cost of standing timber production

The cost of timber production was identified and quantified using the following mathematical model, developed by Silva and Santos (2011):

$$C_{mm} = S_{mp} + C_{mf} \quad (1)$$

Where C_{mm} = Cost of sustainable production of standing timber (R\$/m³); S_{mp} = Average price of standing timber in a deforestation area, and practised in Rio Branco (R\$/m³) and C_{mf} = Cost of SFM production (R\$/m³).

To quantify the cost of SFM production, as suggested by Klemperer (1996) and Wagner (2012), a cash flow was used which, applied to the concepts of financial mathematics, focused on a cutting-cycle period of 25 years with an interest rate of 6% per annum. In this calculation the following expression, presented by Silva and Santos (2011), was employed:

$$C_{sfm} = \frac{\sum_{t=0}^n \frac{C_t}{(1+i)^t}}{\frac{V_m}{(1+i)^{te}}} \quad (2)$$

Where C_{mf} = Cost of SFM (R\$/m³); C_t = Cost of SFM operations, in year t (R\$/ha); V_m = Volume of exploited timber (m³/ha); i = Interest rate, expressed as a decimal (0.0*i*); te = year in which exploitation occurred.

3 RESULTS AND DISCUSSION

The average values obtained on the characterisation of the PMFS and POA indicated that the commercial productivity of the forests exploited by these firms was 12 m³/ha. In turn, the price charged by the forest engineering firm to prepare and approve the PMFS was R\$80.00/ha.

The average prices found in Rio Branco for standing timber were R\$37.00/m³ for the white wood species and R\$55.00/m³ for the noble and hard species. As the hardwood and noble species had equal prices, they were considered to make up a single group, here called hardwood.

Table 1 lists the cost items of the harvesting/forest exploitation activities per m³ and costs with different freight charges (50 and 100 kilometres).

Table 1

Costs of the harvesting activity in sustainable forest management, state of Acre, 2014

Stages	Price (R\$/m ³)
Forest felling	8.67
Forest skidding	26.67
Road construction	13.50
First loading	7.80
Forwarding	10.00
Second loading	3.00
Miscellaneous costs	5.00
Opening of branch trail	45.00
Forest transport (50 km)	45.00
Forest transport (100 km)	70.00

Source: prepared by the authors.

Table 2

Costs of timber originating from a managed area, placed in the sawmill yard, state of Acre, year 2014

Item	Hardwood (R\$/m ³)	White wood (R\$/m ³)
SFM + standing tree (R\$/m ³)	182.00	115.00
Forest exploitation (R\$/m ³)	119.64	119.64
Transport (50 km*) (R\$/m ³)	45.00	45.00
Total (R\$/m ³)	346.64	279.64
SFM + standing tree (R\$/m ³)	135.00	89.00
Forest exploitation (R\$/m ³)	119.64	119.64
Transport (100 km*) (R\$/m ³)	70.00	70.00
Total (R\$/m ³)	324.64	278.64

Source: prepared by the authors.

Note: (*) distance, forest-yard of the timber firm.

The cost of forest management has an inverse relationship to distance (transport of the timber). This happens because the cost of management considers the value of the cubic

metre of the standing tree, and this tends to become cheaper as the land becomes farther from the commercial centre. Considering an economic radius of 50 kilometres, it could be stated that the cubic metre of hardwood arrived at the sawmill yard at a value of R\$346.64/m³ and R\$279.64/m³ for white wood. For 100 kilometres this value decreased by about 7% for hardwood and 0.40% for white wood.

The values of the standing tree and of the log placed in the yard found in this study were considered high when compared to the values found by the study of the Instituto do Homem e Meio Ambiente da Amazônia – IMAZON in Belém do Pará in the year 2010, considered the cheapest cubic metre of the Amazon because it was exploited over great distances (688 kilometres) and transported by means of barges (fluvial transport).

4 CONCLUSIONS

From the results generated in this economic evaluation of corporate forest management, it was possible to infer the following points:

- a) The cost of exploiting roundwood is the most expensive stage of forest management;
- b) The cost of forest management tends to become cheaper on more distant lands, yet this does not compensate due to the fact that the value of the freight of the timber to the timber yard becomes more expensive;
- c) The cost of SFM is already at the limit, there is nothing to reduce. Therefore, a better way to conduct the industrialisation processes must be identified and value added to the product.

ABSTRACT

Benthic macrofauna; including mollusks, crustaceans, and polychaetes; plays a crucial role in regulating biogeochemical cycles, stabilizing sediments, and maintaining aquatic ecosystem resilience. Owing to their high sensitivity to environmental perturbations, these organisms are extensively used as bioindicators in ecological monitoring and impact assessments. Nevertheless, their traditional identification and enumeration rely on manual, labor-intensive procedures that demand taxonomic expertise and are susceptible to subjectivity and human error. To overcome these limitations, this study presents a robust and fully automated system based on Convolutional Neural Networks (CNNs) for the detection and quantification of benthic macrofauna from digital microscopy images. The proposed workflow encompasses standardized image acquisition, taxonomic annotation, advanced pre-processing, data augmentation, and supervised deep learning model training implemented in Python. Evaluation of the system revealed a mean F1-score of 0.93, mAP50 of 0.939, and inference times below 10 milliseconds per image, while maintaining stable validation precision, recall, and mAP values throughout training. Moreover, precision and recall metrics remained consistently high across diverse taxa, and the mean Average Precision (mAP50 and mAP50–95) improved steadily during training. These outcomes confirm the system's high generalization capacity and computational efficiency, enabling rapid, reliable, and reproducible ecological data generation. Beyond technical performance, the solution supports scalable biodiversity assessments, strategic environmental decision-making, and the optimization of conservation efforts, particularly in the face of climate change. This integration of artificial intelligence with benthic ecology represents a significant advancement in digital environmental monitoring, offering a cost-effective, time-efficient, and scientifically rigorous alternative to conventional analytical methods.

manutenção da resiliência dos ecossistemas aquáticos. Devido à sua elevada sensibilidade às perturbações ambientais, esses organismos são amplamente utilizados como bioindicadores no monitoramento ecológico e em avaliações de impacto. Contudo, sua identificação e contagem tradicionais dependem de procedimentos manuais e laboriosos que exigem expertise taxonômica e são suscetíveis à subjetividade e ao erro humano. Para superar essas limitações, este estudo apresenta um sistema robusto e totalmente automatizado baseado em Redes Neurais Convolucionais (CNNs) para a detecção e quantificação da macrofauna bentônica a partir de imagens de microscopia digital. O fluxo de trabalho proposto abrange aquisição padronizada de imagens, anotação taxonômica, pré-processamento avançado, aumento de dados e treinamento supervisionado de modelos de aprendizado profundo implementado em Python. A avaliação do sistema revelou um F1-score médio de 0,93, mAP50 de 0,939 e tempos de inferência inferiores a 10 milissegundos por imagem, mantendo valores estáveis de precisão, revocação e mAP de validação ao longo do treinamento. Além disso, as métricas de precisão e revocação permaneceram consistentemente elevadas entre diversos táxons, e a precisão média (mAP50 e mAP50–95) melhorou de forma constante durante o treinamento. Esses resultados confirmam a alta capacidade de generalização e a eficiência computacional do sistema, possibilitando a geração rápida, confiável e reprodutível de dados ecológicos. Além do desempenho técnico, a solução apoia avaliações escaláveis de biodiversidade, a tomada de decisão ambiental estratégica e a otimização dos esforços de conservação, particularmente diante das mudanças climáticas. Essa integração da inteligência artificial com a ecologia bentônica representa um avanço significativo no monitoramento ambiental digital, oferecendo uma alternativa econômica, eficiente em tempo e cientificamente rigorosa aos métodos analíticos convencionais.

RESUMEN

La macrofauna bentónica, incluyendo moluscos, crustáceos y poliquetos, desempeña un papel crucial en la regulación de los ciclos biogeoquímicos, la estabilización de los sedimentos y el mantenimiento de la resiliencia de los ecosistemas acuáticos. Debido a su alta sensibilidad a las perturbaciones ambientales, estos organismos se utilizan ampliamente como bioindicadores en el monitoreo ecológico y en las evaluaciones de impacto. No obstante, su identificación y enumeración tradicionales dependen de procedimientos manuales y laboriosos que exigen experiencia taxonómica y son susceptibles a la subjetividad y al error humano. Para superar estas limitaciones, este estudio presenta un sistema robusto y totalmente automatizado basado en Redes Neuronales Convolucionales (CNNs) para la detección y cuantificación de la macrofauna bentónica a partir de imágenes de microscopía digital. El flujo de trabajo propuesto abarca la adquisición estandarizada de imágenes, la anotación taxonómica, el preprocesamiento avanzado, el aumento de datos y el entrenamiento supervisado de modelos de aprendizaje profundo implementado en Python. La evaluación del sistema reveló un F1-score medio de 0,93, mAP50 de 0,939 y tiempos de inferencia inferiores a 10 milisegundos por imagen, manteniendo valores estables de precisión, exhaustividad y mAP de validación a lo largo del entrenamiento. Además, las métricas de precisión y exhaustividad se mantuvieron consistentemente altas entre diversos taxones, y la precisión media (mAP50 y mAP50–95) mejoró de forma constante durante el entrenamiento. Estos resultados confirman la alta capacidad de generalización y la eficiencia computacional del sistema, permitiendo la generación rápida, confiable y reproducible de datos ecológicos. Más allá del desempeño técnico, la solución apoya evaluaciones escalables de biodiversidad, la toma de decisiones ambientales estratégicas y la optimización de los esfuerzos de conservación, particularmente frente al cambio climático. Esta integración de la inteligencia artificial con la ecología bentónica representa un avance

significativo en el monitoreo ambiental digital, ofreciendo una alternativa rentable, eficiente en tiempo y científicamente rigurosa a los métodos analíticos convencionales.

1 INTRODUCTION

Aquatic ecosystems depend critically on benthic macrofauna, a diverse assemblage of invertebrates including mollusks, crustaceans, polychaetes, and echinoderms, to sustain fundamental ecological processes. Occupying the sediment-water interface, these organisms drive biogeochemical cycles such as organic matter decomposition, nutrient regeneration, and sediment oxygenation, while simultaneously serving as sensitive bioindicators of environmental quality (Avelino *et al.*, 2023; Kuhlmann, 2022; Hale *et al.*, 2024). Their intimate association with the substrate and low dispersal capacity make them particularly responsive to variations in sediment composition, oxygen availability, temperature, pH, and contaminant loadings, rendering them indispensable tools for ecological monitoring in estuarine, coastal, and lagoon ecosystems (Sousa *et al.*, 2023; Moura *et al.*, 2023).

Maintaining the ecological integrity of lagoon systems requires continuous monitoring of benthic communities, as these organisms mediate essential biogeochemical functions including nutrient cycling, pollutant filtration, and sediment stabilization. Their spatial distribution and abundance patterns reliably reflect environmental impacts associated with pollution gradients, granulometric shifts, and anthropogenic disturbances such as bottom trawling (Li *et al.*, 2022; Bradshaw *et al.*, 2024). Standard benthic sampling protocols involve the selection of georeferenced stations across environmental gradients, with multiple replicates per point to ensure statistical reliability. Sample recovery is typically performed using corers, dredges, or nets, followed by sieving, fixation in ethanol, and taxonomic sorting under stereomicroscopy (Kuhlmann, 2022; Pardo *et al.*, 2023).

Laboratory processing of benthic samples relies on stereomicroscopic examination combined with dichotomous identification keys to classify organisms into functional groups. Ecological quality is subsequently assessed through biological indices that integrate species diversity, abundance, and dominance, enabling spatial and temporal comparisons across monitoring programs (Sun *et al.*, 2021; Han *et al.*, 2021). Although scientifically rigorous, this workflow is time-consuming, operator-dependent, and demands highly specialized taxonomic expertise, constraints that severely limit the scale and frequency of monitoring campaigns and hinder timely responses to environmental degradation (Ghimire *et al.*, 2021; Neves and Valentin, 2011).

Computer vision based on Convolutional Neural Networks (CNNs) has emerged as a transformative solution to automate image-based biodiversity assessments. By learning hierarchical spatial representations directly from labeled images, CNNs can distinguish morphologically similar taxa with high accuracy, even under variable lighting and background conditions (Villon *et al.*, 2018; Xu *et al.*, 2020; Zhu *et al.*, 2021). Their capacity to process

thousands of images per hour, with inference times below 10 milliseconds, makes them particularly well-suited for high-throughput ecological screening. Deep learning frameworks such as PyTorch and TensorFlow have further democratized access to these architectures, enabling their deployment in research and regulatory monitoring contexts (LeCun *et al.*, 2015; Krizhevsky *et al.*, 2012).

Despite this growing adoption across aquatic sciences, targeted applications of CNNs to benthic macrofauna in lagoon environments remain scarce. Existing models have largely focused on planktonic organisms, coral reefs, and fish assemblages (Ferreira *et al.*, 2022; Mizuno *et al.*, 2024), leaving a critical methodological gap for sediment-dwelling invertebrates. The morphological complexity of benthic taxa, characterized by appendage segmentation, shell curvature, body transparency, and sediment adhesion, demands specialized training datasets, tailored augmentation strategies, and robust image processing pipelines to achieve reliable classification under real ecological conditions.

Addressing this gap is particularly urgent given the accelerating pace of global environmental change. Lagoon and estuarine systems are among the ecosystems most vulnerable to sea-level rise, ocean acidification, eutrophication, and hypoxic events (IPCC, 2023; Duarte *et al.*, 2013). Benthic macrofauna, by virtue of their sedentary lifestyle and narrow physiological tolerance, function as early-warning sentinels of these stressors. Automating their identification and quantification substantially expands the temporal and spatial resolution of biodiversity data, enabling the detection of ecological imbalances and long-term community shifts that would otherwise go undetected (Borja *et al.*, 2010; McLeod *et al.*, 2011).

Beyond ecological monitoring, this research carries strategic implications for climate adaptation governance and blue carbon policy. Continuous, high-frequency benthic data support environmental licensing processes, certification of blue carbon projects, and the construction of long-term biodiversity indicators aligned with the Sustainable Development Goals (SDGs) and the Convention on Biological Diversity (CBD). The preservation of macrofaunal integrity underpins ecosystem services, sediment stabilization, nutrient cycling, and carbon sequestration, that are central to coastal resilience frameworks (Barbier *et al.*, 2011; Howard *et al.*, 2017; UNEP, 2021).

This study presents the development, training, and validation of a CNN-based automated system for the identification and enumeration of benthic macrofauna from digital microscopy images. The proposed pipeline integrates standardized image acquisition, manual taxonomic annotation, data augmentation, and supervised model training in Python. Model performance is evaluated through accuracy, F1-score, recall, and mean Average

Precision (mAP), ensuring practical applicability for large-scale ecological monitoring. The novelty of this work lies in adapting CNN architectures to the specific morphological and imaging challenges of benthic macrofauna, with direct implications for accelerating biodiversity assessments and strengthening evidence-based environmental decision-making.

Although recent advances in artificial intelligence have substantially expanded the use of deep learning techniques in ecological monitoring, applications focused on benthic macrofauna remain limited, particularly in lagoon ecosystems. Most existing studies have concentrated on fish assemblages, coral reefs, plankton communities, or broad marine biodiversity assessments, leaving a significant methodological gap regarding sediment-associated invertebrates. Furthermore, few studies have explored the integration of automated benthic monitoring with environmental governance and strategic decision-making frameworks (Zang *et al.*, 2019). Consequently, there is a growing need for intelligent and scalable solutions capable of accelerating laboratory screening procedures while simultaneously generating reliable ecological indicators to support environmental management and climate adaptation policies.

2 MATERIALS AND METHODS

2.1 STUDY AREA AND SAMPLING PROCEDURES

The study was conducted in the Maricá Lagoon, a hypersaline coastal lagoon situated in the state of Rio de Janeiro, southeastern Brazil. Embedded within a broader complex of Atlantic-domain coastal lagoons, this system is characterized by pronounced environmental heterogeneity, including gradients of salinity, tidal exchange, sediment composition, and organic matter concentration driven by both natural dynamics and anthropogenic pressures such as urban runoff and shoreline modification. These features make it an ecologically sensitive and scientifically valuable site for investigating the spatial distribution and community structure of benthic macrofauna.

Sampling stations were selected based on stratified environmental gradients encompassing proximity to urban discharge points, sediment type, and vegetation cover, with logistical constraints of accessibility and safety also considered. This stratification aimed to ensure spatial representation across distinct ecological zones and to capture the full range of benthic community variability within the lagoon system.

Field campaigns were conducted during both the dry and rainy seasons to account for temporal variability associated with freshwater inflows and precipitation. Surface sediments were collected using a cylindrical corer (10 cm diameter, 15 cm penetration depth), targeting

the uppermost sediment horizon where macroinvertebrate abundance is highest. At each of the 30 georeferenced stations, three replicate cores were obtained ($n = 90$ total), and the material was immediately sieved through a 500 μm mesh in the field to remove excess sediment and retain macrofauna.

Retained organisms were preserved in 70% ethanol and transported to the laboratory, where specimens were sorted under a stereomicroscope and prepared for imaging and taxonomic classification. The focal taxa; polychaetes, amphipods, and gastropods; were selected for their ecological relevance as bioindicators of sediment quality and their representation across the sampled environmental gradients.

2.2 IMAGE ACQUISITION AND ANNOTATION

High-resolution digital images were obtained from each biological sample using a digital microscope equipped with adjustable LED lighting and a uniform background substrate. Image capture followed a standardized protocol to ensure consistent illumination, magnification, and contrast across all samples, thereby minimizing sources of technical variability in the training dataset. Each specimen was individually positioned and photographed under controlled conditions.

All images were manually annotated using bounding boxes to delimit and taxonomically classify each visible organism, generating a structured labeled dataset suitable for supervised object detection training. The species included in the training set were *Heliobia* spp., *Streblospio* sp., and *Cassidinidea fluminensis*. To reflect differences in acquisition conditions, three imaging subsets were defined: *Heliobia*N (specimens photographed under normal magnification without microscopy), *Heliobia*M (specimens imaged with one microscope configuration), and *Heliobia*M1 (specimens imaged with an alternative microscope setup). The remaining taxa were annotated exclusively from one microscopy modality.

2.3 MODEL ARCHITECTURE AND TRAINING STRATEGY

The annotated image dataset was partitioned into training (80%) and validation (20%) subsets using stratified sampling to preserve class proportions across splits. To enhance model generalizability and mitigate overfitting, data augmentation was applied during training, including horizontal and vertical flipping, brightness and contrast perturbations, and zoom transformations. The full pipeline was implemented using a supervised deep learning framework in Python.

The network architecture followed a convolutional design comprising successive feature extraction stages. Convolutional layers captured low- and mid-level spatial features; edges, textures, and morphological patterns; while max-pooling layers progressively reduced spatial dimensionality. Batch normalization was applied after each convolutional block to stabilize gradient flow and accelerate convergence. Fully connected layers at the output stage integrated the learned feature representations to generate species-level classifications via a softmax activation function.

Model training was guided by a composite loss function combining three terms: a bounding box localization loss (L_{box}), a cross-entropy classification loss (L_{cls}), and a Distribution Focal Loss (L_{dfl}) that assigns greater weight to difficult instances. The total loss is expressed as:

$$L_{\text{total}} = L_{\text{box}} + L_{\text{cls}} + L_{\text{dfl}} \quad (1)$$

The localization loss penalizes spatial misalignment between predicted and ground-truth bounding boxes:

$$L_{\text{box}} = \sum_{i=1}^N \delta_i \cdot \text{IoU}_{\text{loss}}(\hat{b}_i, b_i) \quad (2)$$

where N is the total number of predicted objects; $\delta_i \in \{0, 1\}$ indicates whether prediction i constitutes a valid match; $\hat{b}_i$ and b_i are the predicted and ground-truth bounding boxes, respectively; and IoU_{loss} can be instantiated as GloU , DloU , or CloU to penalize poor localization alignment.

The classification loss minimizes the cross-entropy between predicted probabilities and true taxonomic labels:

$$L_{\text{cls}} = -\sum_{i=1}^N \sum_{c=1}^C y_{i,c} \cdot \log(\hat{p}_{i,c}) \quad (3)$$

where C is the number of classes; $y_{i,c} \in \{0, 1\}$ is the ground-truth label for instance i and class c ; and $\hat{p}_{i,c}$ is the predicted softmax probability for that class.

The Distribution Focal Loss refines bounding box regression by concentrating learning on harder examples:

$$L_{\text{dfl}} = -\sum_{i=1}^N \sum_{j=1}^M w_{i,j} \cdot \log(p_{i,j}) \quad (4)$$

where M is the number of discrete regression bins; $w_{i,j}$ is the target-distribution weight for bin j of instance i ; and $p_{i,j}$ is the predicted probability for that bin.

Training was performed using stochastic gradient descent with adaptive learning rate scheduling and early stopping criteria. The final model checkpoint was selected based on the highest $mAP@50$ achieved on the validation set. All computations were executed on a workstation equipped with an NVIDIA RTX 3060 GPU.

2.4 EVALUATION METRICS AND PERFORMANCE ANALYSIS

Model performance was assessed using a multi-metric framework combining standard classification and object detection indicators, computed at both per-class and aggregate levels to characterize overall and class-specific behavior.

Precision quantifies the proportion of detections that are truly positive among all detections made by the model:

$$\text{Precision} = \frac{TP}{TP + FP} \quad (5)$$

Recall measures the proportion of actual positive instances that the model successfully detected:

$$\text{Recall} = \frac{TP}{TP + FN} \quad (6)$$

The F1-Score provides the harmonic mean of precision and recall, offering a balanced evaluation that accounts for both false positives and false negatives:

$$F_1 = 2 \cdot \frac{\text{Precision} \cdot \text{Recall}}{\text{Precision} + \text{Recall}} \quad (7)$$

The mean Average Precision at $IoU \geq 0.50$ ($mAP@50$) summarizes detection performance across all classes at a standard localization threshold:

$$mAP@50 = \frac{1}{M} \sum_{i=1}^M \int_0^1 p_i(r) dr \quad (8)$$

where M is the number of classes and $p_i(r)$ denotes the precision–recall function for class i , with the integral computing the area under that curve at $IoU = 0.50$.

To provide a stricter and more comprehensive localization assessment, the mAP@50:95 metric averages detection performance across ten IoU thresholds from 0.50 to 0.95 in 0.05 increments:

$$\text{mAP@50:95} = \frac{1}{T} \sum_{t=1}^T \left[\frac{1}{M} \sum_{i=1}^M \int_0^1 p_{i,t}(r) dr \right] \quad (9)$$

where $T = 10$ is the number of thresholds and $p_{i,t}(r)$ is the precision–recall curve for class i at threshold t . Inference time per image was additionally recorded to evaluate real-time applicability in laboratory workflows.

2.5 POST-PROCESSING METRICS AND CONFIDENCE EVALUATION

Detection confidence scores were derived from the classification probability output of the final prediction layer, yielding a probability estimate over the K taxonomic classes. A prediction was considered valid only if its confidence score exceeded an empirically defined threshold (typically 0.25–0.50), thereby balancing sensitivity to low-abundance taxa against the suppression of false positives.

Overall classification accuracy was computed as:

$$\text{Accuracy} = \frac{\text{TP} + \text{TN}}{\text{TP} + \text{TN} + \text{FP} + \text{FN}} \quad (10)$$

where TP, TN, FP, and FN denote true positives, true negatives, false positives, and false negatives, respectively. This metric captures the proportion of all predictions — both presences and absences — that were correctly classified.

The confidence score C for a given input x is formally defined as the maximum softmax probability across all classes:

$$C = \max_{k \in \{1, \dots, K\}} P(y = k \mid x) \quad (11)$$

where $P(y = k \mid x)$ is the model's estimated probability that input x belongs to class k , and the max operator identifies the most likely taxonomic assignment. Confidence intervals for precision and accuracy estimates were determined through bootstrapping on validation subsets to ensure statistical robustness of reported performance values.

2.6 JUSTIFICATION OF METRIC SELECTION

The adoption of a multi-metric evaluation framework is warranted by the ecological complexity inherent to benthic monitoring. In conservation contexts, false negatives, undetected species, may result in the overlooking of rare or functionally critical taxa, whereas false positives risk inflating biodiversity assessments and misguiding management decisions. Precision and recall directly quantify these error types and are therefore indispensable for ecologically valid performance reporting.

The mAP metrics extend evaluation to the spatial domain, assessing the accuracy with which the model localizes each specimen within the image. This is especially important for small, partially occluded, or morphologically convergent organisms that are common in complex sediment samples. The combined use of classification and localization metrics ensures that the system meets the dual requirements of taxonomic accuracy and spatial precision demanded by environmental monitoring applications.

Confidence thresholds and inference time metrics further provide the operational parameters needed for scaling the system to automated laboratory pipelines and mobile field stations, where processing speed and prediction reliability are equally critical considerations. Together, these indicators constitute a comprehensive and ecologically grounded evaluation standard aligned with both scientific best practices and regulatory monitoring requirements.

3 RESULTS

This section provides a comprehensive evaluation of the CNN model developed for the automated identification and enumeration of benthic macrofauna. The assessment encompasses quantitative performance metrics; precision, recall, F1-score, and mean Average Precision; alongside an examination of training dynamics, confusion matrices, and detection examples. Taken together, these elements characterize the model's predictive capacity, operational reliability, and readiness for integration into ecological monitoring workflows.

3.1 CNN MODEL PERFORMANCE

The training dataset comprised 219 digital microscopy images of varying resolution, encompassing both single-species and multi-species compositions. Of these, 133 images were allocated to training and 86 to validation. The model was trained in a Python 3.9.13 environment with CUDA GPU acceleration (Torch 2.5.1) on an NVIDIA RTX 3060. The final architecture consisted of 168 layers and 11,128,293 parameters, operating at 28.5 GFLOPs,

a moderately complex configuration well-suited to the scale of the dataset. Figure 1 summarizes the key output parameters recorded at the conclusion of training.

Figure 1

Final training output parameters

Epoch	GPU_mem	box_loss	cls_loss	dfl_loss	Instances	Size			
200/200	3.89G	0.3846	0.2305	0.8446	41	640: 100%	9/9	[00:02<00:00, 4.14it/s]	
Class	Class	Images	Instances	Box(P	R	mAP50	mAP50-95)	100%	3/3 [00:00<00:00, 4.20it/s]
all		86	706	0.946	0.899	0.934	0.676		

Source: author.

Validation was performed over 86 images containing 706 annotated instances distributed across five taxonomic classes. Among individual classes, HeliobiaN achieved a precision of 0.977, recall of 0.960, mAP50 of 0.939, and mAP50–95 of 0.522. HeliobiaM recorded precision of 0.968, recall of 0.786, mAP50 of 0.847, and mAP50–95 of 0.737. HeliobiaM1 attained precision of 0.931, recall of 0.973, mAP50 of 0.948, and mAP50–95 of 0.742. Streblospio_spM yielded precision of 0.937 and recall of 0.817, with mAP50 of 0.916 and mAP50–95 of 0.585. The highest overall performance was recorded for Cassid_Flum, which achieved a precision of 0.961, perfect recall of 1.000, mAP50 of 0.995, and mAP50–95 of 0.847. Although Cassid_Flum achieved the highest performance metrics, these results should be interpreted with caution due to the limited number of validation instances available for this class.

Across all classes, the model attained a mean mAP50 of 0.939 and an overall F1-score of 0.93, confirming strong classification capacity. The mAP50–95 of 0.687 indicates that while localization at standard thresholds is robust, performance at stricter IoU criteria leaves room for improvement, a limitation primarily attributable to the limited size of the current dataset, for which expansion is recommended. Inference was computationally efficient: pre-processing required 0.3 ms, inference 6.9 ms, and post-processing 0.8 ms per image, demonstrating suitability for real-time laboratory screening. Figure 2 presents the confusion matrices for the trained model.

Figure 2

Confusion matrix: (a) absolute counts, (b) normalized by class

Class	Images	Instances	Box(P	R	mAP50	mAP50-95)
all	86	706	0.955	0.907	0.939	0.687
HeliobiaN	5	50	0.977	0.96	0.99	0.522
HeliobiaM	10	76	0.968	0.786	0.847	0.737
HeliobiaM1	38	429	0.931	0.973	0.948	0.742
Streblospio_spM	38	145	0.937	0.817	0.916	0.585
Cassid_Flum	3	6	0.961	1	0.995	0.847

Source: author.

The absolute confusion matrix confirms concentrated correct predictions along the main diagonal: 49 instances for HeliobiaN, 61 for HeliobiaM, 419 for HeliobiaM1, 123 for Streblospio_spM, and 6 for Cassid_Flum. The normalized matrix reveals per-class accuracy rates of 0.98 for HeliobiaN, 0.80 for HeliobiaM, 0.98 for HeliobiaM1, 0.85 for Streblospio_spM, and 1.00 for Cassid_Flum. The confusion between HeliobiaM and HeliobiaM1 suggests that differences introduced by microscope configuration may have affected class separability. Moreover, the presence of false negatives classified as background, particularly for Streblospio_spM, indicates that small or partially overlapping organisms remain challenging for the model. These findings reinforce the importance of image standardization and dataset expansion to improve detection robustness. The comparatively lower recall of HeliobiaM (0.80) likely reflects imaging inconsistencies between the two microscope configurations used for that class, reinforcing the need for standardized acquisition protocols. Figure 3 presents the key performance curves.

Figure 3

Performance metrics: F1-Confidence (a), Precision–Confidence (b), Precision–Recall (c), and Recall–Confidence (d)

Source: author.

The F1-Confidence curve stabilizes at 0.93 at a confidence threshold of 0.625, reflecting a well-balanced trade-off between precision and recall across the operating range.

The Precision-Confidence curve demonstrates that precision reaches 1.00 at a threshold of 0.98, indicating that highly confident predictions are almost exclusively correct, a desirable property for applications where taxonomic misidentification carries regulatory consequences. The Precision-Recall curve shows that a mean average precision of 0.939 is maintained up to recall levels of 0.5, representing an optimal generalization regime. At higher recall levels, precision decreases for some classes, particularly *Streblospio_spM*, suggesting that conservative thresholding may be preferable in surveys targeting rare taxa. The Recall-Confidence curve confirms that high recall is sustained at low confidence thresholds and degrades progressively as the threshold is raised, a trade-off inherent to all detection systems. Figure 4 presents the full training and validation learning curves.

Figure 4

Training and validation loss, precision, recall, and mAP curves across 200 epochs

Source: author.

The training loss components (box, classification, and DFL) decreased consistently throughout the 200 training epochs, indicating progressive optimization of model parameters. In the validation set, classification loss decreased and stabilized, while box loss remained relatively stable after the initial training stages. The validation DFL loss exhibited a slight increase during later epochs, suggesting that bounding-box refinement may still benefit from a larger and more diverse dataset. Nevertheless, precision, recall, mAP50, and mAP50–95

remained stable or improved during training, indicating satisfactory generalization to unseen data. These results are comparable to, and in some cases exceed, those reported in previous ecological monitoring studies employing deep learning techniques. Villon *et al.* (2018) demonstrated the feasibility of applying deep learning techniques to underwater species classification, while Zhu *et al.* (2021) highlighted the challenges associated with maintaining high precision when dealing with morphologically similar taxa., while Zhu *et al.* (2021) highlighted the difficulty of maintaining high precision when dealing with morphologically similar taxa. The F1-score of 0.93 obtained in the present study therefore demonstrates that CNN-based approaches can achieve robust performance even when applied to small benthic invertebrates exhibiting substantial morphological variability.

3.2 AUTOMATED DETECTION AND COUNTING RESULTS

The automated detection system demonstrated strong performance across speed, taxonomic accuracy, and generalization, even given the relatively small and heterogeneous image dataset spanning both microscopy and non-microscopy acquisition conditions. The mean inference time of under 10 ms per image supports real-time integration into laboratory triage workflows, substantially reducing the time burden of manual screening. Figures 5 through 9 illustrate representative detection outputs alongside manual reference counts for each taxonomic class.

Figure 8

Detection output and confidence statistics: Streblospio_spM (microscopy, mixed sample). 100% accuracy in species identification and approximately 45% accuracy in specimen counting

Source: author.

Figure 9

Detection output and confidence statistics: HeliobiaM1 and Streblospio_spM (microscopy, mixed sample). 100% correct species identification and counting

Source: author.

Automated counts matched manual reference counts within a 5% error margin for correctly classified instances. Deviations were predominantly associated with low-image-

quality samples and overlapping specimens, two conditions that degrade bounding box discrimination and inflate both false positive and false negative rates. These findings underscore the importance of image acquisition standardization and point toward dataset expansion, particularly for underrepresented classes and challenging imaging scenarios, as the primary avenue for further performance improvement.

The system's alignment with Industry 4.0 principles enables its integration into continuous ecological monitoring architectures, supporting automated data pipelines, anomaly detection, and decision support interfaces. This capability represents a substantive shift from reactive, sample-driven monitoring toward proactive, data-continuous surveillance of benthic community dynamics.

3.3 COMPARISON WITH TRADITIONAL LABORATORY SCREENING

Traditional benthic macrofauna screening relies on manual identification and counting performed by trained taxonomists under stereomicroscopes. Although processing times vary according to sample complexity, manual laboratory screening typically requires several minutes to hours per sample, whereas the proposed CNN performs image inference in less than 10 ms, representing a substantial increase in analytical throughput.

Considering that a single laboratory sample may contain dozens to hundreds of individuals requiring manual sorting and identification, the computational efficiency achieved by the proposed model represents a substantial reduction in processing time and human effort. This gain becomes particularly relevant in long-term monitoring programs involving large numbers of samples and repeated surveys.

Beyond speed, automated screening contributes to process standardization by reducing operator-dependent variability, which is a common source of inconsistency in ecological assessments. While expert validation remains essential, particularly for rare or morphologically similar taxa, the proposed approach significantly reduces the workload associated with routine laboratory procedures.

These findings indicate that artificial intelligence can serve as a complementary tool for benthic monitoring programs, increasing analytical throughput while preserving acceptable levels of taxonomic accuracy and reproducibility.

3.4 IMPLICATIONS FOR ENVIRONMENTAL GOVERNANCE

The proposed system extends beyond a purely technological contribution and presents important implications for environmental governance. By enabling faster and more frequent assessments of benthic communities, the approach facilitates the generation of

continuous ecological indicators that can support environmental licensing, biodiversity monitoring programs, and adaptive management strategies.

Because benthic macrofauna are highly sensitive to environmental disturbances, automated monitoring systems can function as early-warning tools for detecting ecological degradation associated with pollution, eutrophication, habitat alteration, and climate-related stressors. The availability of standardized and reproducible biodiversity information strengthens evidence-based decision-making and contributes to more transparent environmental management processes.

Furthermore, the integration of artificial intelligence into environmental monitoring frameworks aligns with current global initiatives related to ecosystem conservation, climate adaptation, blue carbon programs, and sustainability governance. As environmental datasets become increasingly complex and voluminous, intelligent monitoring systems are expected to play a central role in supporting strategic environmental planning and long-term ecosystem resilience.

4 CONCLUSIONS AND FUTURE WORKS

This study demonstrated that Convolutional Neural Networks can be effectively trained to automate the identification and enumeration of benthic macrofauna from digital microscopy images, achieving high classification accuracy, robust generalization, and inference speeds compatible with real-time laboratory deployment. The trained model attained a mean mAP50 of 0.939 and an F1-score of 0.93 across five taxonomic classes, with per-class accuracy reaching 0.98 for *HeliobiaN* and *HeliobiaM1* and 1.00 for *Cassid_Flum*. These results confirm that the proposed pipeline constitutes a scientifically rigorous and operationally practical alternative to conventional manual triage methods.

From a strategic environmental management perspective, the implications of this work extend well beyond laboratory efficiency. Automating benthic macrofauna analysis enables the continuous integration of sensitive ecological indicators into decision-making processes, expanding the planning, control, and risk-response capabilities of both public agencies and private operators. The system provides a high-throughput decision-support tool for environmental licensing, ecological impact assessment, and biodiversity certification, facilitating a transition from reactive to proactive conservation strategies grounded in real-time empirical evidence.

In the context of global climate change, the capacity to generate continuous, georeferenced, and statistically validated time series of benthic community data represents a strategic advance. Benthic macrofauna respond sensitively to temperature anomalies,

dissolved oxygen depletion, and contaminant accumulation, precisely the stressors intensifying under current climate trajectories. Early-warning signals embedded in these time series can inform adaptive management plans, trigger timely interventions, and support the delineation of priority conservation zones, thereby operationalizing the climate resilience frameworks demanded by national and international environmental policy.

The practical scalability of the approach is a further key contribution. Expanding monitoring frequency and spatial coverage without proportional increases in operational cost removes a longstanding barrier to continuous ecological surveillance. The proposed approach has potential applicability within environmental monitoring programs associated with National Adaptation Plans, Payment for Environmental Services initiatives, and blue carbon projects. Despite the promising results, the present study has some limitations. The image dataset used for training and validation was relatively small and restricted to a limited number of taxonomic groups. Additionally, the images were obtained under controlled laboratory conditions, which may differ from other acquisition environments. Future studies should expand the dataset, incorporate additional species, and evaluate the model under different imaging conditions to further improve its robustness and generalization capability.

Future work should prioritize three complementary directions. First, dataset expansion across additional taxa, sampling seasons, and image acquisition conditions will be essential to improve mAP50–95 performance and consolidate generalization across the morphological diversity encountered in real monitoring programs. Second, integration of the model into end-to-end automated triage platforms; combining image acquisition hardware, detection inference, and ecological database management; will unlock the full operational potential of the system. Third, the development of transfer learning strategies to adapt the trained model to new geographic regions and lagoon systems with minimal additional annotation effort will substantially broaden its applicability and accelerate adoption by monitoring agencies worldwide.

ABSTRACT

Nature-Based Solutions (NBS) have been adopted in urban planning as alternatives to address environmental problems associated with urbanisation and climate change, including heat islands, flooding, and the reduction of green areas. This systematic review examined studies on the implementation, performance, and post-occupancy evaluation of different types of urban green infrastructure. The findings indicate that urban parks and street trees tend to present more stable long-term results due to accessibility and lower maintenance requirements. In contrast, green roofs and vertical greenery systems increase opportunities for vegetation in densely urbanised areas but require continuous irrigation, maintenance, and specialised technical support. The review also identified differences between the benefits expected during planning stages and the results observed after implementation. Factors related to public management, community participation, maintenance, and socioeconomic conditions directly influence the permanence and effectiveness of these strategies in urban environments. In addition to environmental benefits, the reviewed studies discuss social and economic impacts associated with public space use, property valorisation, and socio-spatial inequalities.

Keywords: Nature-Based Solutions. Green Infrastructure. Post-Occupancy Evaluation. Urban Planning. Urban Sustainability.

RESUMO

As Soluções Baseadas na Natureza (SBN) têm sido utilizadas no planejamento urbano como alternativas para enfrentar problemas ambientais associados à urbanização e às mudanças climáticas, como ilhas de calor, enchentes e redução das áreas verdes. Esta revisão

sistemática analisou estudos sobre implementação, funcionamento e avaliações pós-ocupação de diferentes infraestruturas verdes urbanas. Os resultados indicam que parques urbanos e arborização viária apresentam maior estabilidade ao longo do tempo devido à acessibilidade e menor necessidade de manutenção. Em contrapartida, telhados verdes e jardins verticais ampliam a inserção da vegetação em áreas densamente urbanizadas, mas exigem irrigação, manutenção contínua e suporte técnico especializado. A pesquisa também identificou diferenças entre os benefícios previstos no planejamento e os resultados observados após a implantação das intervenções. Aspectos relacionados à gestão pública, participação comunitária, manutenção e condições socioeconômicas influenciam diretamente a permanência e a efetividade dessas estratégias nas cidades. Além dos benefícios ambientais, os estudos analisados discutem impactos sociais e econômicos relacionados ao uso dos espaços públicos, valorização imobiliária e desigualdades socioespaciais.

RESUMEN

Las Soluciones Basadas en la Naturaleza (SBN) han sido utilizadas en la planificación urbana como alternativas para enfrentar problemas ambientales asociados con la urbanización y el cambio climático, como islas de calor, inundaciones y reducción de áreas verdes. Esta revisión sistemática analizó estudios sobre implementación, funcionamiento y evaluaciones postocupación de diferentes infraestructuras verdes urbanas. Los resultados indican que los parques urbanos y el arbolado viario presentan mayor estabilidad a lo largo del tiempo debido a la accesibilidad y a la menor necesidad de mantenimiento. Por otro lado, los techos verdes y jardines verticales amplían la inserción de vegetación en áreas densamente urbanizadas, pero requieren riego, mantenimiento continuo y soporte técnico especializado. La investigación también identificó diferencias entre los beneficios previstos en la planificación y los resultados observados después de la implementación de las intervenciones. Aspectos relacionados con la gestión pública, la participación comunitaria, el mantenimiento y las condiciones socioeconómicas influyen directamente en la permanencia y efectividad de estas estrategias en las ciudades. Además de los beneficios ambientales, los estudios analizados discuten impactos sociales y económicos relacionados con el uso de los espacios públicos, la valorización inmobiliaria y las desigualdades socioespaciales.

Palabras clave: Soluciones Basadas en la Naturaleza. Infraestructura Verde. Evaluación Postocupación. Planificación Urbana. Sostenibilidad Urbana.

1 INTRODUCTION

The rapid process of urbanisation and climate change has been overloading environmental systems and urban infrastructure. In response, many cities have been adopting Nature-Based Solutions (NBS), often referred to as “Green Zones”, as part of urban regeneration and resilience strategies (Ahn & Juraev, 2023; Balzan *et al.*, 2022; Ferreira *et al.*, 2020; Fox-Kämper *et al.*, 2023). Green Zones include habitat restoration initiatives, urban vegetation, and a range of green infrastructures: green roofs, urban forests, and wetlands (Berg *et al.*, 2024; Coleman *et al.*, 2023; Metwally & Ibrahim, 2022). These initiatives are commonly associated with improvements in air quality, temperature regulation, water management, and biodiversity, as well as potential benefits for human health (Arnberger *et al.*, 2024; Fouad *et al.*, 2023; Lampinen *et al.*, 2022; Santamouris & Osmond, 2020).

Concurrently, urban expansion and the demands of an increasingly digital and consumerist society continue to reduce natural areas and intensify climatic problems such as heat islands, flooding, and the scarcity of natural resources (Kajosaari *et al.*, 2024; Mens *et al.*, 2021; Zhao *et al.*, 2024). In this context, NBS are promoted as effective responses, and their behaviour varies according to the scale of project implementation and maintenance over time.

Beyond environmental aspects, these interventions are also linked to social and economic effects, including changes in the real estate market, in local urban activities, and in the community use of spaces (Lampinen *et al.*, 2023; Morpurgo *et al.*, 2023). However, the results are not always consistent, and improvements do not always correspond to the expectations created during the planning of the proposals over time.

This systematic review examines the effects of NBS, focusing on the possible discrepancy between expected and actual effectiveness. By systematising studies that include post-occupancy evidence, the aim is to identify limitations, contextual factors, and socioeconomic implications linked to green interventions.

2 MATERIALS AND METHODS

Adopting the literature review method, this research uses a methodology structured in three distinct phases, with the aim of (1) identifying, (2) evaluating, and (3) synthesising research on the impacts of NBS and green zones in urban areas. Two main themes guide these stages: the implementation process of Nature-Based Solutions and post-occupancy evaluations, seeking to understand factors that may influence the implementation and permanence of these strategies in urban planning.

For the development of the systematic review, software and digital platforms aimed at searching, organising, and analysing scientific literature were used. The bibliographic searches were carried out through the Science Direct, Scopus, and Portal de Periódicos CAPES databases. The Zotero software was used for storing, organising, and managing the bibliographic references selected throughout the research. The SciSpace platform was used as support for reading, interpreting, and systematising the scientific articles analysed. ChatGPT (OpenAI) was used only as an auxiliary tool for preliminary textual organisation and clarity review, without participation in the selection of studies, critical interpretation of the data, or formulation of the scientific results.

Following a previously defined protocol, the review sought to ensure greater transparency and comprehensiveness in its stages. The initial phase included the bibliographic search, the selection of studies based on previously established inclusion and exclusion criteria, the critical evaluation of the relevance of the selected works, and the synthesis of the main information identified in the literature. This approach allowed the gathering of different perspectives related to the environmental, social, and economic effects of NBS in urban contexts.

2.1 LITERATURE SEARCH AND SELECTION

The selection of studies considered works related to the urban context and to Nature-Based Solutions, prioritising peer-reviewed articles, research focused on the implementation of green infrastructure, and studies associated with the environmental, social, and economic effects of these interventions. Research related to public perception, community participation, appropriation of green spaces, and post-occupancy evaluation of NBS was also included. Duplicate publications, studies without a direct relationship to the urban context, and works without access to the full content were disregarded during the screening.

The bibliographic searches were carried out in the Science Direct, Scopus, and Portal de Periódicos CAPES databases, using combinations of keywords related to NBS, social impacts, public acceptance, public satisfaction, and appropriation of green spaces. The survey aimed to gather research focused both on environmental effects and on the experiences and perceptions associated with green infrastructure in urban areas.

After the initial bibliographic survey stage, the identified works underwent a new screening, considering their direct relationship with the research objectives. Priority was given to studies associated with the environmental and social impacts of NBS in urban areas, especially those focused on the implementation, use, and permanence of these strategies over time. At the end of this stage, 75 articles were selected for full reading and in-depth analysis, together with texts considered relevant for the theoretical foundation of the research.

In addition to the searches related to the implementation and effects of NBS, specific searches focused on post-occupancy evaluations were also carried out. For this, combinations of terms related to post-occupancy evaluation and Nature-Based Solutions were used, seeking to identify studies that analysed differences between the benefits expected during planning and the results observed after the implementation of the interventions.

Table 2

The studies related to post-occupancy evaluations also underwent a screening stage, considering mainly research focused on the behaviour of NBS in real conditions of use, including environmental, social, and economic aspects observed after the implementation of the projects. After this process, 22 articles were selected for detailed analysis.

From the integration of these studies, the review sought to understand how factors related to maintenance, management, community participation, and urban context may influence the effectiveness of NBS over time. In addition to the environmental benefits frequently associated with green infrastructure, the analysis also considered aspects linked to public perception, accessibility, property valorisation, and socio-spatial inequalities observed in different urban contexts.

2.2 DATA SYNTHESIS AND ANALYSIS

The extracted data were synthesised and organised through a narrative approach, allowing the interpretation of the main results identified in the reviewed studies. The analyses were structured into thematic axes related to the environmental, social, and economic impacts of NBS in urban contexts. Among the themes analysed are the environmental gains associated with green infrastructure, the social effects related to the perception and use of spaces, the economic effects found in different urban contexts, and the practical challenges linked to the implementation, maintenance, and management of the interventions.

2.3 DATA EXTRACTION AND SYNTHESIS

The extracted data use qualitative and quantitative methods for NBS projects, with the aim of identifying trends, gaps, and main observations. The analysis focuses on:

- Research focus:** The main objectives of each study will be identified, categorising them as simulation and performance, implementation, or theoretical frameworks. This assists in the discovery of trends and gaps in the literature on NBS.
- Scale of impact:** Each study will be analysed according to the scale of impact of NBS (local, municipal, or regional). This categorisation will help to understand the reach and relevance of the interventions for urban contexts.

- c) Community participation: The level of community involvement in the implementation of NBS implementation projects will be observed and recorded, highlighting, where applicable, reports of active participation of residents or interested groups. This criterion is fundamental for evaluating public acceptance and the potential for appropriation of the interventions.
- d) Satisfaction evaluation: The methods used to measure satisfaction will be indicated, including the use of Likert scales, social well-being indicators, and specific criteria for public acceptance. These data will indicate how the interventions influence the perceptions and well-being experience of residents.

Post-occupancy evaluation aims to provide information about the factors that influence the successful implementation of NBS in urban planning and development. This research will focus on three main aspects:

- a) Perception vs. Post-Occupancy Evaluation: Identifying how expectations compare to actual impacts.
- b) Traditional Solutions vs. Innovative Nature-Based Solutions (NBS): Evaluating urban parks and street trees versus Green Roofs and Vertical Gardens.
- c) Economic and social impact: Evaluating how NBS influence property values, local commerce, and community engagement.

3 ANALYSES AND RESULTS

3.1 EVOLUTION OF RESEARCH ON NBS

Despite the growth of research on NBS in recent years, most studies focus on the environmental impacts of these interventions, while issues related to user perception and experience still appear in a more limited way. Although there is a variety of research focused on the environmental, social, and economic effects of NBS, few works analyse how these spaces are used and incorporated into urban daily life after their implementation (Arnberger *et al.*, 2024; Collier *et al.*, 2023; Frantzeskaki *et al.*, 2019; Mahmoud *et al.*, 2024).

The oldest article identified in this review dates from 2015, a period subsequent to the launch of the Horizon 2020 programme, a European initiative aimed at encouraging research related to NBS and urban sustainability (Horizon Europe, 2023). From 2021 onwards, a more significant increase in the number of publications was observed, possibly associated with the observed consequences of the Covid-19 pandemic regarding the intensification of discussions related to climate change and environmental disasters. During this period, themes linked to urban environmental quality, green areas, and open spaces began to receive

greater attention in different urban contexts (Dawson *et al.*, 2024; Frantzeskaki *et al.*, 2019; Grobman *et al.*, 2023).

Figure 1

Distribution of research areas of interest over time

Source: prepared by the authors, 2026.

In this review, the analysed studies were organised into three main categories: theoretical frameworks, implementation, and simulation/performance.

Between 2015 and 2020, research focused on the theoretical frameworks of NBS predominated, totalling 31 articles. These studies contributed to the conceptual consolidation of green infrastructure in contemporary urban planning, especially in discussions related to sustainability, climate adaptation, and green infrastructure (Frantzeskaki *et al.*, 2019; Kampelmann, 2021; Muñoz-Pizza *et al.*, 2020).

From 2017 onwards, and more evidently after 2020, there was an increase in research related to the practical implementation of NBS in real urban contexts, totalling 22 articles. During this period, case studies, urban applications, and practical evaluations became more frequent, mainly in research related to urban drainage, thermal comfort, environmental quality, and the use of public spaces (Derickson *et al.*, 2024; Dreyer *et al.*, 2018; Grobman *et al.*, 2023; Mahmoud *et al.*, 2024).

The simulation and performance category gathered 15 articles focused on the evaluation of the environmental impacts of NBS through simulation tools and performance metrics. The studies in this category analyse factors associated with climate resilience, urban biodiversity, thermal comfort, and environmental sustainability (Ghazalli *et al.*, 2018; Pitman *et al.*, 2015; Santamouris & Osmond, 2020). Even so, much of this research remains concentrated on technical and environmental indicators, while elements involving user experience and social impacts appear less recurrently (Kampelmann, 2021; Muñoz-Pizza *et al.*, 2020).

3.2 ENVIRONMENTAL IMPACTS OF NBS

In the reviewed studies, NBS appear associated with different environmental gains in urban areas. Among the most recurrent effects are the reduction of heat islands, local thermal regulation, stormwater management, and support for urban biodiversity. Green infrastructure such as urban forests, green roofs, and vertical vegetation systems can contribute to these processes through the increase in vegetation cover, evapotranspiration, and shading, as well as the reduction of impermeable surfaces (Ghazalli *et al.*, 2018; Pitman *et al.*, 2015; Santamouris & Osmond, 2020; Berg *et al.*, 2024; Schneider *et al.*, 2024).

In the case of thermal regulation, the studies indicate that the presence of vegetation can reduce surface temperatures and improve microclimatic conditions in urban areas. This effect occurs more evidently in interventions with greater vegetation mass, such as urban forests and parks, but also appears in solutions applied at the building scale, such as green roofs and vertical gardens. In these situations, improvements tend to be more localised, contributing to immediate environmental comfort and, in some cases, to the reduction of building cooling energy demand (Ghazalli *et al.*, 2018; Santamouris & Osmond, 2020; Pitman *et al.*, 2015).

Water management also appears recurrently in the analysed literature. Permeable surfaces, rain gardens, and infiltration trenches contribute to increasing rainwater infiltration, reducing surface runoff, and decreasing pressure on urban drainage systems (Doll *et al.*, 2023; Fouad *et al.*, 2023; Virtudes, 2016; Tedesco *et al.*, 2019). Some of the studies also associate these strategies with the reduction of flood risks, the improvement of stormwater management, and assistance in aquifer recharge in urbanised areas (Fouad *et al.*, 2023; Doll *et al.*, 2023).

Another environmental benefit identified refers to urban biodiversity. The introduction of vegetation in urbanised areas can expand habitats, favour ecological connectivity, and support the presence of different plant and animal species. These effects are more evident in interventions that use native species or that are articulated with already existing ecological networks, such as green corridors, riparian restoration, and urban reforestation areas (Molari *et al.*, 2024; Rostami *et al.*, 2015; Berg *et al.*, 2024; du Toit *et al.*, 2018).

Figure 2

Distribution of research by nature-based strategies and their relationship with multiple environmental scales. Building Scale: Urban Gardens, Green Roofs and Vertical Gardens. City Scale: Urban Parks, Urban Reforestation. Urban Regional Scale: Riparian Vegetation Restoration, Ecosystem Restoration, Wetland Construction

Source: prepared by the authors, 2026.

The distribution presented in Figure 2 indicates that the analysed strategies operate at different environmental scales. Larger-scale interventions, such as urban reforestation, ecological restoration, and riparian vegetation restoration, tend to relate to broader processes of climate regulation, biodiversity conservation, and water management. Conversely, localised solutions, such as green roofs, vertical gardens, and urban gardens, present localised effects, but can be relevant in densely urbanised areas, where the availability of free land is reduced (Berg *et al.*, 2024; du Toit *et al.*, 2018; Schneider *et al.*, 2024).

The review demonstrates the predominance of isolated NBS implementation strategies. Among the analysed studies, 40 articles addressed single interventions, such as urban forests, green roofs, and rain gardens, representing approximately 59% of the sample. Meanwhile, 18 studies investigated interconnected solutions, combining different elements of green infrastructure, such as permeable pavements, vegetated corridors, and integrated urban drainage systems.

This difference is relevant because isolated interventions generally seek to solve specific and localised problems, while combined solutions allow the integration of multiple environmental functions in urban space. Among these functions are the improvement of drainage, the increase of shading, the expansion of habitats, and the strengthening of ecological connectivity. Thus, the studies indicate that interconnected systems tend to present greater potential for contributing to urban resilience and to the environmental performance of cities (C. Wang *et al.*, 2016; Tedesco *et al.*, 2019; Berg *et al.*, 2024; Schneider *et al.*, 2024).

3.3 SOCIAL AND ECONOMIC IMPACTS AND POST-OCCUPANCY EVALUATIONS OF NBS

When analysing the impacts of NBS in urban contexts, it is observed that their effects vary according to the type of intervention, the implementation conditions, and the social, economic, and spatial characteristics of each locality. In the reviewed studies, aspects related to community participation, user perception, property valorisation, maintenance, and post-occupancy evaluation appear recurrently, indicating that the effects of these interventions go beyond exclusively environmental issues.

Part of the analysed research relates the implementation of urban green areas to the increase in community use of public spaces and the expansion of opportunities for social interaction. Urban parks, street trees, community gardens, and other interventions associated with green infrastructure frequently appear linked to people's permanence in urban spaces, leisure activities, and the perceived improvement in environmental quality (Megyesi *et al.*, 2024; Monteiro *et al.*, 2020; Rostami *et al.*, 2015; Semeraro *et al.*, 2024). In different contexts, these studies also associate such spaces with the improvement of the population's physical and mental well-being, especially in areas with lower availability of urban vegetation (Arnberger *et al.*, 2024; Dawson *et al.*, 2024).

Figure 3 presents a synthesis of the approaches identified in the reviewed studies, bringing together social, economic, and methodological aspects related to the evaluation of NBS in urban contexts. The graphic representation organises the results into four main axes: stakeholder involvement, user satisfaction metrics, economic impacts, and types of post-occupancy evaluation. These data are taken up and discussed in detail in the following paragraphs, based on the individual analysis of each axis presented in the figure.

Figure 3

Synthesis of the approaches analysed in the studies on urban green infrastructure, including stakeholder involvement, satisfaction metrics, economic impacts, and post-occupancy evaluation methods

Source: prepared by the authors, 2026.

Based on the synthesis presented in Figure 3, it is observed that the social, economic, and post-occupancy effects of NBS do not occur homogeneously. Some studies point out that certain strategies may contribute to processes of property valorisation and socio-spatial transformation, especially in regions subjected to recent urban requalification. In these situations, the increase in property value and in the cost of remaining in certain areas may affect more vulnerable populations, broadening discussions related to urban equity and the unequal distribution of the benefits produced by green infrastructure (Adegun *et al.*, 2022; Frantzeskaki *et al.*, 2019; Ring *et al.*, 2021; Tedesco *et al.*, 2019; Buijs *et al.*, 2024; Peroni; Pappalardo, 2024).

The implementation of NBS also appears directly related to the social, spatial, and cultural characteristics of each urban context. The reviewed studies indicate that interventions developed with greater attention to local dynamics tend to present greater public acceptance and better integration into the daily life of the population (Arnberger *et al.*, 2024; Berg *et al.*, 2024; Dawson *et al.*, 2024; Derickson *et al.*, 2024). In part of the analysed research, community participation contributed to identifying demands related to the use of spaces, accessibility, people's permanence, and the maintenance of green areas (Barron & Rugel, 2023; Fonteyn *et al.*, 2024).

Figure 3, Diagram 1, presents the results related to stakeholder involvement in green infrastructure projects. The forms of participation identified in the studies include direct community involvement, integration between different social actors, public workshops, and co-creation processes. Among the analysed works, 44% reported some level of community participation during the planning, implementation, or maintenance stages of the green infrastructure, while 56% did not address this aspect explicitly. The studies also indicate that more continuous participatory processes tend to be associated with higher levels of acceptance, appropriation, and use of the green spaces implemented by the local population (Arnberger *et al.*, 2024; Collier *et al.*, 2023; Fonteyn *et al.*, 2024; Fox-Kämper *et al.*, 2023).

However, the studies also point out limitations related to the continuity of participatory processes. In some contexts, difficulties associated with public management, reduced financial resources, and institutional barriers hindered the continuous involvement of the community after the initial implementation of green strategies (du Toit *et al.*, 2018; Barron & Rugel, 2023; Derickson *et al.*, 2024). Derickson *et al.* (2024), when discussing urban justice and green infrastructure in different international contexts, also point out that many urban greening projects present community participation limited to the initial stages of public consultation, without permanent mechanisms of shared governance after the implementation of the interventions. According to the authors, this frequently results in poorly representative processes and in the difficulty of maintaining the strategies in socially vulnerable areas.

Barron and Rugel (2023), when analysing green spaces aimed at the mental health of young adults, observed that the effectiveness of these interventions depended directly on the continuity of local management, maintenance of the spaces, and permanence of community actions after the initial implementation, indicating that the absence of continuous institutional support may compromise the use and social appropriation of these areas over time. In addition, part of the research highlights that socially vulnerable groups are not always able to participate equivalently in urban planning processes, mainly in contexts marked by socioeconomic inequalities and limited access to public participation mechanisms (Adegun *et al.*, 2022; Ring *et al.*, 2021).

Adegun *et al.* (2022) analysed and discussed vertical vegetation systems in low-income urban contexts in sub-Saharan African countries, and identified that the costs of installation, maintenance, and irrigation frequently hindered the implementation of these solutions in socially vulnerable communities. The authors also highlight that, in many cases, local urban priorities were associated with access to basic infrastructure, housing, and sanitation, reducing the viability of technically more complex green strategies in certain urban contexts.

Ring *et al.* (2021), when analysing the Green and Open Space Factor instrument in Vienna, observed that, although green infrastructure policies may contribute to expanding urban vegetated areas, the distribution of these benefits tends to occur unevenly between different regions of the city. The authors point out that areas subjected to greater urban investments frequently concentrate more qualified green interventions, while peripheral or socially vulnerable neighbourhoods may present less access to the environmental improvements associated with green infrastructure.

Ali *et al.* (2020), when investigating green regeneration processes in Leipzig, Germany, also identified relationships between the implementation of green areas and processes of property valorisation. The study shows that urban environmental interventions can simultaneously contribute to environmental improvements and socio-spatial transformations, especially in neighbourhoods subjected to recent urban requalification processes, broadening debates related to green gentrification and the permanence of the populations.

In addition to community participation, much of the analysed research also sought to understand how users perceive and use these solutions in daily life after their implementation. For this, the analysed studies used different methods of evaluating satisfaction and environmental perception.

Figure 3, Diagram 2, presents the metrics used to evaluate satisfaction in studies related to urban green infrastructure. Among the analysed works, 35% used Likert-type scales to evaluate aspects associated with environmental quality, accessibility, and perception of well-being in green spaces (Arnberger *et al.*, 2024; Rostami *et al.*, 2015; Semeraro *et al.*, 2024).

Arnberger *et al.* (2024), for example, applied structured questionnaires with scales aimed at analysing the perceived psychological benefits in different types of urban green areas by adolescents, university students, and adults. Among the aspects evaluated were the sensation of relaxation, stress reduction, sociability, perception of safety, and contact with nature. The results demonstrate that perception scales have been widely used to understand the relationship between users and urban green spaces, allowing the identification of different dimensions of the environmental experience and the well-being associated with these areas.

Direct questions about satisfaction appeared in 25% of the research, generally related to maintenance, comfort, and the recreational value of the interventions (Monteiro *et al.*, 2020; Schneider *et al.*, 2024). Schneider *et al.* (2024), for example, investigated the population's willingness to contribute to urban greening programmes, identifying relationships between environmental satisfaction, aesthetic perception, and public support for green interventions.

Other studies used open responses and qualitative feedback to understand experiences associated with the everyday use of green spaces (Dawson *et al.*, 2024; Megyesi *et al.*, 2024). Dawson *et al.* (2024), when investigating the preferences of immigrants in urban green areas in Sweden, identified that factors such as the sensation of safety, possibilities for social interaction, and cultural familiarity directly influenced the appropriation of these spaces.

Although much research is focused on temperature, urban drainage, or biodiversity, the continuous use and permanence of these infrastructures also depend on how the spaces are perceived and appropriated by the population (Collier *et al.*, 2023; Frantzeskaki *et al.*, 2019; Mahmoud *et al.*, 2024). Collier *et al.* (2023), for example, highlight that processes of planning, management, and shared maintenance directly influence the continuity of use of green infrastructure in urban contexts.

The reviewed studies also identified economic impacts associated with the implementation of green infrastructure in urban areas. Ali *et al.* (2020), when investigating green regeneration processes in Leipzig, Germany, identified relationships between the implementation of urban green areas and property valorisation in neighbourhoods subjected to urban requalification. Similarly, Lampinen *et al.* (2023) point out that policies related to green infrastructure are frequently associated with the environmental and economic valorisation of certain urban areas, although the observed benefits vary according to the socio-spatial context and the type of intervention implemented.

Figure 3, Diagram 3, presents the main economic impacts associated with green infrastructure in the analysed studies. Part of the research relates the presence of these interventions to property valorisation, the reduction of energy costs, and the economic dynamisation of certain urban areas (Buijs *et al.*, 2024; Peroni & Pappalardo, 2024; Lampinen *et al.*, 2023; Moffat *et al.*, 2024).

In addition, some studies point out that elements such as green roofs, vegetated areas, and sustainable urban drainage systems may contribute to reducing the energy demand for building cooling, as well as decreasing costs associated with stormwater management (C. Wang *et al.*, 2016; Tedesco *et al.*, 2019). Thus, the results indicate that green infrastructure may produce both direct and indirect economic effects, related not only to the valorisation of urban space, but also to the reduction of operational expenses and the improvement of the environmental conditions of cities.

However, the observed economic trends vary according to the type of intervention and the urban context analysed. Although part of the research associates NBS with the environmental valorisation of cities, some studies indicate that the effects may occur

unevenly, especially in areas subjected to processes of accelerated property valorisation (Frantzeskaki *et al.*, 2019; Ring *et al.*, 2021).

Post-occupancy evaluations also appear recurrently in the reviewed studies, mainly to understand how green interventions behave after their implementation in real conditions of use. As presented in Figure 3, Diagram 4, economic analyses were the most frequent approaches among the reviewed studies, corresponding to 64% of the identified methodologies. Sensor monitoring was present in 50% of the analysed research, being used mainly for the evaluation of temperature, air quality, energy efficiency, and urban biodiversity (Dreyer *et al.*, 2018; Mahmoud *et al.*, 2024; Natanian *et al.*, 2024; Widera, 2021).

In addition, perception surveys and focus groups also appeared among the methods employed to understand user satisfaction and the environmental perception related to urban green spaces (Ali *et al.*, 2020; Anderson & Gough, 2020). The results demonstrate that post-occupancy evaluation studies in green infrastructure combine quantitative and qualitative approaches, seeking to analyse both the environmental performance of the interventions and the experience and perception of users in relation to the implemented spaces.

The studies that address post-occupancy evaluations show important differences between traditional green interventions and more recent solutions. Urban parks and tree-lined streets tend to present more consistent community use over time, mainly due to accessibility and lower maintenance demands (Dreyer *et al.*, 2018; Natanian *et al.*, 2024; Rostami *et al.*, 2015; Santamouris & Osmond, 2020). On the other hand, green roofs and vertical gardens present more variable results, especially in contexts where there are limitations related to continuous maintenance, operational costs, and accessibility of the systems (Ghazalli *et al.*, 2019; Liu *et al.*, 2024; Wilby, 2007; Zhong *et al.*, 2024).

4 DISCUSSIONS

In summary, the analysed studies indicate a progressive growth of research on NBS in the urban context, moving from more conceptual approaches to practical applications, performance analyses, and post-occupancy evaluations. Even so, themes related to user perception, community participation, and everyday experiences associated with green spaces tend to receive less in-depth treatment when compared to environmental and technical analyses (Collier *et al.*, 2023; Fonteyn *et al.*, 2024; Mahmoud *et al.*, 2024).

Throughout the reviewed research, an expansion of interest in NBS was observed in discussions on urban planning, especially in view of the worsening of climate change, the sealing of cities, and the reduction of vegetated areas. However, the results found suggest that the effects of these interventions vary according to the context in which they are

implemented and should not be understood as universal responses to contemporary urban problems. The reviewed literature points out that interconnected strategies may expand benefits related to stormwater management, ecological connectivity, and support for urban biodiversity. Nevertheless, the results tend to depend on local conditions, design choices, the scale of implementation, and the continuity of maintenance over time (Adegun *et al.*, 2022; Tedesco *et al.*, 2019; Schneider *et al.*, 2024).

The analysed works also suggest that environmental benefits usually present greater stability when associated with interventions already incorporated into urban daily life, such as parks, street trees, and public green areas. These strategies frequently appear related to the improvement of thermal comfort, the expansion of permanence in public spaces, and the increase in opportunities for urban interaction. Even so, the distribution of these infrastructures occurs unevenly between different cities and regions. In many developing countries, including Brazil, there are still limitations related to the availability of public green areas, urban planning, and resources allocated to the implementation and maintenance of these strategies.

In addition, part of the research indicates that the acceptance of these interventions may be more linked to accessibility, ease of use, and integration into the urban routine than to the technical recognition of the NBS concept. In many cases, the population enjoys the benefits associated with vegetated areas without necessarily associating them with NBS. In contexts marked by reduced access to parks, squares, and qualified green infrastructure, post-occupancy evaluations themselves may present limitations, since part of the population has restricted contact with these spaces.

On the other hand, more recent solutions, such as green roofs and vertical vegetated systems, tend to present more variable behaviour. Although frequently associated with environmental innovation and climate adaptation, these interventions may require continuous maintenance, irrigation, specialised technical support, and prolonged financial resources. Ghazalli *et al.* (2019) highlight that the performance of these systems may depend directly on maintenance, the appropriate choice of plant species, and climate compatibility. In the Brazilian context, these solutions still appear in a relatively isolated way, often linked to isolated initiatives, institutional buildings, or higher economic standard developments, partly due to the costs involved and the low integration of these strategies into local urban policies. Even so, in densely urbanised areas, these systems may expand the possibilities of inserting vegetation in places with little availability of free land.

Another recurrent aspect refers to the difference between the benefits expected during planning and the effects observed after the implementation of green infrastructure. Part of

the studies suggests that expectations related to microclimatic improvement, environmental quality, and the social use of spaces may be broader in the initial phases of the projects than those verified later in real situations of use. This difference tends to become more evident in technically more complex vegetated systems, in which maintenance, vegetation replacement, irrigation, and operational costs come to directly influence the functioning of the interventions over time.

The analysed research also shows that the effects of NBS may be associated not only with the environmental performance of the interventions, but also with social, institutional, and economic factors. Issues related to community participation, public management, institutional capacity, and socioeconomic context tend to directly influence the permanence and use of these urban structures. In different studies, projects developed with greater local participation presented greater adequacy to the needs of residents and less resistance during implementation. Even so, participatory processes did not always occur in a continuous or representative way, mainly in contexts marked by social inequalities and limited access to public participation mechanisms.

The discussions on economic impacts also reveal contradictory situations. Although part of the literature associates green infrastructure with property valorisation, improvement of urban environmental quality, and reduction of energy costs, the observed effects vary according to the type of intervention and the context analysed. Ali *et al.* (2020), when investigating green regeneration processes in Leipzig, Germany, identified relationships between the implementation of green areas and property valorisation in neighbourhoods subjected to urban requalification. In these cases, environmental valorisation may occur simultaneously with the increase in the cost of permanence of local populations, broadening discussions related to green gentrification and the unequal distribution of environmental benefits.

The review also points out a recurrent imbalance in research on NBS. A large part of the studies focuses on technical and environmental indicators, such as temperature, urban drainage, biodiversity, and energy efficiency, while aspects related to the everyday experience of users, appropriation of spaces, and long-term social impacts remain less explored. This suggests that part of the evaluations on green infrastructure still considers environmental performance in a relatively isolated way, without fully incorporating the social and urban relationships that influence its permanence and use over time.

In general, the reviewed studies indicate that the effects of NBS may go beyond strictly environmental issues. The continuity of these strategies tends to depend on the social, economic, and institutional conditions present in each urban context. Thus, post-occupancy

evaluations become relevant because they reveal differences between the benefits expected during planning and what effectively occurs after implementation. In this sense, the combination of quantitative and qualitative methods may contribute to broader analyses, incorporating not only environmental indicators, but also issues related to everyday use, maintenance, and user perception.

5 CONCLUSIONS

The review carried out indicates that NBS have been assuming an increasingly present role in discussions on urban planning, climate change, and the environmental qualification of cities. However, the analysed studies also show that the effects of these strategies tend to vary according to the social, economic, climatic, and institutional context in which they are implemented. In countries such as Brazil, this discussion may still be considered controversial, mainly due to urban inequalities, infrastructure limitations, maintenance difficulties, and low continuity of public policies related to urban green areas.

Although there are already relevant examples of the implementation of urban parks, street trees, green roofs, and vegetated systems in different Brazilian cities, part of these initiatives still occurs in an isolated and unequal way. In many cases, the difficulties related to financing, continuous maintenance, and the integration of these strategies into urban planning may limit the permanence and performance of these interventions over time. In this sense, the review suggests that the advancement of NBS in the urban context may depend not only on the expansion of technical and environmental research, but also on the strengthening of more effective mechanisms of implementation, management, and post-occupancy monitoring.

The reviewed studies also indicate that aspects related to community participation, public perception, and everyday use of green infrastructure still appear in a less in-depth way in the literature when compared to environmental and technical indicators. In addition, in contexts marked by socio-spatial inequalities, part of the population may have limited access to the urban green areas themselves, hindering processes of participation, appropriation, and evaluation of these interventions.

Thus, the review points out the need for more complex and integrated urban diagnoses, capable of simultaneously considering environmental, social, economic, and institutional factors associated with NBS. The importance of expanding studies focused on post-occupancy evaluations, user perception, continuity of maintenance, and the effects of these strategies over time in different urban realities is also observed. In this sense, future research may contribute to a more in-depth understanding of the limitations, potentialities,

and contradictions associated with the implementation of NBS in cities marked by distinct urban contexts and socio-environmental inequalities.

ABSTRACT

Introduction: The exposome, a concept introduced by Wild in 2005, encompasses the totality of exogenous and internal factors that a person experiences throughout their life and that influence their health or disease. **Objective:** To analyse what the exposome is and its importance in public health. **Methods:** A systematic documentary review was conducted using the PRISMA methodology in academic sources and artificial intelligence tools. It identifies its classification into general external, specific external, and internal domains; and describes measurement methods using biomarkers. **Results:** The importance of integrating multidisciplinary approaches and emerging technologies such as artificial intelligence for the identification, characterisation, and quantification of exposures is highlighted, in order to design more personalised preventive, diagnostic, and therapeutic strategies. **Conclusion:** The importance of early detection at different stages of life is recognised, taking into account the technical and methodological challenges of measuring complex exposures. Therefore, it is necessary to generate and develop open databases that strengthen public health.

Keywords: Exposome. Biomarkers. Public Health. Artificial Intelligence.

RESUMO

Introdução: O exposoma, conceito introduzido por Wild em 2005, abrange a totalidade dos factores exógenos e internos que uma pessoa experimenta ao longo da sua vida e que influenciam o seu estado de saúde ou doença. **Objectivo:** Analisar o que é o exposoma e a sua importância na saúde pública. **Métodos:** Realizou-se uma revisão sistemática do tipo documental, utilizando a metodologia PRISMA, em fontes académicas e ferramentas de inteligência artificial, identificando a sua classificação em domínios externo geral, externo específico e interno; descreve métodos de medição mediante biomarcadores. **Resultados:** Destaca-se a relevância de integrar abordagens multidisciplinares e tecnologias emergentes como a inteligência artificial para a identificação, caracterização e quantificação de

exposições, com o fim de desenhar estratégias preventivas, diagnósticas e terapêuticas mais personalizadas. Conclusão: Reconhecer a importância da detecção precoce nas diferentes etapas da vida, tendo em conta os desafios técnicos e metodológicos para medir exposições complexas; pelo que é necessário ir gerando e desenvolvendo bases de dados abertas que fortaleçam a saúde pública.

Palavras-chave: Exposoma. Biomarcadores. Saúde Pública. Inteligência Artificial.

RESUMEN

Introducción: El exposoma, concepto introducido por Wild en 2005, abarca la totalidad de factores exógenos e internos que una persona experimenta a lo largo de su vida y que influyen en su estado de salud o enfermedad. Objetivo: Analizar qué es el exposoma y su importancia en la salud pública. Métodos: Se realizó una revisión sistemática de tipo documental, utilizando la metodología PRISMA, en fuentes académicas y herramientas de inteligencia artificial, identificando su clasificación en dominios externo general, externo específico e interno; describe métodos de medición mediante biomarcadores. Resultados: Se destaca la relevancia de integrar enfoques multidisciplinarios y tecnologías emergentes como la inteligencia artificial para la identificación, caracterización y cuantificación de exposiciones, con el fin de diseñar estrategias preventivas, diagnósticas y terapéuticas más personalizadas. Conclusión: Reconocer la importancia de la detección temprana en las diferentes etapas de la vida, tomando en cuenta los desafíos técnicos y metodológicos para medir exposiciones complejas; por lo que es necesario ir generando y desarrollando bases de datos abiertas que fortalezcan la salud pública.

Palabras clave: Exposoma. Biomarcadores. Salud Pública. Inteligencia Artificial.

1 INTRODUCTION

The exposome is a term coined by the epidemiologist Wild in 2005, which means the total addition of all exogenous and endogenous risk factors that a person perceives from birth to death, such as exposures to chemical and environmental substances, radiation, climate, environmental noise, stress, among others. As regards endogenous factors, these include lifestyle and health-related behaviours.

Studying the exposome of people is complex owing to its variability and the number of factors that interact throughout their life. Nevertheless, it is necessary to carry out an analysis in order to understand how risk factors contribute to health and/or disease. According to this analysis, it is possible to develop and design more personalised prevention and treatment strategies and therefore more effective ones for the individual.

It is worth mentioning that the exposome is dynamic, encompasses factors of diverse nature, and these may vary throughout life; an example of this may be one's socioeconomic status or level, physical and/or chemical agents, lifestyle habits, or the environment where the individual developed or lives.

The exposome can be classified according to three domains: general external, specific external, and internal.

The general external domain comprises social and psychological aspects such as social class, education; the psychological and mental state and the environment where the individual lives and/or carries out their daily activities.

The specific external domain contemplates radiation, environmental and chemical pollution, infectious-type microorganisms, diet, lifestyle (consumption of legal or illegal substances), occupation, among others.

The internal domain includes factors and processes such as: hormone levels, metabolism, body morphology (endomorph, mesomorph, ectomorph), physical activity, gut microbiota, epigenetics, etc.

In view of the above, it is necessary to analyse what the exposome is and its importance in public health.

2 METHOD

2.1 DESIGN AND PROTOCOL

The present research was developed through a systematic documentary review. To ensure the transparency, comprehensiveness, and reproducibility of the process, the guidelines of the PRISMA statement (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) were strictly followed. The study was oriented towards conceptualising the

exposome, identifying its domains, measurement methods, and current challenges in the field of health and education.

2.2 ELIGIBILITY CRITERIA (PICOS FRAMEWORK)

The selection of studies was based on the following eligibility criteria, structured under the acronym PICO:

- a) Population/Context: Individuals at any stage of the life course (from the prenatal stage to old age) in public health settings.
- b) Intervention/Phenomenon of interest: The concept of the exposome as the totality of non-genetic exposures (exogenous and endogenous factors).
- c) Comparator: Not applicable for this documentary review, although variations according to individual susceptibility and critical windows were analysed.
- d) Outcomes: Conceptual definitions, classification into domains, exposure/effect biomarkers, and the impact on the global burden of disease.
- e) Study designs: Observational studies, systematic reviews, reports from accredited health organisations, and original research articles.
- f) Additional inclusion criteria: Full-text articles, open access, published between 2020 and 2025, in Spanish and English, that included the keywords in the title.
- g) Exclusion criteria: Documents with restricted access, only abstracts, or those whose titles bore no direct relation to the object of study.

2.3 SOURCES OF INFORMATION AND SEARCH STRATEGY

A hybrid and exhaustive search strategy was employed, carried out between the years 2020 and 2025.

2.3.1 Traditional databases

High-impact databases were consulted: PubMed, Embase, Medline, SciELO, Cochrane Library, and Google Scholar. Controlled descriptors (DeCS and MeSH) and Boolean operators were used: exposome AND health AND disease.

2.3.2 Integration of Generative Artificial Intelligence (GAI)

To enhance the capacity for the discovery of grey literature and technical documents, GAI tools were integrated in the following manner:

Tools used: Large language models (LLMs) such as ChatGPT-4 and Perplexity Free were employed, together with platforms specialised in academic research such as TextCortex.com, Elicit.com, and semanticscholar.org.

Purpose: AI was used for the initial identification of sources, the synthesis of complex concepts, and the location of reports from international organisations (WHO, GBD) that often fall outside traditional bibliographic indexes.

Procedure (Prompting): A structured prompt designed to minimise hallucinations and maximise academic accuracy was applied: "Find academic documents (articles, reports, cases) on the exposome and its implication in health-disease in databases such as Cochrane, PubMed and Medline. Detail classification, measurement, importance and challenges".

2.4 STUDY SELECTION PROCESS

The selection flow was divided into four consecutive phases to minimise selection bias:

- a) Identification: Compilation of 9,650 total records from databases and AI.
- b) Screening: Removal of duplicates and review of titles/abstracts, resulting in 3,685 records.
- c) Eligibility assessment: Analysis of 160 full texts to verify compliance with the PICO criteria.
- d) Final selection: Inclusion of 48 articles that constituted the definitive corpus.

This process was carried out independently by the reviewers, resolving discrepancies through academic consensus.

2.5 DATA EXTRACTION AND SYNTHESIS

For the collection of information, a standardised extraction form was used that allowed the following elements to be tabulated: author/year, city or project, methodologies employed, exposures assessed, and main findings (predictive performance such as R²).

Data synthesis was carried out through thematic and comparative analysis. Owing to the heterogeneity of the studies (which range from biomonitoring to AI modelling), a quantitative meta-analysis was not performed, opting for a narrative synthesis that groups the findings into dimensions: conceptual, technical (biomarkers), technological (AI and GIS), and public policy.

2.6 QUALITY ASSESSMENT AND RISK OF BIAS

The validity of the conclusions was strengthened through the systematic refinement of the evidence, ensuring that the selected studies met the methodological requirements of the systematic approach proposed by PRISMA. Studies with robust methodological frameworks

(such as the HELIX and LEnS projects) were prioritised to ensure that the final synthesis reflects the state of the art with the least possible bias.

2.7 APPLICATION OF THE PRISMA METHODOLOGY

With the purpose of ensuring the transparency and reproducibility of the review process, the present study followed the guidelines established by the PRISMA methodology (Preferred Reporting Items for Systematic Reviews and Meta-Analyses). The procedure was developed sequentially in four interrelated stages:

- a) Identification: Potentially relevant studies were compiled from the databases and generative artificial intelligence tools previously described, ensuring broad coverage of the sources.
- b) Screening: In this phase, duplicate records were removed and an initial review of titles and abstracts was carried out to discard works that bore no direct relation to the objectives of the research.
- c) Eligibility assessment: The full texts of the preselected studies were examined in detail, strictly applying the previously defined inclusion and exclusion criteria.
- d) Final selection: Only those documents that met all the methodological and thematic requirements were integrated, constituting the definitive corpus for the analysis and synthesis of the information.

This approach made it possible to systematically refine the available evidence, reducing selection bias and strengthening the validity of the conclusions derived from the study.

2.8 RESULTS OF THE SELECTION PROCESS

As a result of the initial search, 9,650 articles were identified and, after the rigorous application of the inclusion and exclusion criteria, the final sample comprised 48 articles.

The PRISMA flow diagram illustrating this process is presented below:

Figure 1*PRISMA 2020 flow diagram. Review of articles on the exposome*

Source: prepared by the authors.

3 RESULTS

3.1 EXPOSOME: CONCEPT, RELEVANCE, AND SCIENTIFIC FOUNDATION

The exposome integrates all the non-genetic exposures to which an individual is subjected from prenatal life to old age. This approach arises from the need to understand the burden of disease attributable to environmental, social, and biological factors. The WHO estimates that 24% of human diseases are attributable to non-genetic exposures, which evidences a wide margin for prevention. Likewise, the Global Burden of Disease identified that nine million annual deaths are related to air, water, and soil pollution, marking the urgency of mapping the human exposome.

The impact of these exposures depends on the dose, duration, timing of the exposure, and individual susceptibility. The physiological, endocrine, hormonal, and metabolic variations throughout life determine critical windows, especially during gestation (13) and childhood, where exposures can alter the developmental process with lifelong repercussions. (8,9)

3.2 MEASUREMENT OF THE EXPOSOME AND USE OF BIOMARKERS

The measurement of the exposome arises from the challenge of documenting internal and external exposures in a comprehensive manner. To this end, human and environmental biomonitoring strategies are employed, (14) which include analysis of blood, urine, (12) hair, teeth, nails, (15) placenta (16) and meconium. (16) These biospecimens make it possible to reconstruct short- and long-term exposures, taking into account specific chemical half-lives (for example, 15 h for chlorpyrifos in blood). (12)

Biomarkers are classified into:

- a) Exposure: which measures exogenous substances or their metabolites.
- b) Effect: which reflects the physiological or biochemical alterations associated with disease.
- c) Susceptibility: which determines the differential response to exposure.

And the omics sciences (genomics, proteomics, metabolomics) provide fundamental tools to discover new biomarkers and to characterise or identify the mechanism(s) of toxicity, although these face the challenge of capturing the heterogeneity, the inter-individual variability of the biological response. (24)

3.3 INTERNATIONAL PROJECTS TO STUDY THE EXPOSOME

The HELIX project (Human Early-Life Exposome) represents one of the most robust large-scale efforts to measure prenatal and postnatal exposures in European cohort studies. There, persistent and non-persistent organic compounds are assessed, such as: metals, pesticides, air quality, noise, UV radiation, and access to green spaces, integrated as indicators of childhood growth and health.

The Lifestage Exposome Snapshots (LEnS) (10) arises as a framework project that analyses exposures in target organs and by critical periods, making it possible to advance towards a more precise cartography of the human exposome.

3.4 CONTRIBUTIONS OF ARTIFICIAL INTELLIGENCE (AI) TO THE ANALYSIS OF THE EXPOSOME

AI constitutes a key advance for integrating multiple sources of environmental, biological, and geospatial data. Among the findings described:

- a) Neural networks and clustering algorithms (ANN, K-means, Fuzzy C-means) have managed to obtain predictions of atmospheric pollutants with good performance $R^2=0.7$. (18)
- b) Supervised models (SVM, KNN, Random Forest) have classified housing conditions as proxies of environmental exposure, which are indirect indicators used to estimate or reconstruct, with accuracies of 82–86% (19), past or present environmental exposures, and are especially of great support when direct measurements are not available.
- c) The integration of Geographic Information Systems (GIS), meteorological data, traffic, and surveys makes it possible to map critical points of urban exposure. (21) Likewise, it makes it possible to connect with other applications and data sources (such as HR, BIM, sensors) to combine spatial and non-spatial information, allowing deeper analyses.

These methods, applied in cities such as Buenos Aires, Salamanca, Jayllihuaya, and Bucharest, evidence the potential of AI to analyse complex exposures in real time and to support focused public policies. (20)

3.5 CHALLENGES IN THE ASSESSMENT OF THE EXPOSOME

The main limitations of the assessment of the exposome are:

- a) Difficulty in detecting substances with short half-lives.
- b) Lack of standardised and open databases of biospecimens that allow the development of better diagnoses and treatments, studying diseases, and training human resources.
- c) Major limitations in the qualitative and quantitative analysis of complex samples in the identification of thousands of substances detected by mass spectrometry.
- d) Complexity in carrying out multiple risk assessments that integrate environmental, biological, and social domains. (22, 23)

Nevertheless, advances in metabolomics and bioinformatics and AI promise to improve the precision of the characterisation of the exposome in the coming years.

Table 1

Relevant data from the included studies

City / Project	Methods or Technologies	Exposure assessed	Main findings / performance	Relevance for the exposome
Buenos Aires	Neural networks, clustering	Atmospheric pollutants (SO ₂ , PM10)	R ² =0.718 in pollutant forecasting	Improves prediction of urban exposures
Salamanca	Supervised algorithms (SVM, KNN, RF)	Housing conditions as an environmental proxy	Accuracy between 82–86.3%	Identifies dwellings with environmental risk
Jayllihuaya	GIS + data fusion	Multiple environmental risks	Identification of critical points	Allows interventions to be targeted
Bucharest	AI methods integrated with urban data	Environmental pollution and exposure conditions	Detection of vulnerable areas	Improves risk assessment in urban settings
HELIX (Europe)	Biomonitoring + sensors + omics	Prenatal and postnatal exposures (metals, pesticides, noise, air, UV, green spaces)	Associations with childhood growth and health	Establishes an early comprehensive framework of the exposome
LEnS	Target-organ models	Susceptibility windows	Mapping of the exposome by organ systems	More granular and transdisciplinary approach

Source: prepared by the authors.

The reviewed evidence demonstrates that the exposome constitutes an essential construct for understanding the global burden of disease attributable to non-genetic

exposures. The literature indicates that a significant proportion of human diseases ($\approx 24\%$) are preventable through the identification and mitigation of environmental, social, and biological factors, which supports the epidemiological value of the exposome throughout the life course.

The included studies show significant progress in the capacity to measure, integrate, and analyse multiple exposures through biomarkers, alternative biospecimens, and high-resolution analytical technologies. The omics sciences emerge as critical tools to characterise mechanistic pathways and to discover new exposure indicators, although the challenge of capturing individual variability in biological responses persists.

Artificial intelligence positions itself as a cross-cutting axis that enhances the assessment of the exposome through predictive algorithms, classification, spatial analysis, and fusion of heterogeneous data. The studies carried out in cities of Latin America and Europe evidence that AI improves the prediction of pollutants, identifies areas of urban risk, and makes it possible to develop more robust models of environmental exposure.

The HELIX and LEnS projects represent methodological references in the integration of biomonitoring, environmental sensors, and susceptibility-window approaches. These models make it possible to establish relationships between early exposures and childhood health outcomes, which reinforces the importance of intervening at critical stages of development.

The literature converges in indicating that the assessment of the exposome requires multidisciplinary approaches that integrate toxicology, epidemiology, nursing, medicine, and data science. It is important to mention that challenges persist, such as the need for open databases, harmonised methodologies, and analytical capacity to address multiple exposures with short half-lives. However, technological progress and the expansion of AI methodologies anticipate important improvements in the characterisation of the exposome and its application in public health policies.

4 DISCUSSION

The results obtained are consistent with international advances regarding the exposome and make it possible to critically contextualise its relevance, the methodological achievements attained, and the challenges that persist for its implementation in population research. The estimate that approximately 24% of the global burden of disease is attributable to non-genetic exposures fully coincides with the global reports of the WHO and the Global Burden of Disease, which have documented a substantial impact of air, water, and soil pollution on morbidity and mortality worldwide. The figure of around nine million annual

deaths attributed to environmental pollutants concurs with previous reports, which reinforces the urgency of integrating exposome methodologies to understand the complexity of such exposures.

The findings coincide with the literature where the importance of critical susceptibility windows is highlighted, mainly during gestation and childhood. Previous studies have documented physiological, endocrine, and metabolic variations that modulate vulnerability to chemical pollutants and environmental factors during these stages mainly (8, 9, 13). In this sense, the evidence reaffirms that early exposures can stimulate alterations with permanent repercussions on development, which is fully congruent with the results of international projects such as HELIX.

As regards the exposome measurement techniques, the results show a wide adoption of biomonitoring through blood, urine, hair, teeth, nail, placenta, and meconium samples, which coincides with international recommendations that mark the usefulness of diverse biospecimens to reconstruct short- and long-term exposures (12, 14–16). The classification of biomarkers such as: exposure, effect, and susceptibility are congruent with conceptual frameworks established in toxicology and environmental epidemiology, while the incorporation of omics technologies reflects the global trend towards the identification of early biological mechanisms and toxicity pathways (24).

With respect to the international projects, particularly HELIX and LEnS, they demonstrate a remarkable concordance with the literature by highlighting the importance of combining biomarkers, environmental sensors, GIS, and approaches based on critical stages of development. HELIX has been widely recognised as one of the most robust efforts to characterise prenatal and postnatal exposures of European cohorts; and the findings presented —such as the assessment of metals, pesticides, noise, air quality, and green spaces— fully coincide with its comprehensive approach. LEnS contributes an innovative approach through target-organ models, which aligns with the international trend towards a more granular cartography of the human exposome.

An outstanding contribution in the review is the integration of AI, whose results show various predictors similar to those reported in the global literature. The neural networks and clustering algorithms with R^2 values around 0.70 (18) are consistent with what has been observed in atmospheric modelling studies in other regions of the world. Likewise, the accuracy of 82–86% reported by supervised models such as SVM, KNN, and Random Forest (19) is comparable to what has been published internationally on the classification of environmental risks and the reconstruction of exposures in the absence of direct measurements. The additional evidence on the usefulness of GIS and data fusion to map

urban critical points (20, 21) concurs with studies in highly urbanised cities where AI has made it possible to identify vulnerable areas and design focused interventions.

Definitively, the challenges identified —difficulty in measuring substances with short half-lives, the lack of standardised databases, analytical limitations in mass spectrometry, and above all the complexity of multiple risk factors (22, 23)— are problems widely documented in the international literature. The difficulty in capturing and measuring dynamic and multifactorial exposures constitutes one of the most debated methodological terms in the exposome, this being a global problem. However, as various authors suggest, advances in metabolomics, bioinformatics, and AI offer diverse promising perspectives to reduce these gaps in the coming years.

The evidence of the results aligns with the trends identified in the international literature, which reinforces the importance of the exposome as a conceptual and methodological framework, and points to the need to continue strengthening the technical capacities, scientific infrastructure, and multidisciplinary efforts that allow its full application in public health and contemporary epidemiology.

5 CONCLUSION

The exposome has been consolidated as an essential framework for understanding the contribution of non-genetic exposures to the global burden of disease. The evidence agrees that a substantial part of chronic, developmental, and environmental pathologies can be prevented through the identification of risk factors, so that the measurement of and intervention on such exposures throughout the life course are fundamental for prevention. The methodological advances described —including biomonitoring through diverse biospecimens, the use of omics tools, environmental sensors, and high-resolution analytical models— allow the characterisation, in an increasingly precise manner, of the interactions between the environment and human biology.

Likewise, the integration of AI and GIS has emerged as a key and fundamental component for analysing complex exposures, predicting pollutants, and locating risk areas more efficiently. The international studies, particularly HELIX and LEnS, corroborate the relevance of critical susceptibility windows and demonstrate the value of comprehensive approaches that combine biological, environmental, and spatial data. These robust models offer a methodological precedent for future research, especially in contexts where multiple exposures and social factors interact dynamically.

However, despite the advances, important challenges still persist, such as: the limited capacity to measure substances with short half-lives, the lack of harmonised databases, the

analytical complexity of highly heterogeneous samples, and the need to address multiple risks simultaneously. Nonetheless, the accelerated progress in metabolomics, bioinformatics, and AI anticipates a favourable scenario for overcoming these limitations in the coming years.

The exposome represents a strategic opportunity to strengthen epidemiological research, guide evidence-based public policies, and promote more effective preventive interventions. Consolidating this perspective requires sustained investment in scientific infrastructure, interdisciplinary training, and collaborative efforts that make it possible to advance towards a more complete, equitable, and actionable understanding of the exposures that shape human health.

ABSTRACT

This prospective study investigates the availability of educational and instructional manuals on the Brazilian "Lei do Bem" (Law No. 11,196/2005), specifically focused on the reality of Brazilian Scientific and Technological Institutions (STIs). The main objective is to support the originality and relevance of the proposal to develop a manual adapted to the needs of these institutions. The specific objectives were: to conduct a comprehensive documentary survey of existing materials; to identify informational and operational gaps in the application of the Lei do Bem within STIs; to substantiate the need for and originality of the proposed manual; and to suggest preliminary guidelines for its development. The methodology employed an exploratory prospective approach conducted through the gov.br portal, using the Access to Information Law (LAI) to consult Federal Higher Education Institutions (IFES) and Federal Institutes, as well as the Google Scholar platform. The results indicated a complete absence of consolidated and specific manuals on the Lei do Bem on the official websites of the consulted STIs. Existing references are limited to the legislation itself or to the Practical Guide issued by the Ministry of Science, Technology and Innovation (MCTI), whose focus is predominantly directed toward private companies and does not address the operational and pedagogical specificities of STIs. It is concluded that there is a critical institutional gap that reinforces the need for a modern, accessible educational product aligned with the specific demands of STIs, contributing to innovation in teaching and research institutions.

Keywords: Lei do Bem. Scientific and Technological Institutions (STIs). Innovation. Instructional Manual. Technological Forecasting.

RESUMO

O presente estudo prospectivo investiga a disponibilidade de manuais didáticos e orientativos sobre a Lei do Bem (Lei nº 11.196/2005), voltados especificamente para a realidade das Instituições Científicas e Tecnológicas (ICTs) brasileiras. O objetivo central é fundamentar a originalidade e a relevância da proposta de elaboração de um manual adaptado às necessidades dessas instituições. Como objetivos específicos, buscou-se: realizar prospecção documental abrangente sobre materiais existentes; identificar lacunas informacionais e operacionais na aplicação da Lei do Bem em ICTs; fundamentar a necessidade e originalidade do manual proposto; e sugerir diretrizes preliminares para sua

elaboração. A metodologia empregou prospecção exploratória conduzida no portal gov.br, utilizando a Lei de Acesso à Informação (LAI) para consultar as Instituições Federais de Ensino Superior (IFES) e Institutos Federais, além da plataforma Google Acadêmico. Os resultados indicaram ausência total de manuais consolidados e específicos sobre a Lei do Bem nas páginas oficiais das ICTs consultadas. As referências existentes limitam-se à legislação ou ao Guia Prático do MCTI, cujo foco é predominantemente direcionado às empresas privadas, que não aborda as especificidades operacionais e pedagógicas das ICTs. Conclui-se que há lacuna institucional crítica que reforça a necessidade de um produto educacional moderno, acessível e alinhado às demandas específicas das ICTs, contribuindo para inovação nas instituições de ensino e pesquisa.

Palavras-chave: Lei do Bem. Instituições Científicas e Tecnológicas (ICTs). Inovação. Manual Orientativo. Prospecção Tecnológica.

RESUMEN

El presente estudio prospectivo investiga la disponibilidad de manuales didácticos y orientativos sobre la Ley del Bien (Ley n.º 11.196/2005), dirigidos específicamente a la realidad de las Instituciones Científicas y Tecnológicas (ICT) brasileñas. El objetivo central es fundamentar la originalidad y la relevancia de la propuesta de elaboración de un manual adaptado a las necesidades de estas instituciones. Como objetivos específicos, se buscó: realizar una prospección documental integral sobre los materiales existentes; identificar vacíos informativos y operativos en la aplicación de la Ley del Bien en las ICT; fundamentar la necesidad y originalidad del manual propuesto; y sugerir directrices preliminares para su elaboración. La metodología empleó una prospección exploratoria realizada en el portal gov.br, utilizando la Ley de Acceso a la Información (LAI) para consultar a las Instituciones Federales de Educación Superior (IFES) y a los Institutos Federales, así como la plataforma Google Scholar. Los resultados indicaron una ausencia total de manuales consolidados y específicos sobre la Ley del Bien en las páginas oficiales de las ICT consultadas. Las referencias existentes se limitan a la propia legislación o a la Guía Práctica del MCTI, cuyo enfoque está predominantemente dirigido a las empresas privadas y no aborda las especificidades operativas y pedagógicas de las ICT. Se concluye que existe una brecha institucional crítica que refuerza la necesidad de un producto educativo moderno, accesible y alineado con las demandas específicas de las ICT, contribuyendo a la innovación en las instituciones de enseñanza e investigación.

Palabras clave: Ley del Bien. Instituciones Científicas y Tecnológicas (ICT). Innovación. Manual Orientativo. Prospección Tecnológica.

1 INTRODUCTION

Brazilian Scientific and Technological Institutions (STIs) have established themselves as essential pillars for the country's development and economic growth, acting as catalysts for innovation and applied research (Mayrink, 2025). Within the scope of the National System of Science, Technology and Innovation (SNCTI), these institutions, which encompass universities and research institutes, hold a strategic role that transcends the mere production of knowledge, being responsible for a significant portion of national Research and Development (R&D), especially in collaboration with the productive sector.

The relevance of STIs lies in their capacity to generate intellectual capital, laboratory infrastructure and an environment conducive to the interconnection between academia and the market, elements that are crucial for competitiveness (Minghelli *et al.*, 2021).

The strategic function of STIs is particularly evident with regard to the raising of resources and institutional persuasion for investment in innovation. The Legal Framework for Science, Technology and Innovation (Law No. 13,243/2016) and the Lei do Bem itself (Law No. 11,196/2005) establish mechanisms that allow STIs to access extra-budgetary financial resources, whether through grants or through partnerships with companies seeking to benefit from tax incentives.

The technical expertise and credibility of these institutions are determining factors for success in attracting these investments, acting as a vector of trust that validates the quality and the commercial exploitation potential of R&D projects. However, the operationalisation of such resource-raising requires a clear command of the legal and procedural aspects, which is not always consolidated in internal administrative routines.

The lack of clear guidance on procedures for registering and benefiting from the Lei do Bem may result in the underutilisation of the resources available to STIs. The absence of standardised procedures also compromises institutional governance, rendering processes vulnerable to administrative failures and increasing compliance costs. It is estimated that federal institutions fail to raise significant resources owing to a lack of operational clarity, representing a direct loss of investments that could finance research and innovation.

The raising of resources for innovation by federal higher education institutions faces significant structural and cultural obstacles. Institutionally, the resource allocation criteria of agencies such as CNPq and Capes, by prioritising academic qualifications and publication volume, tend to favour regions with already-consolidated infrastructure, hindering access to new funding for institutions located in peripheral regions. Furthermore, "barriers" persist between academic work and private interest, especially related to the need for industrial secrecy and a prejudice regarding the alleged lack of objectivity of researchers (IPEA, 2010).

The IFES are frequently reduced to mere suppliers of qualified labour rather than technological risk partners. Finally, the chronic instability in the flow of resources, historically marked by contingency cuts in the Sectoral Funds, and the precariousness of the mechanisms for transmission between scientific knowledge and corporate technological application limit the effectiveness of universities in the national innovation dynamic (IPEA, 2010).

Currently, the strategic role of Scientific and Technological Institutions (STIs) in fostering innovation is closely linked to the increase in Intellectual Property (IP). According to data from the Statistical Yearbook of Industrial Property of the Instituto Nacional da Propriedade Industrial (INPI, 2024), the Brazilian IP system recorded a total of 27,701 patent applications in 2024, with 12,914 grants, while other IP categories grew significantly: trademark applications reached 444,037 (+10.3%), computer programmes grew by 25.5% and circuit topographies recorded 6 applications (+500%) (INPI, 2024).

STIs are major generators of invention patents and utility models, intangible assets that are fundamental for the protection of knowledge and its subsequent technology transfer to society.

The Lei do Bem, although fundamental, was conceived with a predominant focus on private companies taxed under the Real Profit regime. The prospecting carried out via the Access to Information Law (LAI) revealed a lack of specific educational materials on its application within STIs.

According to Cassiolato and Lastres (2019), the effective appropriation of fostering instruments depends on institutional capacities for interpreting and internalising regulatory requirements. The Practical Guide of the MCTI, although a reference document, does not address the operational, pedagogical and administrative specificities of STIs.

In view of the growing operational complexity that permeates the application of the Lei do Bem in institutional contexts, STIs face structural challenges in the effective implementation of these mechanisms. The Lei do Bem, originally conceived for private companies, requires reinterpretation when applied to public institutions, particularly regarding the eligibility of projects, fiscal documentation, contractual compliance and Intellectual Property management. This interpretative gap compromises the institutional capacity to operationalise the incentives in a safe and strategic manner.

In addition, STIs lack continuous institutional training adapted to the legal, fiscal and administrative complexity involved in managing projects under tax incentives, exposing themselves to audit risks and underutilising their innovation potential.

The concept of innovation has undergone profound transformations in recent decades, shifting from a linear model of technology transfer towards open, collaborative and mission-oriented paradigms (Plonski, 2017). In this new context, STIs assume a central role as articulators of the innovation ecosystem, which requires management instruments compatible with the complexity of contemporary university–enterprise interactions.

In view of this context, the present work prospects the absence of specific manuals on the Lei do Bem in STIs, identifies critical informational gaps in existing pedagogical materials and justifies the relevance and originality of a manual adapted to the managers and researchers of these institutions.

This proposition substantiates the need to translate technical-legal language into clear operational procedures, practical examples and management tools aligned with the institutional reality, thereby supplying internal training, strengthening innovation governance and broadening the effectiveness of public fostering policies within public teaching and research institutions.

The proposed manual, by establishing a practical path for the understanding and effective application of the Lei do Bem, constitutes an unprecedented and essential contribution to the process of institutionalising innovation in Scientific and Technological Institutions (STIs). Its conception aims to supply the gaps in knowledge and the lack of standardisation of procedures, ensuring that these institutions can exercise their strategic role with greater legal certainty and operational efficiency. In this way, the manual can maximise the impact of investments in Research and Development (R&D) on socio-economic development.

2 METHODOLOGY

The methodology adopted in this study combined exploratory research with technological research, aiming not only to deepen knowledge about the application of the Lei do Bem, but also to validate the precedence of the proposed manual, since this is a stage that verifies the non-existence of a similar product in the state of the art (Marques *et al.*, 2015; Procaci, 2016).

To this end, an exhaustive prospecting was carried out across all Federal Higher Education Institutions (IFES) and Federal Universities, covering at least one institution per state of the Federation. The search for information was conducted on the basis of the Access to Information Law (LAI), which ensured the appropriate rigour in verifying the transparency and public availability of the guidance materials.

In addition, a systematic search was carried out in Google Scholar with the descriptors "Lei do Bem" + "manual" and "Lei do Bem" + "ICT" (period 2015–2025, in Portuguese), in which no specific publication on a manual or operational guide for STIs was found.

Data collection was conducted during the period between April and December 2025, rigorously following the stages outlined in Table 1. The search terms for the prospecting were carefully adapted to the specific syntax of each search platform and of the institutional websites. For the organisation, cataloguing and processing of the collected data, the assistance of electronic spreadsheets was used.

Table 1

Description of the stages developed to carry out the precedence search study of digital manuals on the Lei do Bem

STAGE	DEFINITION OF ACTIVITIES
Definition of scope	Search for manuals related to the Lei do Bem for STIs
Definition of the research databases	Database used for searching terms in Portuguese: Fala.Br platform; Google Scholar
Definition of the search terms	"Lei do Bem" "manual"
Tabulation of search results	Organisation and processing of data in electronic spreadsheets
Tabulation of search results	Organisation and processing of data in electronic spreadsheets.
Quantitative analysis of the data	On the existence of manuals and legislation related to the Lei do Bem.
Export of documents	Preserve and cite evidence

Source: prepared by the author, 2025.

The method employed, which uses official documents and governmental sources for analysis, is classified as qualitative documentary research of national scope with a focus on Technological Forecasting, using primary governmental sources. The search was directed to the SouGov.br system, by means of requests based on the Access to Information Law (LAI) (Law No. 12,527/2011), which confers rigour and public endorsement to the data collection. This approach, which uses official documents and governmental sources for analysis, is validated by authors such as Kripka *et al.* (2015) and Yin (2015), who highlight the importance of qualitative documentary research for understanding practices and regulations, with an emphasis on traceable primary sources and stratified purposive sampling.

The scope included the verification of the availability of manuals on the Lei do Bem in IFES and Federal Institutes, with a sample of one institution per state. In the case of the Federal Institutes, the consulted unit was adopted as representative of the totality of the

institutes of the respective federative unit, thereby encompassing the regional diversity of the Federal Network of Professional, Scientific and Technological Education.

The data collection for this study began with the sending of formal requests to the analysed institutions, with the following query: "I request information regarding the existence of manuals, guides or any other official document that guides the application of the Lei do Bem (Law No. 11,196/2005) in the research, development and innovation activities promoted by the institution." From these responses, the available informational bases were identified and analysed, described below according to their main characteristics and relevance to the research.

The consultation of the Gov.br system was carried out through the protocol of formal requests on the Fala.BR platform – Integrated Ombudsman and Access to Information System, as set out in Table 2. Each request was directed individually to the selected institutions, ensuring traceability and an official response. After submission, the responses were monitored within the legal deadlines established by the LAI, allowing the systematisation of the documents and information provided by the consulted entities.

3 RESULTS

3.1 DOCUMENTARY PROSPECTING

The documentary prospecting was conducted in a comprehensive manner, covering 54 Higher Education Institutions (HEIs), being at least one Federal University per federative unit of Brazil, complemented by consultations with Federal Institutes of higher-level Education

in different states. This approach ensured representative coverage of the National System of Higher Education and of the Federalised Teaching System, providing a consolidated view of the Brazilian institutional reality regarding the availability of guidance materials on the Lei do Bem.

The results of the prospecting, carried out through the gov.br portal and instrumentalised by the Access to Information Law (LAI), revealed a critical finding: the complete non-existence of any consolidated, specific and institutionalised manual on the application of the Lei do Bem in the consulted STIs, as can be seen in Table 3:

Table 3

Description of the STIs consulted

REGION	INSTITUTIONS	TOTAL
NORTH	UFAM • UFAC • UFPA • UFRR • UNIR • IFAM • IFAC • IFAP • IFPA • IFRR • IFRO	8

Source: prepared by the author, 2025.

The 54 higher education institutions and the Federal Institutes analysed do not possess, on their official websites or institutional management platforms, standardised educational materials that address the operational, fiscal and administrative complexities of Law No. 11,196/2005 in the context of public institutions. The available references are limited to the Practical Guide of the Ministry of Science, Technology and Innovation (MCTI), which maintains a predominant focus on private companies, not addressing the specificities of public STIs.

This finding unequivocally reinforces the pertinence and originality of developing a manual directed at STIs as an unprecedented and necessary contribution to strengthening innovation actions in public teaching and research institutions. The scope of the prospecting, which included all Brazilian federative units through their federal universities, complemented

by higher-level federal institutes, validates the universality of the identified gap, confirming that the problem is not localised, but structural in the higher education system.

3.2 GAPS IDENTIFIED

Additionally, it is found that, in the responses provided by the universities and federal institutes through Fala.BR, the mentions of Law No. 11,196/2005 (Lei do Bem) are limited to citing the legislation as a regulatory reference or to indicating the Guide of the Ministry of Science, Technology and Innovation (MCTI) as guidance material. Such responses, however, are not accompanied by their own materials, adapted to the specificities of the Scientific and Technological Institutions (STIs), nor by pedagogical approaches that facilitate the understanding and practical application of the legal provisions by researchers, managers and innovation centres.

This exclusive dependence on external documents, devoid of institutional contextualisation and operational examples, evidences a formative gap of a manual with accessible, didactic content aligned with the specific demands of STIs (for examples, see Figures 1 and 2).

As can be seen in Figure 2, UFMG explicitly states the non-existence of manuals, guides or official documents on the application of Law No. 11,196/2005 (Lei do Bem) within the scope of CTIT and, through PROPLAN, affirms that it does not have its own guidelines on the understanding that, owing to tax immunity, the law's tax incentives would not apply directly to the University. This framing reveals a partial understanding of the potential for benefiting from the Lei do Bem from the University's perspective, as it is limited to merely tax issues, disregarding the systemic benefit for society and for the partner companies that invest in R, D&I with the STIs.

Although useful for accounting routines, the internal material cited (on companies' tax withholdings) is instrumental and restricted and does not replace the production of original and pedagogical content that translates the legal provisions into procedures, flows and

operational examples for cooperative projects (such as contracting and agreement templates, proof of eligible expenditure, metrics/TRL, evidence of results, governance and compliance).

This scenario is especially critical considering that innovation incentives in Brazil have already demonstrated a positive impact on the innovative performance of beneficiary companies, with an increase in R&D expenditure and a greater propensity to patent (Kannebley Jr.; Porto, 2012). The existence of proven corporate demand for cooperative projects with STIs makes the operational gap even more pressing: the instrument works, but the institutions lack the capacity to translate it into routines.

By disregarding the Lei do Bem as a public policy instrument for inducing private investment in R, D&I, strengthening cooperation between university and enterprise and generating positive externalities (intellectual property, productive linkages, technological diffusion), the institutional response reinforces the gap of contextualisation and didactic mediation that a specialised manual proposes to supply with accessible, applied guidelines aligned with the specific demands of STIs. Figure 3 presents another example of the current national scenario.

Resposta

Sr em resposta ao pedido de informação, protocolado sob o nº 23546.040681/2025-90, encaminhamos abaixo os esclarecimentos obtidos junto à Diretoria de Pesquisa e Inovação do Instituto Federal de Goiás.

"A Lei nº 11.196/2005, conhecida como a Lei do Bem, regulamentado pelo Decreto nº 5.798, de 7 de junho de 2006, é considerada o principal instrumento de estímulo às atividades de P&D nas empresas brasileiras, isso porque oferece a elas, em seu Capítulo II, a possibilidade de uso de alguns incentivos fiscais, abarcando todas as esferas da economia e regiões do país. Contribui, assim, efetivamente para a inovação, o desenvolvimento da capacidade técnico-produtiva das empresas e o aumento do valor agregado da produção de bens e serviços.

Sendo uma legislação federal, dispensa a necessidade de instrumento específico (ex: manuais) para as Instituições de Ciência e Tecnologia (ICT). No entanto, destacamos a existência dos seguintes documentos que podem orientar seu utilização:

Página do Ministério da Ciência, Tecnologia e Inovação <https://www.gov.br/mcti/pt-br/acompanhe-o-mcti/lei-do-bem/paginas/o-que-e-a-lei-do-bem>

Página da Universidade Federal de Santa Catarina <https://inova.ufsc.br/programas-de-pesquisa-desenvolvimento-e-inovacao/lei-do-bem/>

Guia da Lei do Bem, preparado pela ANPEI https://antigo.mcti.gov.br/mctic/export/sites/institucional/tecnologia/Lei_do_bem/Noticias/Arquivos/Guia-da-lei-do-Bem-ANPEI_2017.pdf.

Source: fala.BR, 2025.

It is observed that the majority of Federal Higher Education Institutions (IFES) and Federal Institutes (IFs) resort, almost exclusively, to official documents, such as the Practical Guide of the Lei do Bem of the MCTI, Decree No. 5,798/2006 and Law No. 11,196/2005, in order to understand and apply the mechanisms of tax incentives for innovation.

Although indispensable as a regulatory basis and general guidance, such references possess a predominantly technical-prescriptive language and little dialogue with the operational and pedagogical specificities of the STIs' routine. The result is an asymmetry between "what the standard requires" and "how to operationalise" within the institutions, especially when there is cooperation with the productive sector.

This dependence on external sources signals a deficit of institutional didactic mediation. In terms of innovation management, this translates into difficulties in standardising procedures, qualifying evidence and building internal capacities.

As argued by Cassiolato and Lastres (2019), the effectiveness of innovation policies requires more than the existence of legal instruments: it requires the institutional capacity to interpret, adapt and internalise these instruments. The absence of original educational materials in the universities and federal institutes evidences limits in this learning trajectory, indicating that the regulatory internalisation of the Lei do Bem is still incipient and poorly systematised.

This gap reduces the strategic capacity of STIs to mobilise tax incentives, affecting the diffusion of knowledge, the articulation with companies and the effectiveness of public policies. In practical terms: without translating technical-legal requirements into routines, tools and management evidence, traction is lost in the qualified use of the instrument; hence the urgency of original, contextualised and practice-oriented content.

3.3 INSTITUTIONAL CAPACITY-BUILDING FOR OPERATIONALISING THE LEI DO BEM: BRIDGING THE GAP BETWEEN STANDARD AND PRACTICE IN STIS

The MCTI Guide standardises incentives at a high level, but its regulatory focus limits direct application in STIs with the productive sector. A manual is needed to complement it, translating technical-legal language into operational procedures, practical examples and adapted tools. This manual aims to promote regulatory internalisation, procedural compliance and the strategic use of the Lei do Bem via evidence trails, decision flows, checklists and institutional templates, reducing interpretative uncertainties.

Aligning with international and national recommendations, the OECD (2019, p. 01) emphasises that "changing citizens' expectations of governments requires new forms of engagement, better and more tailored services and policies that deliver better outcomes", concluding that governments "need to innovate". These guidelines converge on the need to strengthen governance, management and internal capacities in STIs, under penalty of underutilising the existing instruments. In this context, the construction of institutional pedagogical materials becomes a crucial component of the effectiveness of public policies, by translating technical-legal requirements into routines, tools and operational evidence applicable to the daily life of organisations.

As previously stated, a scarcity of educational materials specifically aimed at the application of the Lei do Bem within STIs was found. The only initiative identified is the e-book published by UFES in 2025, whose priority focus is to guide private companies on benefiting from the incentives, addressing the institutional specificities of STIs executing or partnering in R&D in a limited manner (Gracia; Zanotti, 2025). Added to this is the fact that the legislation (Law No. 11,196/2005, Chap. III) and Decree No. 5,798/2006 were conceived

with a preponderant focus on companies, and the MCTI Guide itself reinforces this bias by privileging the accounting and technical proof on the corporate side.

This combination of regulatory and operational gaps hinders the institutional appropriation of the Lei do Bem by the STIs, limiting their potential contribution to the innovation ecosystem. Hence the pertinence of a manual that internally builds the capacity of STIs and strengthens their strategic action in this instrument.

4 FINAL CONSIDERATIONS

Despite the relevance of Law No. 11,196/2005 (Lei do Bem) as an instrument for inducing R, D&I, the Scientific and Technological Institutions (STIs) lack their own pedagogical and operational materials that translate the standard into institutional routines. In light of this diagnosis, the foundations of a practical, accessible manual aligned with the management specificities of STIs are proposed, in order to reduce interpretative uncertainties, qualify compliance and broaden the strategic use of the instrument. Correlatively, the aim was to map, through documentary prospecting via LAI/FalaBR, the existence of manuals, guides and internal flows applied to the Lei do Bem in universities and federal institutes.

The responses via FalaBR converge towards a pattern of strictly regulatory response (Law, Decree and MCTI Guide) without operational didactic mediation, in addition to the absence of original content detailing eligibility, documentation, R, D&I governance, evidence trails and decision flows.

Responses such as that of UFMG reveal a restricted understanding of the scope of the Lei do Bem, limited to its direct inapplicability as an immune entity, disregarding the systemic potential of the instrument to enable cooperative partnerships with the productive sector. The only initiative mapped, the e-book of UFES (2025), guides private companies and does not cover the institutional routines of the STIs.

The set of findings indicates a structural gap, with low regulatory internalisation and limited mobilisation of incentives. This scenario raises the risks of disallowances, hinders the auditability of R, D&I expenditure and delays the diffusion of compliance practices. It is therefore imperative to prepare original technical-pedagogical materials that translate the standard into operational procedures, documentary templates and decision flows, strengthening innovation governance and the execution capacity of STIs.

The results dialogue with the literature and with institutional guidelines: the effectiveness of innovation policies depends on the organisational capacity to interpret, adapt

and internalise legal instruments (Cassiolato & Lastres, 2019), while the OECD (2019) emphasises governance, capacity-building and accountability as conditions for public impact.

In this context, a specific manual for STIs would fulfil the critical function of technical-pedagogical mediation, translating legal-accounting language into operational procedures, checklists, evidence trails, decision flows and documentary templates adherent to the routines of cooperative projects and to the management of Intellectual Property. It would be a knowledge management artefact capable of ensuring compliance, reduction of audit risks, acceleration of decision-making and alignment of internal actors (managers, researchers, support areas).

5 FUTURE PERSPECTIVES

The diagnosis presented confirms a structural gap in innovation management in STIs. As a development of this study, the production of a technical-pedagogical manual aimed specifically at Scientific, Technological and Innovation Institutions (STIs) is proposed, with a focus on the operationalisation of Law No. 11,196/2005 in university–enterprise cooperation contexts. The proposal consists of preparing an applied instrument, capable of translating the legal-accounting provisions of the Lei do Bem into operational flows, documentary templates, evidence trails, compliance checklists and practical guidelines adapted to the institutional routines of STIs.

A relevant perspective consists of the empirical validation of the proposed material in real institutional environments, through pilot projects conducted in federal universities and federal institutes. Such a stage would allow the impact of the manual on indicators such as the reduction of interpretative uncertainties, the standardisation of procedures, the strengthening of innovation governance, the improvement of the auditability of R, D&I expenditure and the broadening of the institutional capacity to interact with partner companies to be assessed.

It is also recommended to deepen comparative research between national STIs and international models of innovation management and tax incentives for research and development, especially in OECD member countries. Studies of this nature may contribute to the identification of institutional good practices related to regulatory internalisation, evidence management, compliance in cooperative projects and technology transfer mechanisms.

Another promising agenda involves the integration of digital solutions and intelligent platforms to support innovation management, including document management systems, automation of procedural flows and digital environments for continuous capacity-building. The

incorporation of digital technologies may broaden the accessibility of the guidelines, reduce informational asymmetries and strengthen the institutional culture of compliance and innovation.

Additionally, it is suggested to investigate the impacts of the absence of technical-operational capacity-building on the effectiveness of public innovation policies in Brazil, considering aspects such as the underutilisation of tax incentives, barriers to STI–enterprise cooperation, accountability difficulties and risks of disallowances in audits. Such investigations may support public policies aimed at strengthening the institutional capacities of STIs and broadening the effectiveness of the Lei do Bem as a strategic instrument for inducing the scientific, technological and economic development of the country.

ABSTRACT

Equine asthma is a chronic respiratory disease with no known cure that, if not adequately treated, may worsen over time and with the degree of exposure to allergens and pathogens. It is characterised by bronchoconstriction and mucus hypersecretion, resulting in respiratory distress and potentially leading to pulmonary remodelling. It is currently classified as mild to moderate asthma (mEA) and severe asthma (sEA), depending on the clinical manifestation presented. Conventional treatment involves the use of corticosteroid anti-inflammatory drugs, bronchodilators and management. Although these treatments are comprehensive and effective, they only control the clinical signs and do not control inflammation over long periods, since they always depend on medication, nutritional care and environmental measures. Regenerative medicine, however, may have more prolonged effects on the inflammatory process and on pulmonary remodelling, aiming at tissue repair and regeneration. Among the available therapies, acellular ones stand out, such as platelet-rich plasma (PRP), alpha-2-macroglobulin (A2M), interleukin-1 receptor antagonist protein (IRAP) and prolotherapy, in addition to cell-based therapies based on mesenchymal stem cells (MSCs). Cell-based therapies are able to stimulate the release of a set of bioactive molecules, the secretomes, composed of cytokines, growth factors, proteins, exosomes and extracellular vesicles. These products exhibit immunomodulatory, anti-inflammatory and regenerative properties, favouring the reduction of oxidative stress, cell apoptosis and pulmonary inflammation. Cell-free therapies, in turn, may exhibit the same immunomodulatory effects but offer advantages such as greater ease of storage, lower immunological risk and greater standardisation compared with the direct use of the cells. Studies in horses demonstrate that the intratracheal administration of bone marrow-derived mononuclear cells and of adipose tissue-derived MSCs reduces pulmonary inflammation, attenuates the clinical signs and modulates the production of inflammatory cytokines. Despite the promising results, challenges persist regarding the standardisation of protocols, cell characterisation, definition of doses, routes of administration and specific regulation. Thus, regenerative medicine represents an innovative and promising therapeutic alternative for equine asthma, although its clinical consolidation depends on further studies that prove its safety, efficacy and reproducibility.

RESUMO

A asma equina é uma enfermidade respiratória crônica, sem cura conhecida e, se não for adequadamente tratada, pode se agravar com o tempo e grau de exposição a alérgenos e patógenos. Ela é caracterizada por broncoconstrição e hipersecreção de muco, resultando em dificuldade respiratória e podendo levar a um remodelamento pulmonar. Atualmente é classificada em asma leve a moderada (mEA) e asma grave (sEA), a depender da manifestação clínica apresentada. O tratamento convencional envolve o uso de antiinflamatórios corticosteróides, broncodilatadores e manejo. Embora os tratamentos sejam abrangentes e eficientes, controlam apenas os sinais clínicos e não controlam a inflamação por longos períodos, pois são sempre dependentes de medicamentos, cuidados nutricionais e ambientais. A medicina regenerativa, no entanto, pode ter efeitos mais prolongados sobre o processo inflamatório e sobre o remodelamento pulmonar, visando a reparação e a regeneração teciduais. Entre as terapias disponíveis destacam-se as acelulares, como plasma rico em plaquetas (PRP), alfa-2-macroglobulina (A2M), proteína antagonista do receptor de interleucina-1 (IRAP) e proloterapia, além das terapias celulares baseadas em células-tronco mesenquimais (CTMs). As terapias celulares são capazes de estimular a liberação de um conjunto de moléculas bioativas, os secretomas, compostos por citocinas, fatores de crescimento, proteínas, exossomos e vesículas extracelulares. Esses produtos apresentam propriedades imunomoduladoras, anti-inflamatórias e regenerativas, favorecendo a redução do estresse oxidativo, da apoptose celular e da inflamação pulmonar. Já as terapias livres de células podem apresentar os mesmos efeitos imunomoduladores, mas apresentam vantagens como maior facilidade de armazenamento, menor risco imunológico e maior padronização em comparação ao uso direto das células. Estudos em equinos demonstram que a administração intratraqueal de células mononucleares da medula óssea e de CTMs derivadas do tecido adiposo reduz a inflamação pulmonar, atenua os sinais clínicos e modula a produção de citocinas inflamatórias. Apesar dos resultados promissores, persistem desafios relacionados à padronização dos protocolos, caracterização celular, definição de doses, vias de administração e regulamentação específica. Assim, a medicina regenerativa representa uma alternativa terapêutica inovadora e promissora para a asma equina, embora sua consolidação clínica dependa de novos estudos que comprovem sua segurança, eficácia e reprodutibilidade.

RESUMEN

El asma equina es una enfermedad respiratoria crónica, sin cura conocida y, si no se trata adecuadamente, puede agravarse con el tiempo y el grado de exposición a alérgenos y patógenos. Se caracteriza por broncoconstricción e hipersecreción de moco, lo que resulta en dificultad respiratoria y puede llevar a un remodelamiento pulmonar. Actualmente se clasifica en asma leve a moderada (mEA) y asma grave (sEA), según la manifestación clínica presentada. El tratamiento convencional implica el uso de antiinflamatorios corticosteroides, broncodilatadores y manejo. Aunque los tratamientos son amplios y eficientes, solo controlan los signos clínicos y no controlan la inflamación por largos períodos, pues siempre dependen de medicamentos, cuidados nutricionales y ambientales. La medicina regenerativa, sin embargo, puede tener efectos más prolongados sobre el proceso inflamatorio y sobre el remodelamiento pulmonar, con el objetivo de la reparación y regeneración tisular. Entre las terapias disponibles se destacan las acelulares, como el plasma rico en plaquetas (PRP), la alfa-2-macroglobulina (A2M), la proteína antagonista del receptor de interleucina-1 (IRAP) y la proloterapia, además de las terapias celulares basadas en células madre mesenquimales.

(CMM). Las terapias celulares son capaces de estimular la liberación de un conjunto de moléculas bioactivas, los secretomas, compuestos por citocinas, factores de crecimiento, proteínas, exosomas y vesículas extracelulares. Estos productos presentan propiedades inmunomoduladoras, antiinflamatorias y regenerativas, favoreciendo la reducción del estrés oxidativo, de la apoptosis celular y de la inflamación pulmonar. Por su parte, las terapias libres de células pueden presentar los mismos efectos inmunomoduladores, pero ofrecen ventajas como mayor facilidad de almacenamiento, menor riesgo inmunológico y mayor estandarización en comparación con el uso directo de las células. Estudios en equinos demuestran que la administración intratraqueal de células mononucleares de la médula ósea y de CMM derivadas del tejido adiposo reduce la inflamación pulmonar, atenúa los signos clínicos y modula la producción de citocinas inflamatorias. A pesar de los resultados prometedores, persisten desafíos relacionados con la estandarización de los protocolos, la caracterización celular, la definición de dosis, las vías de administración y la regulación específica. Así, la medicina regenerativa representa una alternativa terapéutica innovadora y prometedora para el asma equina, aunque su consolidación clínica depende de nuevos estudios que comprueben su seguridad, eficacia y reproducibilidad.

1 EQUINE ASTHMA

Asthma is a chronic and multifactorial respiratory disease, characterised by recurrent episodes of respiratory distress, resulting from bronchoconstriction, mucus hypersecretion, inflammatory infiltrate and remodelling of the pulmonary tissue. It can naturally affect horses, cats and humans, and can be artificially induced in other species, including dogs, sheep and rodents (Woodrow *et al.*, 2023).

It may manifest in the mild/moderate (mild/moderate asthma; mEA) or severe (severe equine asthma; sEA) forms, with subtle clinical signs, such as exercise intolerance, up to quite evident signs, such as coughing, nasal discharge and dyspnoea, presented intermittently with episodes lasting from days to months (Mańkowska & Witkowska, 2024). In horses, the described prevalence is from 14% to 80% (Ivester *et al.*, 2018), with the severe form of the disease potentially affecting 20% of horses over 7 years of age (Couetil *et al.*, 2020).

Chronic bronchitis or bronchiolitis were once terms used for the disease and, in the foreign literature, the term 'heaves', or 'chronic obstructive pulmonary disease – COPD', can also be found, the latter no longer being used since the International Workshop on Equine Chronic Airway Disease that took place at the University of Michigan in the year 2000 (Kinnison 2022). At that event, researchers in the field understood that COPD was a disease related to humans, characterised by chronic irreversible airway alterations, usually related to cigarette use (Wu *et al.*, 2024), which did not correspond to the equivalent condition in horses. Two new designations were proposed: Inflammatory Airway Disease (IAD), which affects horses of any age, especially of working age and younger, and Recurrent Airway Obstruction (RAO) for the more severe condition where recurrent episodes of respiratory distress are observed at rest. Over the last 10 years, IAD and RAO have been encompassed as different stages or presentations of the same disease, Equine Asthma (EA), or Equine Asthma Syndrome, given the clinical and pathological similarities between the disease in horses and in humans. Currently, the terms mild to moderate asthma – mEA or severe asthma – sEA are used, as mentioned previously (Kinnison 2022). Now, beyond the phenotypes of asthma, we are moving towards a classification of endotypes, which is used to describe a subtype of the disease involving its molecular mechanisms, genetic variations or response to treatment (Couetil *et al.*, 2020).

Both the diagnosis and the treatment of equine asthma constitute challenges for the clinician. The former involves a thorough physical examination with a detailed history of the patient, followed by complementary endoscopic examinations and cytology of airway secretion samples, whether from a tracheal wash or a bronchoalveolar lavage. Once the

diagnosis is confirmed, an appropriate therapeutic plan can be devised, for the control of the clinical signs of respiratory distress and for the control of inflammation. In the severe form of the disease, bronchodilators are employed. In both forms of asthma, the control of inflammation is fundamental, since it is the inflammatory response that leads to the increased production of mucus observed in the trachea and bronchi, and that obstructs the small airways, interfering with gas exchange; the chronic inflammatory process is responsible for the pulmonary tissue alterations that worsen with age. In this sense, corticosteroids have been the mainstay for the control of chronic pulmonary inflammation, but their use is indicated for the control of the disease and cannot be maintained over long periods. Acetylcysteine, omega-3 fatty acids, immunostimulants and acupuncture may be associated. In any case, the control of the disease must necessarily be accompanied by environmental improvements regarding ventilation, hygiene and reduction of dust from the bedding, the workplace and especially the hay.

2 REGENERATIVE THERAPIES AND EQUINE VETERINARY MEDICINE

Regenerative Medicine (RM) is a generic term that has been used to encompass several therapies, among which are cell-based therapies, which include the use of stem cells, and the non-cellular ones, which include: prolotherapy, platelet-rich plasma (PRP) therapy, alpha-2-macroglobulin (A2M), interleukin-1 receptor antagonist protein (IRAP) and stem cell therapy (DeChellis e Cortazzo 2011).

Prolotherapy can be summarised as the stimulation of tissue repair through the injection of substances into wounds, tendons and joints for the recovery of an injury or the attenuation of pain (Fullerton e Reeves, 2010). Several agents are used in prolotherapy, some classified as irritants (phenol), chemotactics (sodium morrhuate) and others as osmotic agents (dextrose) (Siadat & Isseroff, 2019).

PRP is a component of plasma with 3 to 7 times more platelets than whole blood and contains growth factors, histamine, serotonin, calcium, zinc, superoxide dismutase (SOD) and adenosine triphosphate (ATP), being employed in several areas, from mammalian reproduction to dermatology and orthopaedics (Sajjad *et al.*, 2024). PRP acts on healing and tissue repair, since, in addition to growth factors, it contains cytokines, which are essential for wound healing (Brissett e Hom, 2003). However, its composition may vary significantly, depending on the donor individual, the form of collection and the processing of the material (Perinelli *et al.*, 2020; Serteyn *et al.*, 2026).

Therapies based on alpha-2-macroglobulin (A2M) and on interleukin-1 receptor antagonist protein (IRAP) have been proposed for osteopathies, joint diseases and

tendon/ligament injuries to prevent degrading effects after injuries, since, like PRP, they have growth factors and a diversity of interleukins in their compositions, promoting a reparative and immunomodulatory effect (Barot *et al.*, 2025).

The efficacy of autologous blood-derived products is directly related to the profile and quantity of cytokines and growth factors released by the platelets and leucocytes. Some of these compounds are commercially available, including platelet-rich plasma (PRP; Restigen; Zoetis), autologous protein solution (APS; Pro-Stride; Zoetis) and autologous conditioned plasma (ACP; Arthrex ACP) and, more recently, conditioned A2M (CA2M; Alpha2EQ; Astaria Global) (Barot *et al.*, 2025).

While the previous therapies have their main focus on tissue repair, stem cell therapy has its focus on tissue regeneration (Fortier e Smith, 2008; Krafts 2010; SerTEYN *et al.*, 2026), having an application of several cell types and their products, employed in different ailments (Voga *et al.*, 2020).

3 CELL-FREE THERAPIES

3.1 PLATELET-RICH PLASMA – PRP

Autologous platelet-rich plasma (PRP) is a processed liquid fraction of autologous peripheral blood, with a platelet concentration above that found in baseline measurements (Marx, 2001). Therapies with PRP have been employed for more than 30 years in regenerative medicine (Everts *et al.*, 2020) and veterinary medicine (Tambella *et al.*, 2018).

PRP preparations have been employed in equine medicine especially for musculoskeletal problems. In the study by Maia *et al.* (2009), PRP was applied to injuries of the superficial digital flexor tendon; for this, blood was collected in tubes containing sodium citrate, and underwent a double centrifugation process, the first at 120g for 5 minutes and the second at 473g for 5 minutes.

The use of PRP in the airways is described especially for healing in surgical procedures, such as that proposed for laryngotracheal reconstruction in a model with laboratory animals (Onder *et al.*, 2020).

The use applied to pulmonary treatment was initially suggested by Dzyekanski *et al.* (2012), proposing that the anti-inflammatory effects inherent to PRP would benefit horses with mild to moderate asthma, previously known as inflammatory airway disease (IAD). In that study, 10 horses attended in routine practice were investigated, as they were presenting coughing. The animals underwent a thorough physical examination, followed by endoscopic evaluation of the airways, and cytological evaluation of the bronchoalveolar lavage fluid (BALF). The PRP was obtained from peripheral blood collected from the jugular vein and

placed in tubes containing citrate phosphate dextrose adenine (CPDA) anticoagulant solution, and processing by double centrifugation at 210g for 10 minutes followed by 300g for 10 minutes, at room temperature. In a procedure guided by endoscopy, 20 ml of PRP suspension were instilled in the region of the tracheal bifurcation, directed to the right and left main bronchi. The study showed positive effects of PRP in the horses that were identified with pulmonary inflammation related to mEA, but not in those with severe asthma. Additionally, it left the suggestion that the use of PRP could also benefit horses with exercise-induced pulmonary haemorrhage (EIPH), through the decrease in the percentage number of haemosiderophages in the BALF at the re-evaluation seven days after treatment.

Recently, Pires *et al.* (2021) employed PRP instilled by the tracheal route in 37 Thoroughbred racehorses diagnosed with EIPH. In that study, PRP was obtained using the double centrifugation technique at 120g and 240g for 10 minutes each, and 10 ml of the PRP suspension was instilled in the region of the tracheal bifurcation. All horses were evaluated by means of endoscopic examination of the airways within 60 minutes after racing, and cytology of the tracheal wash performed 72 hours afterwards; concomitantly with the PRP treatment, furosemide was administered according to its own regulation, and again the previous procedures, endoscopy after a second race (between 3 and 5 weeks after the PRP instillation) and cytology of the tracheal wash, at the same times. The addition of PRP treatment to the furosemide injection proved beneficial, reducing the intensity of EIPH in 26% of the cases.

The two studies using PRP evidenced promising effects, but with important limitations in both, such as a reduced number of animals, variables influencing the observed results, non-constant re-evaluation periods, uncontrolled exercise intensity — in short, requiring further research with better control of the variables involved.

4 CELLULAR PRODUCTS

In recent years, mesenchymal stem cells (MSCs) have been highlighted for their capacity to secrete various bioactive molecules into the surrounding environment, and this product came to be called conditioned medium, secretome or cell-free therapy. In this sense, in diseases that involve an inflammatory infiltrate, as in equine asthma, the importance of the secretion of immunomodulatory factors is mentioned, also called the paracrine effect of MSCs (Barussi *et al.*, 2016).

The secretome of MSCs may contain cytokines, chemokines, cell adhesion molecules, lipid mediators, interleukins, growth factors, hormones, proteins, exosomes, microvesicles and extracellular vesicles. These factors were considered protagonists in tissue repair and

regeneration through their paracrine actions that mediate cell-to-cell signalling (Cai *et al.*, 2020; Kumar *et al.* 2019).

The use of cell-free therapies may generate as a response cell proliferation, migration and angiogenesis; suppression of cell apoptosis and inflammation; tissue regeneration; reduction of oxidative stress and immune regulation (Cai *et al.*, 2020; Kumar *et al.* 2019).

In addition to the responses that this type of therapy may generate, the secretome presents some advantages compared with the use of MSCs. Its obtention can be carried out in larger quantities, reducing the variability between donors; it has greater ease of transport and storage; it can be safely used in allogeneic transplants and it eliminates the risk of clot formation (Cai *et al.*, 2020; Cargnoni *et al.*, 2012). It is currently understood that MSCs need to be activated by pro-inflammatory cytokines present in the microenvironment in order to exhibit their immunomodulatory effects (Del Fattore *et al.*, 2015). In this sense, as they are not living cells, but rather cellular products that transport specific paracrine signals, the immunomodulatory effects of the secretome may be expected to be less dependent on the microenvironment and, therefore, more predictable. Thus, they circumvent major obstacles of the clinical use of MSCs: the need for procedures to harvest autologous cells and the cultivation time until application (Kay *et al.*, 2017).

However, one concern regarding the published studies is the standardisation of the cultivation conditions. Lately, in order to avoid the risk of immunological reactions and to eliminate the transmission of zoonotic diseases due to the use of foetal bovine serum (FBS), MSCs are increasingly being propagated in xenogeneic-free medium; thus, it is not clear whether the data obtained in clinical trials based on MSCs cultivated with FBS would be comparable to the data obtained with MSCs cultivated in xenogeneic-free medium. Furthermore, MSCs differ significantly in their gene expression patterns and, not unexpectedly, also demonstrate heterogeneity in the secretome profile, with the differences attributable to the source of the cells and the age of the donor (Kumar *et al.*, 2019).

Nevertheless, this approach, especially in the veterinary sphere, is still in its early stages. Only recently has the therapeutic use of the MSC secretome, instead of the parental cells, been proposed for veterinary applications. In the equine clinic, one study has already described the use of conditioned medium in ligament and tendon injuries with favourable results (Lange-Consiglio *et al.*, 2013). However, other studies continue to be published only with *in vitro* approaches (Bastos *et al.*, 2020; Mocchi *et al.*, 2021) and, so far, no research has been directed towards the use in respiratory conditions.

5 CELL-BASED THERAPIES

It is interesting to point out that, although there is regulation and careful recommendations made by the Conselho Federal de Medicina Veterinária – CFMV for the use of cell therapy in animals, there are no specific bodies and regulations regarding the standardisation and/or recommendations of quantities/doses, cell types, and especially quality control of the biological material used in veterinary medicine. Some animal species (dogs, cats, horses and rabbits) can be extremely important as preclinical models of human diseases, and, in some cases, serve this purpose better than commonly used laboratory animals (Fortier e Travis, 2011).

In human medicine, there are bodies that oversee and regulate the use of cell therapy, such as the Food and Drug Administration (FDA) in the United States and the Ministério da Saúde/Agência Nacional de Vigilância Sanitária (ANVISA) in Brazil, whereas in veterinary medicine there is no such care. Thus, veterinarians may offer 'cell therapies' using stem cells of various origins as well as in varying doses for several species without concrete evidence of the efficacy of many of these procedures (Fortier, L. A., e Travis, A. J. 2011).

When we speak of cell-based therapies, we have two spheres: one is that of non-cultured or non-expanded cells, and the other is that of cultured and expanded cells and their cellular products. Therapies made from non-expanded cells have a heterogeneity of cell populations, a rapid processing time, facilitating the treatment of acute injuries and reducing costs, with almost exclusively autologous use, with a pool of HSCs and MSCs, possessing haematopoietic, angiogenic and immunomodulatory properties (Borjesson e Peroni 2011). Therapies made from expanded cells, on the other hand, have a large quantity of MSCs, are well known for their immunomodulatory capacities, and can be applied in an autologous, allogeneic or xenogeneic manner; however, the expansion of MSCs can take weeks, thus preventing the immediate use of these cells (Lin *et al.*, 2012). In addition to the high number of MSCs, another advantage of expanded cultures is the addition of other compounds that can potentiate the therapy (Borjesson e Peroni 2011).

The International Society for Cellular Therapy (ISCT) has three minimum criteria to define a population of human MSCs: adherence to plastic; differentiation into adipogenic, chondrogenic and osteogenic lineages; high expression of the surface markers CD73, CD90 and CD105 (above 95%), and low expression of CD34, CD45, CD14 or CD11b, MHC-II and CD19 or CD79 α (below 2%). However, according to Dominici *et al.* (2006), the expression of surface antigens is not universally well characterised and the recommended antigens may not apply to other species. For equine MSCs, the difficulty in characterising the cells is observed due to the limited availability of species-specific monoclonal antibodies (mAb), as

demonstrated by the study of De Schauwer *et al.* (2012), in which the cross-reactivity of 30 commercial mAbs for the recognition of equine epitopes was studied. As a result, only 11 antibodies presented satisfactory results.

The study by Bastos *et al.* (2020) carried out the immunophenotypic characterisation of equine bone marrow MSCs by flow cytometry, using the following mAbs (Figure 1): anti-human CD90, anti-human CD19, anti-human CD14, anti-horse CD105, anti-horse CD45 and anti-human HLA-DR (Dominici *et al.*, 2006). The panel was assembled after a pilot assay, in which the labelling of mononuclear cells and mesenchymal cells with several available antibodies was carried out. After the pilot, CD73, CD166 and CD29 were excluded from the study for not presenting the expected reactivity. The anti-human mAbs CD45 and CD105 also did not present the expected reactivity, but other clones were found that presented cross-reactivity with the horse.

Figure 1

Immunophenotypic characterisation of equine bone marrow mesenchymal stromal cells, evaluated by flow cytometry. Representative histograms of one sample from the study, analysed at the third passage. The peaks in blue indicate the percentage of the population positive for each antibody, while the peaks in red indicate the isotype control of the antibodies. CD90 and CD105 proved positive, while HLA-DR, CD14, CD19 and CD45 proved negative (low expression). CD = clusters of cell differentiation; HLA = human leucocyte antigen

Source: prepared by the authors.

In the literature, the labelling for CD90 in equine cells was carried out with several different mAbs, also obtaining different results. Expressions above 90% were obtained for

equine MSCs with anti-human CD90 (100%, Bastos *et al.*, 2020; 96%, Cabezas *et al.*, 2018; 90%, Ranera *et al.*, 2011), anti-rat (98.2%, Barberini *et al.*, 2014) and anti-dog (91.34%, Carrade *et al.*, 2012).

Regarding the CD45 marker, there are results close to that recommended by the ISCT, with labelling below 2%, using anti-human antibodies (Ranera *et al.*, 2011; Paebst *et al.*, 2014) or anti-mouse (Cabezas *et al.*, 2018). In the study by Bastos *et al.* (2020), using an anti-horse antibody, the CD45 marker was above the limit recommended by the ISCT, but below 10%, which is the limit used in laboratories licensed by ANVISA.

The CD105 marker is the one that presents the greatest discrepancy in the results already published for equine MSCs. Using anti-human antibodies, the work of Ranera *et al.* (2011) obtained no reading for CD105, Paebst *et al.* (2014) obtained results below 0.85% and Cabezas *et al.* (2018) obtained an average of 23.86%. Higher expressions were obtained in the work of Xie *et al.* (2013), with an average of 64%, but still outside what is recommended by both the ISCT and ANVISA (95% and 70%, respectively). Only the article by Barberini *et al.* (2014) demonstrated expressions above 95% (average of 97.7%). The study by Bastos *et al.* (2020), in turn, used CD105 with reactivity for the horse and achieved readings above 95% in all the samples analysed.

Only the studies of Paebst *et al.* (2014) and Bastos *et al.* (2020) labelled equine MSCs with CD14. The results were below 2%, as expected, even with the use of different clones (clone 134620 vs. M5E2, respectively).

The negative markers CD19 and HLA-DR were only described in the work of Bastos *et al.* (2020). CD19 presented consistent results below 2%. HLA-DR, in turn, had considerable variability in the readings, but all were below 10%. The results for the negative markers must be interpreted with caution, since, due to the absence of species-specific mAbs, the low expression may be a result of the absence of cross-reactivity (Ranera *et al.*, 2011). In this sense, the labelling of mononuclear cells as a control is of great importance.

5.1 AUTOLOGOUS VS. ALLOGENEIC VS. XENOGENEIC

To choose the best cell therapy to be employed in a given pathology, it is necessary to weigh some factors such as: the most indicated cell type, the most indicated modality (autologous vs. allogeneic vs. xenogeneic), the cost of the therapy, the possibility of collection for autologous use, the existence of donors for the allogeneic and xenogeneic modalities, an adequate facility for processing the cellular material, a trained team for the application of the therapy and for follow-up of the patient.

Among the arguments that justify the choice of using autologous or allogeneic therapies, which are the most commonly used and the most indicated in veterinary medicine, at least so far, are that: the use of allogeneic MSCs includes a greater risk of immunological reactions and shorter cell survival times after injection; while the use of allogeneic MSCs includes the capacity to store cells, reduce treatment time and collect MSCs from younger and healthier donor animals (Colbath *et al.*, 2020).

While the use of autologous and allogeneic stem cells is increasingly established, the use of xenogeneic cells is still controversial. In a study carried out with autologous, allogeneic and xenogeneic bone marrow-derived mesenchymal stem cells (BMMSCs), applied intra-articularly in horses, it was concluded that there was an immune response in joint samples, collected by synovial biopsies obtained by arthroscopy 60 days after treatment (macroscopic, histological and molecular analyses) after the re-exposure of the group to xenogeneic MSCs, but not to allogeneic or autologous MSCs (Pigott, *et al.*, 2013).

Even though it is commonly employed, the use of allogeneic MSCs still draws attention, since some studies report evidence of inflammatory reactions or adverse clinical responses when allogeneic MSCs are administered and compared with autologous MSCs (Joswig *et al.*, 2017; Van Hecke *et al.* 2021). In this whole scenario, a small detail can make a big difference: the type of vehicle to carry the MSCs. In the study by Van Hecke and collaborators (2021), significant alterations were detected in the use of allogeneic intra-articular cell therapy that used allogeneic plasma in its composition, which prompts questions about the differences between autologous versus allogeneic therapies.

Even though they are commonly employed, the use of allogeneic MSCs still draws attention, being continuously studied, since each methodology employed brings peculiarities and distinct, sometimes divergent, results (Joswig *et al.*, 2017; Van Hecke *et al.* 2021).

The safe use of allogeneic MSCs was described in humans and horses (Carrade *et al.*, 2011a; Carrade *et al.*, 2011b; Fang *et al.*, 2007). When using allogeneic MSCs, we have the opportunity to select high-quality MSCs and perform viral and bacteriological examinations at the time when the stem cell samples are frozen. Since MSCs are present in a limited way (in number in natural sources), *in vitro* expansion is necessary, taking from weeks to months, requiring a programmed application, demanding preservation and making applications immediately after the collection of the material unfeasible (Gugjoo *et al.* 2016; Perez-Silos *et al.* 2016).

6 COLLECTION AND PROCESSING OF CELLULAR MATERIAL

Before beginning this subject, it is relevant to say that there are recommended techniques for each type of collection and material to be used, but there are also variations of them that can and should be taken into consideration, depending on the conditions of the patient, the therapy, the costs or the objectives of the research.

The choices must also be based on the type of stem cell that one intends to work with, since different types of stem cells can lead to different results. Among the types of cells are: haematopoietic stem cells (HSCs), embryonic stem cells (ESCs), mesenchymal stem cells (MSCs) and induced pluripotent stem cells (iPS). The types of cells differ in their capacity for replication and differentiation, tissue of origin and therapeutic indications (Borjesson e Peroni 2011).

As for costs, it can be said that the more time, structure, labour and storage time the stem cells demand, the higher the costs become. In addition to cells, cellular products are used in regenerative veterinary medicine; thus, there is a growing search for the improvement of techniques and compounds that aim to increase productivity and its flexibility (Bradley *et al.*, 2010).

The collection process begins with the donation of tissues coming from veterinary or human hospitals (in the case of xenogeneic cells) or from veterinarians who carry out collections in animals of their routine (necessarily with the written consent of the owners); it is also necessary for everything to be approved by an animal use ethics committee. The cells are then sent to companies or teaching and research institutions, where, in specialised laboratories, they will be processed, stored and prepared for application.

6.1 PERIPHERAL BLOOD

The choice of peripheral blood as a source of stem cells may be related to the low cost and the ease of obtaining the blood tissue. Although this obtention is relatively easy and cheap, the stem cells contained in this tissue are present in smaller quantities when compared with other sources (bone marrow, adipose tissue and umbilical cord); this requires the cells to undergo cultivation, where they will be expanded and subsequently characterised.

Peripheral blood is a source of mononuclear cells (MNCs) that possess HSCs, capable of differentiating into all types of blood cells, and MSCs, capable of differentiating into three lineages: bone, cartilage and adipose (Dhar *et al.*, 2021). In clinical routine, the most used are the MSCs, indicated for the treatment of tendons, ligaments, bone pathologies and cartilage defects (Martinello *et al.*, 2009; Spaas *et al.*, 2011).

Equine blood is commonly collected by venepuncture of the jugular into anticoagulant (usually Heparin) and then sedimented or centrifuged, and from there the sample is processed according to the fraction of cells that one wishes to obtain (Dhar *et al.*, 2021; Koerner *et al.*, 2006; Martinello *et al.*, 2009; Spaas *et al.*, 2011).

6.2 BONE MARROW

Bone marrow (BM), in equine veterinary medicine, is used both for the obtention of MNCs (without cultivation) and MSCs (after cultivation). The volume of marrow to be collected depends on the type and quantity of cells to be applied. While the dose of MSCs employed intra-articularly in osteoarticular injuries is around 10×10^6 cells (Bertoni *et al.* 2021; Joswig *et al.* 2017), the dose of MNCs applied intratracheally in horses with severe asthma was between 5 and 10×10^8 cells (Barussi *et al.*, 2019). Thus, the volume of BM obtained in a single collection usually varies from 5 to 30 mL per horse (Bastos *et al.* 2017); however, Barussi and collaborators (2016) collected 200 mL of BM, justified by the need for a large volume of MNCs for autologous transplant. As the therapy required a large volume of BM, the source chosen was the sternum. The iliac crest was also tested as a source of BM, but the difficulty of obtaining material was much greater, leading the group to conclude that this site, although easily accessible, is more indicated for small quantities.

The horses were kept fasting for at least six hours before the procedure, for sedation with 1% acepromazine intravenously (IV). The collection site between the fourth and sixth sternbrae was clipped, followed by local subcutaneous anaesthesia with 8 mL of 2% lidocaine hydrochloride and antisepsis with degerming povidone-iodine and alcohol. Afterwards, the sedation was complemented with 10% xylazine IV and 5% pethidine hydrochloride IV.

For the puncture, an 11G Jamshidi needle for BM biopsy and collection and 20 mL syringes previously filled with 7 mL of Iscove's Modified Dulbecco's Medium (IMDM) and 0.35 mL of sodium heparin 5000 IU/mL were used. Once collected, the BM was taken to the laboratory under refrigeration, where the mononuclear fraction was isolated by density gradient and subsequently cryopreserved at -192°C .

6.3 ADIPOSE TISSUE

The removal of adipose tissue (AT) is usually carried out in the region above the dorsal gluteal muscle near the base of the tail, since it is easily accessible, is not supplied by large vessels and has great availability of material (Carvalho *et al.* 2009). The animals are kept

under sedation and receive local anaesthesia in an inverted 'L' shape using 2% lidocaine hydrochloride. The AT can be collected by liposuction or surgical procedure.

In cases of liposuction, after clipping, antisepsis and local anaesthesia, the region receives an injection of a fluid composed of sterile 9% NaCl, 2% lidocaine hydrochloride and epinephrine. When the site is uniformly expanded and becomes relatively hyperechoic on ultrasound, the collection proceeds. A minimum of 20 min allows for optimal anaesthesia, haemostasis (via vasoconstriction) and local fluid. Using a sterile technique, the harvest aspiration cannula (Cobra Bibevel) is connected to an empty syringe, ensuring that there is no fluid present to weaken the suction. Once at the site within the adipose layer, the plunger of the syringe is pulled back to create adequate suction pressure. With ultrasound visualisation, the cannula is moved to collect the AT. The same steps for aspiration are then repeated on the contralateral side (J. Lawver and R. Thaler 2015).

In the surgical collection, after clipping, antisepsis and local anaesthesia, the region is accessed by a small incision between 10 and 15 cm in length, allowing the visualisation of the AT between the skin and the musculature. A sample of AT is removed, placing it immersed in culture medium until it is processed. The skin is sutured with nylon thread in simple interrupted stitches.

6.4 FOETAL ADNEXA

The material collected from foetal adnexa may involve umbilical cord blood, Wharton's jelly (umbilical cord tissue), the placenta and the amniotic fluid. Among this range of materials, there are different types of processing, but all of them involve cell isolation and cultivation, significantly impacting the difference in costs and results (Iacono *et al.*, 2012). In a study carried out by Bertoni and collaborators (2021), the therapeutic efficiency of the use of bone marrow-derived stem cells was greater than those derived from umbilical cord.

The amniotic fluid is collected, purified (to eliminate urinary residues and crystals), the cells are isolated and then taken to cultivation. The umbilical cord blood must be collected quickly, since after birth there is a collapse of the umbilical vein. The cells are isolated, washed several times to eliminate other cell types (non-adherent) and taken to cultivation. As the birth canal, as well as the environment, are non-sterile conditions, this represents a great risk of contamination, and it is not difficult to lose samples and cultures as a result of contamination (Iacono *et al.*, 2012).

Although there are studies with foetal adnexa as sources of stem cells, there are no reports of the use of these materials for the treatment of airway diseases in horses, probably because the cost of processing and obtaining the adequate number of cells is a limiting factor.

7 WHEN AND WHY TO OPT FOR CELL THERAPY

Discuss the therapeutic planning (early collection, at a healthy stage), the morphology (which, even cryopreserved, remains stable in BMMC and up to P3 in MSCs); however, discuss cell viability (which decreases over time). It may be worth highlighting the choice of source (adipose tissue, bone marrow or peripheral blood) based on a possible response profile (neovascularisation, tissue formation or immunomodulation).

Table 1

Triage of cell therapy according to clinical urgency, examples and indicated therapy

TRIAGE	EXAMPLES	INDICATED THERAPY
URGENT THERAPY	Corneal ulcer, deep wounds, exercise-induced pulmonary haemorrhage, ligament and tendon diseases.	Cryopreserved autologous BMMC or MSC, fresh BMMC, allogeneic or xenogeneic MSC.
LITTLE-URGENT THERAPY	Equine metabolic syndrome, asthma, wounds with difficult healing, exercise-induced pulmonary haemorrhage, ligament and tendon diseases.	Fresh or cryopreserved autologous BMMC or MSC, allogeneic MSC.
NON-URGENT THERAPY	Asthma, muscular, ligament and tendon diseases.	Fresh or cryopreserved autologous BMMC or MSC, allogeneic MSC.

7.1 PROFILE OF THE PATIENT INDICATED FOR CELL THERAPY

Cell-based therapies represent a possible therapeutic option for many diseases in veterinary medicine, including neoplasms, orthopaedic, digestive, hepatic, renal, cardiac, respiratory, neuromuscular, dermal, olfactory and reproductive system diseases. Although we are progressively understanding the behaviour of stem cells and their mechanisms of action, some of the questions regarding their use are in constant refinement.

There is also a possible influence of age and sex on the results of cell therapy, which should be clarified in future studies.

And the equation of type of disease x therapeutic indications x dosage – number of cells and frequency of application x condition of the patient is what makes the veterinarian consider or not cell therapy as a viable alternative.

- a) TYPE OF DISEASE – determine whether the disease presented by the patient has a profile indicated to receive cell therapy.

- b) THERAPEUTIC INDICATIONS – know whether there are no traditionally known methods that can be applied and offer good recovery rates to the patient. In the case of an indication for the use of cell therapy, know which would be the most indicated types.
- c) DOSAGE – according to the type of disease and therapeutic indications, carry out a survey of the most used practices regarding the number of cells, forms (injected, instilled, inhaled, etc.) and repetitions of the applications.
- d) CONDITION OF THE PATIENT – understand the condition of the patient to know whether it has the conditions to be its own donor (autologous therapies), whether another donor of the same species should be an alternative (allogeneic transplants) or even a donor of another species (xenogeneic transplant). This understanding includes taking into account the age of the patient, the general state of health, and the exposure to a possible collection and transplant procedure.

In general, cell transplants involve simple procedures, with sedation and local anaesthesia. However, they require knowledge and expertise from the veterinarian, demanding knowledge and good practices in their performance. Thus, there are no major restrictions on the application of cell therapy in horses, especially if the modality is allogeneic transplant. The greatest restrictions are for elderly and ill patients, who already have debilitated health (especially due to degenerative, progressive diseases with no established cure), since the effects of these diseases on the patients' immune system and their cellular response are unknown, an alert for autologous transplants.

8 RESULTS

8.1 IN ASTHMA

Asthma is an inflammatory disease, with no cure so far, that can cause severe limitations and irreversible damage to those affected. Regenerative medicine brings the expectation of tissue repair and regeneration, having important weight in the prognosis and longevity of the patient.

Eight horses with sEA were treated with a single intratracheal dose of bone marrow mononuclear cells (BMMC), presenting a decrease in respiratory effort and clinical score. The percentage of neutrophils decreased and that of macrophages increased in the BALF, as well as the levels of IL-10, when compared with the group treated with dexamethasone. The quantification of IL-4, IL-17, IFN- γ and IFN- α showed no alterations between the evaluations in both groups. These results suggest that the cell therapy adopted attenuated the inflammatory response of sEA (Barussi *et al.*, 2016).

The intrabronchial administration of adipose tissue-derived mesenchymal stromal stem cells (AT-MSC) significantly improved the clinical score, reduced the expression of IL-17 and the protein levels of IL-1 β , IL-4 and TNF α ($P = 0.02$) in asthmatic horses, having anti-inflammatory effects in the short term, and reduced the clinical signs of sEA after one year (Adamic *et al.*, 2022).

Recently, some horses received cellular products, derived from mesenchymal cell supernatants. This by-product was administered by the inhalation route, with the objective of evaluating both the therapeutic potential and the form of administration. The researchers concluded that the inhalation of the MSC supernatant presents itself as a potential therapeutic route for equine asthma, although efficacy trials are necessary, in addition to highlighting the potential of this approach in a possible management of human asthma (Colabufalo *et al.*, 2025).

Although the results are promising, further studies are necessary on the application of cells and derived products in airway diseases in horses, since it is a vast field and presents obstacles that need to be overcome until well-established therapies become consolidated.

8.2 ORTHOPAEDIC DISEASES

Cell therapy is more established in diseases of the musculoskeletal system, since it has been worked on for a longer time. It presents some advantages, especially regarding doses and forms of administration. While the dose of MSCs employed intra-articularly in osteoarticular injuries is around 10×10^6 cells (Bertoni *et al.* 2021; Joswig *et al.* 2017), the dose of MNCs applied intratracheally in horses with severe asthma was between 5 and 10×10^8 cells (Barussi *et al.*, 2019).

9 OVERALL OUTLOOK

There are still many variations of cells, cellular products and therapeutic applications, whether in quantity or quality, that may arise from the donor individual, type of sample or originating tissue, collection, processing and storage. There is also diversity regarding safety and quality control, especially when we compare the practices of human medicine and veterinary medicine. Shahid and collaborators (2025) emphasise the importance of the characterisation of the cells before administration, as well as the selection of those most adequate for the specific purpose.

Speaking specifically of equine medicine, in some procedures it is necessary to process or cultivate large volumes of biological material, considerably raising the final cost. One alternative is the use of products available on the market; however, it is important to

remember that they are not autologous. There are also some laboratories that offer the field veterinarian the processing, cultivation and storage of materials, which allows autologous therapy and can be a facilitator.

Among the important points regarding the choice of autologous or allogeneic cells are: the use of allogeneic MSCs includes a greater risk of immunological reactions and shorter cell survival time after injection, while the use of allogeneic ones includes the possibility of storage for long periods, allowing the treatment to be replicated, the collection of cells from young and healthy donors and the capacity to manipulate the stored cells before administration.

It is also fundamental that we understand the indications for use, doses and treatment times, since these conditions directly influence the results. Nevertheless, we had the opportunity to explore several examples that, even with a single use of cellular products and/or derivatives, resulted in important improvement of the condition/patient.

Regenerative medicine has a broad path to be travelled, but undoubtedly a promising one; however, it is necessary to exercise caution and continue seeking scientific foundation, so that the therapy is not prioritised to the detriment of the result.

Rogério Gabriel Nogalha de Lima¹

ABSTRACT

The growing adoption of Artificial Intelligence (AI) in the public sector has intensified challenges related to institutional coordination, risk management, and public value creation. Although the literature has advanced in the development of ethical principles, regulatory frameworks, and governance mechanisms, studies examining how public organisations develop institutional capabilities to govern AI in complex organisational environments remain limited. In this context, this article analyses how such capabilities are developed within Brazil's Ministry of Management and Innovation in Public Services (MGI). The research adopted a qualitative, exploratory, and descriptive approach, based on an instrumental single-case study and document analysis. The findings indicate that AI governance was not structured as an isolated mechanism of technological control but rather integrated into existing practices of digital governance, data governance, and information security. Four central dimensions associated with the development of institutional capability for AI governance were identified: institutional coordination, risk-based oversight, integration between governance and innovation, and continuous organisational adaptation. The results suggest that AI governance can be understood as an institutional capability emerging from the interaction between dynamic capabilities, federated governance, agile bureaucracy, and a public value-oriented approach. The study contributes to advancing the understanding of AI governance in the public sector by shifting the focus from a predominantly normative perspective towards an approach centred on the development of organisational capabilities.

Keywords: Artificial Intelligence. Artificial Intelligence Governance. Dynamic Capabilities. Federated Governance. Public Value.

RESUMO

A crescente adoção da Inteligência Artificial (IA) no setor público tem ampliado os desafios relacionados à coordenação institucional, gestão de riscos e geração de valor público. Embora a literatura avance na formulação de princípios éticos, modelos regulatórios e mecanismos de governança, permanecem limitados os estudos que investigam como organizações públicas desenvolvem capacidades institucionais para governar a IA em ambientes organizacionais complexos. Nesse contexto, este artigo analisa como tais capacidades são construídas no âmbito do Ministério da Gestão e da Inovação em Serviços

¹ Doctoral candidate in Public Administration. Instituto Brasileiro de Ensino, Desenvolvimento e Pesquisa (IDP). E-mail: rogerio.lima@aluno.idp.br

Públicos (MGI). A pesquisa adotou abordagem qualitativa, de natureza exploratória e descritiva, desenvolvida por meio de estudo de caso único instrumental e análise documental. Os resultados indicam que a governança de IA observada não foi estruturada como mecanismo isolado de controle tecnológico, mas integrada às práticas de governança digital, governança de dados e segurança da informação. Foram identificadas quatro dimensões centrais associadas à construção da capacidade institucional de governar IA: coordenação institucional, supervisão baseada em risco, integração entre governança e inovação e adaptação organizacional contínua. Os achados sugerem que a governança da IA pode ser compreendida como uma capacidade institucional resultante da interação entre capacidades dinâmicas, governança federada, burocracia ágil e orientação à geração de valor público. O estudo contribui para ampliar a compreensão da governança de IA no setor público ao deslocar o foco de uma perspectiva predominantemente normativa para uma abordagem centrada na construção de capacidades organizacionais.

1 INTRODUCTION

Artificial Intelligence (AI) has consolidated itself as one of the main technologies driving contemporary digital transformation. In recent years, governments around the world have begun to incorporate systems based on machine learning, natural language processing, and generative models into activities related to public service delivery, data analysis, process automation, and support for public policy formulation (WIRTZ *et al.*, 2020; MERGEL *et al.*, 2019). While expanding the state's capacity to innovate and produce public value, these technologies introduce challenges related to transparency, data protection, accountability, information security, and the management of risks associated with decisions supported by intelligent systems (ZUIDERWIJK *et al.*, 2021; OECD, 2024).

Recent investigations conducted by international bodies, such as the OECD (2024), UNESCO (2024), NIST (2023), and the World Bank (2024), indicate that the central axis of the challenges associated with Artificial Intelligence in the public sector has shifted from mere technological feasibility to institutional complexity. The emerging consensus suggests that the effectiveness of digital transformation increasingly depends on the capacity of public organisations to structure coordination, oversight, and adaptation mechanisms capable of ensuring the responsible use of AI, reconciling innovation, risk management, and the public interest.

Unlike traditional corporate technologies, whose adoption normally occurs through formal processes of planning, procurement, and governance (WEILL; ROSS, 2004), Generative Artificial Intelligence tools present reduced technical and operational barriers to access, enabling their direct use by end users and business areas without the need for specialised development or continuous intermediation by central information technology structures (OECD, 2024; NIST, 2023). The dissemination of generative AI has expanded the need for governance mechanisms capable of reconciling innovation, risk management, transparency, and human oversight, especially in complex organisational contexts (OECD, 2024). This characteristic increases the speed of technological experimentation and favours the emergence of decentralised initiatives, a phenomenon associated with the growth of so-called Shadow AI, in which AI-based solutions are adopted outside the formal mechanisms of organisational oversight (OECD, 2024; JANSSEN; VAN DER VOORT, 2020).

The complexity of this scenario is amplified in public organisations characterised by multiple administrative units, the sharing of technological resources, different levels of decision-making autonomy, and a high diversity of institutional demands. In these situations, excessively centralised mechanisms tend to reduce innovation capacity and generate decision-making bottlenecks, while excessively decentralised approaches may favour

technological fragmentation, duplication of investments, and the loss of strategic alignment (GALBRAITH, 1973; WEILL; ROSS, 2004). The challenge thus becomes one of constructing organisational arrangements capable of balancing autonomy and coordination, innovation and control, flexibility and accountability.

Although the literature on Artificial Intelligence Governance has advanced significantly in recent years, a large part of the research remains concentrated on ethical principles, regulatory aspects, and risk management mechanisms (WIRTZ *et al.*, 2020; ZUIDERWIJK *et al.*, 2021). Studies that empirically investigate how public organisations develop institutional capabilities able to transform these principles into effective practices of coordination, oversight, and organisational adaptation remain relatively scarce. This gap becomes particularly relevant in complex organisational environments, in which the adoption of AI depends on the articulation between multiple actors, governance structures, and distributed decision-making processes.

In view of this context, this article seeks to answer the following research question: which organisational mechanisms contribute to the construction of institutional capabilities able to govern Artificial Intelligence in public environments characterised by high organisational complexity?

To answer this question, the study aims to analyse how dynamic capabilities, federated governance mechanisms, and agile bureaucracy practices are articulated in the construction of the institutional capability to govern Artificial Intelligence in the public sector. Empirically, the investigation uses the experience of the Ministério da Gestão e da Inovação em Serviços Públicos (MGI) as an analytical lens to understand the organisational mechanisms that sustain the coordinated adoption of AI in a context marked by shared services, multiple organisational units, and different levels of decision-making autonomy.

The relevance of the study stems from the growing dissemination of Artificial Intelligence in public organisations and the limited understanding of the organisational mechanisms necessary for its governance. By empirically examining a context characterised by high institutional complexity, the article seeks to contribute to the advancement of the literature on digital governance and the transformation of the State, broadening the understanding of the processes of constructing institutional capabilities for AI governance.

The main theoretical contribution of the study consists of proposing an integrated interpretation of Artificial Intelligence governance in the public sector, understanding it as an institutional capability constructed through the interaction between dynamic capabilities (TEECE, 2007), federated governance (WEILL; ROSS, 2004), and agile bureaucracy mechanisms (MERGEL, 2016; JANSSEN; VAN DER VOORT, 2020). By shifting the

discussion from a predominantly normative perspective towards an approach centred on the construction of organisational capabilities, the study seeks to offer an analytical contribution to the understanding of AI governance in complex public organisations.

In addition to this introduction, the article is structured in six sections. The next section presents the theoretical framework underpinning the analysis. Subsequently, the methodological procedures adopted are described. The fourth section contextualises the case studied. The fifth presents the research results, followed by the discussion of the findings and the proposition of an interpretative model for Artificial Intelligence governance in the public sector. Finally, the conclusions, limitations, and opportunities for future research are presented.

2 THEORETICAL FRAMEWORK

2.1 ARTIFICIAL INTELLIGENCE GOVERNANCE IN THE PUBLIC SECTOR

There is relative consensus in the literature regarding the need for institutional mechanisms designed to ensure transparency, accountability, security, and the management of risks associated with Artificial Intelligence (OECD, 2024; UNESCO, 2024; NIST, 2023). There is also convergence regarding the importance of integrating technological, organisational, and regulatory aspects to enable the responsible adoption of these technologies, especially in public environments characterised by high institutional complexity and multiple decision-making actors (ZUIDERWIJK *et al.*, 2021; WIRTZ *et al.*, 2020).

However, understanding of how these principles are operationalised in complex public organisations remains limited. A large part of the literature concentrates on the formulation of ethical principles, normative guidelines, regulatory models, and conceptual governance frameworks, devoting less attention to the organisational mechanisms necessary to transform such recommendations into effective practices of coordination, oversight, and institutional adaptation (WIRTZ *et al.*, 2020; JANSSEN; VAN DER VOORT, 2020; OECD, 2024).

This gap becomes particularly relevant in view of the dissemination of Generative Artificial Intelligence. Unlike traditional corporate technologies, whose adoption normally occurs through formal processes of planning, procurement, and governance (WEILL; ROSS, 2004), generative tools present reduced technical and operational barriers to access, enabling their direct use by end users and business areas without the need for specialised development or continuous intermediation by central information technology structures (OECD, 2024; NIST, 2023). As a consequence, the need for governance mechanisms capable of reconciling innovation, risk management, transparency, and human oversight is expanded, especially in complex organisational contexts (OECD, 2024). This characteristic

increases the relevance of understanding how public organisations develop institutional capabilities to coordinate the adoption of AI without compromising the creation of public value, regulatory compliance, and the management of risks associated with the technology (MOORE, 1995; BRYSON *et al.*, 2014).

2.2 DIGITAL PUBLIC GOVERNANCE, PUBLIC VALUE, AND ARTIFICIAL INTELLIGENCE

Although the literature presents different perspectives for understanding the creation of public value, there is convergence regarding the need to articulate institutional outcomes, legitimacy, and operational capacity as central elements of public action (MOORE, 1995; BRYSON *et al.*, 2014; OSBORNE, 2021). In parallel, approaches such as the Public Service Logic and the Service-Dominant Logic reinforce the understanding that public value is constructed through the interaction between multiple actors, resources, and capabilities distributed across institutional ecosystems, in which users, organisations, and society jointly participate in value creation processes (VARGO; LUSCH, 2008; OSBORNE, 2021; ECHEVERRI; SKÅLÉN, 2021).

However, the way in which emerging technologies, particularly Artificial Intelligence, simultaneously alter the mechanisms of creation and destruction of public value remains relatively underexplored. Although the literature recognises the potential of AI to expand efficiency, analytical capacity, service quality, and government innovation, it also points to risks related to algorithmic biases, decision-making opacity, discrimination, digital exclusion, and the weakening of public trust (WIRTZ *et al.*, 2020; ZUIDERWIJK *et al.*, 2021; OECD, 2024). Despite these advances, studies that investigate how governance structures can act simultaneously in promoting the benefits and in mitigating the risks associated with the use of AI in the public sector are still limited.

This discussion suggests that the governance of Artificial Intelligence should be analysed not only from a technological or regulatory standpoint, but also as an institutional mechanism designed to enhance the creation and reduce the risks of destruction of public value arising from the inadequate use of these technologies. From this perspective, governance assumes a strategic role in aligning innovation, risk management, institutional legitimacy, and the generation of socially relevant outcomes, contributing to ensuring that the adoption of AI remains consistent with public objectives and democratic principles (MOORE, 1995; BRYSON *et al.*, 2014; OECD, 2024).

2.3 DYNAMIC CAPABILITIES AND THE CONSTRUCTION OF CAPABILITIES TO GOVERN ARTIFICIAL INTELLIGENCE

The literature on dynamic capabilities presents a high degree of consolidation in explaining the processes of organisational adaptation in the face of environments characterised by technological change, uncertainty, and the continuous need for innovation (TEECE; PISANO; SHUEN, 1997; TEECE, 2007; HELFAT *et al.*, 2007). Originally developed in the field of business strategy, this approach has been widely used to understand how organisations develop competences to respond to environmental transformations, reconfigure resources, and sustain their capacity for adaptation over time.

In particular, the dimensions of sensing, seizing, and transforming offer a robust framework for understanding how organisations identify opportunities and threats, mobilise resources, and promote structural changes in the face of new technological and institutional challenges (TEECE, 2007). These capabilities have been progressively incorporated into studies on digital transformation and innovation in the public sector, especially in contexts that demand organisational learning, inter-institutional coordination, and continuous adaptation (JANSSEN; VAN DER VOORT, 2020; MERGEL *et al.*, 2019).

Despite this advance, their application to the context of digital public governance and, more specifically, to the governance of Artificial Intelligence still remains under development. Although recent studies recognise that the adoption of AI requires new organisational capabilities related to risk management, institutional coordination, and technological oversight, investigations that analyse AI governance as a manifestation of the institutional capabilities of organisational adaptation remain limited (WIRTZ *et al.*, 2020; ZUIDERWIJK *et al.*, 2021).

Particularly scarce are studies that examine how public organisations develop permanent competences to identify technological opportunities, mobilise resources, reconfigure governance structures, and respond to the challenges arising from the rapid dissemination of Generative Artificial Intelligence. This gap becomes even more relevant in environments characterised by high institutional complexity, in which the governance of technology depends on the interaction between multiple actors, rules, resources, and coordination mechanisms.

From this perspective, dynamic capabilities offer a promising analytical lens for understanding the governance of Artificial Intelligence not only as a set of norms or control mechanisms, but as an institutional capability geared towards continuous organisational adaptation in the face of technological transformations (TEECE, 2007; HELFAT *et al.*, 2007).

2.4 FEDERATED GOVERNANCE AS AN ORGANISATIONAL CAPABILITY FOR ARTIFICIAL INTELLIGENCE GOVERNANCE

The literature recognises that exclusively centralised or decentralised models present limitations in dealing with complex organisational environments, characterised by high interdependence, a multiplicity of actors, and the need for continuous coordination (GALBRAITH, 1973; WEILL; ROSS, 2004). While excessively centralised structures tend to reduce the autonomy and responsiveness of organisational units, excessively decentralised models may amplify problems of fragmentation, duplication of efforts, and strategic misalignment (WILLIAMSON, 1985; WEILL; ROSS, 2004).

In response to these limitations, different studies have highlighted the importance of hybrid governance mechanisms capable of combining institutional coordination, operational autonomy, and strategic alignment. Such arrangements seek to balance control and flexibility, allowing different organisational units to preserve the capacity for local initiative without compromising the institutional coherence and strategic objectives of the organisation (WEILL; ROSS, 2004; JANSSEN; VAN DER VOORT, 2020).

However, investigations that analyse federated governance applied specifically to Artificial Intelligence in the public sector are still limited. Although the literature recognises the need for coordination mechanisms to deal with the risks, opportunities, and impacts of AI, studies focused on regulation, ethical principles, and normative frameworks predominate, devoting less attention to the organisational arrangements necessary to operationalise governance in complex environments (WIRTZ *et al.*, 2020; ZUIDERWIJK *et al.*, 2021; OECD, 2024).

This gap becomes particularly relevant in structures characterised by shared services, multiple bodies, different levels of digital maturity, and distributed decision-making autonomy. In these contexts, the governance of Artificial Intelligence depends on the institutional capacity to coordinate diverse interests, share resources, manage risks, and promote innovation simultaneously. Understanding how federated governance mechanisms contribute to balancing organisational autonomy, institutional oversight, and technological innovation therefore constitutes a theoretical and practical challenge still insufficiently explored by the literature.

From this perspective, federated governance can be understood not only as a structural arrangement for the distribution of responsibilities, but as an organisational capability geared towards the coordination of complex environments, offering a promising analytical lens for understanding the governance of Artificial Intelligence in the public sector (WEILL; ROSS, 2004; GALBRAITH, 1973).

2.5 AGILE BUREAUCRACY AND ADAPTIVE GOVERNANCE IN THE AGE OF ARTIFICIAL INTELLIGENCE

There is growing consensus that digital transformation requires more adaptive forms of public governance, capable of responding to the speed of technological changes without compromising fundamental principles of public administration, such as transparency, accountability, and institutional control (MERGEL, 2016; JANSSEN; VAN DER VOORT, 2020). In this context, agile bureaucracy emerges as an alternative for reconciling innovation and oversight, replacing excessively rigid mechanisms with more flexible approaches oriented towards continuous learning and organisational adaptation (MERGEL, 2016; MERGEL *et al.*, 2019).

This challenge becomes particularly relevant in the governance of Artificial Intelligence. The rapid evolution of intelligent systems, especially of applications based on Generative AI, frequently surpasses the responsiveness of traditional bureaucratic models, expanding the need for oversight mechanisms proportional to risk and capable of adapting to technological dynamics (OECD, 2024; NIST, 2023; UNESCO, 2024). Thus, the governance of AI requires organisational structures that reconcile innovation, risk management, and institutional compliance simultaneously.

Although the literature recognises the importance of adaptive governance in dealing with emerging technologies, studies that empirically analyse how principles associated with agile bureaucracy can be operationalised in the governance of Artificial Intelligence in complex public organisations are still limited (JANSSEN; VAN DER VOORT, 2020; WIRTZ *et al.*, 2020). How mechanisms of risk-based oversight, institutional coordination, and continuous adaptation contribute to the development of institutional capabilities capable of balancing technological innovation and public accountability remains particularly poorly understood.

2.6 THEORETICAL SYNTHESIS AND RESEARCH GAP

The review of the literature reveals a growing consensus that the governance of Artificial Intelligence should ensure that the technology is used in a safe, transparent, responsible manner and oriented towards the creation of public value (OECD, 2024; UNESCO, 2024; NIST, 2023). In parallel, different theoretical currents converge in recognising that the creation of public value depends on the articulation between institutional outcomes, legitimacy, and operational capacity, especially in environments characterised by multiple actors, shared resources, and high organisational interdependence (MOORE, 1995;

BRYSON *et al.*, 2014; OSBORNE, 2021). In this context, the dissemination of Generative Artificial Intelligence expands the need for governance mechanisms capable of balancing innovation, oversight, risk management, and accountability, particularly in complex public organisations.

The literature also recognises that organisational environments of this nature demand coordination structures capable of reconciling autonomy, strategic alignment, and institutional oversight (GALBRAITH, 1973; WEILL; ROSS, 2004). Likewise, there is growing recognition that continuous adaptation to technological transformations depends on the development of organisational capabilities geared towards the identification of opportunities, the mobilisation of resources, and the permanent reconfiguration of structures and processes (TEECE, 2007; HELFAT *et al.*, 2007). Complementarily, approaches associated with agile bureaucracy highlight the need for adaptive governance mechanisms capable of responding to the speed of technological changes without compromising the fundamental principles of public administration (MERGEL, 2016; JANSSEN; VAN DER VOORT, 2020).

Despite these advances, studies that empirically investigate how public organisations develop institutional capabilities to govern Artificial Intelligence in contexts characterised by high organisational complexity remain limited. In particular, there is a scarcity of research that integrates the perspectives of Artificial Intelligence Governance, Public Value, Dynamic Capabilities, Federated Governance, and Agile Bureaucracy into a single interpretative model. Accordingly, this study analyses the governance of Artificial Intelligence not only as a set of norms or control mechanisms, but as an institutional capability constructed through the interaction between organisational coordination, continuous adaptation, risk-based oversight, and orientation towards the creation of public value. From this perspective, the case of the Ministry is used as an empirical lens to understand how public organisations develop capabilities to govern Artificial Intelligence in environments characterised by high institutional complexity.

Figure 1

Analytical Model of the Research

Source: prepared by the author.

Thus, Figure 1 synthesises the analytical model adopted in this study. The model proposes that the construction of the institutional capability to govern Artificial Intelligence in

the public sector results from the interaction between AI governance mechanisms oriented towards the creation of public value, dynamic capabilities of organisational adaptation, and coordination structures represented by federated governance and agile bureaucracy. From this perspective, the research seeks to understand how these elements are articulated in organisational contexts characterised by high institutional complexity.

3 METHODOLOGY

3.1 RESEARCH DESIGN

This study adopts a qualitative approach, of an exploratory and descriptive nature, developed through an instrumental single-case study (Yin, 2018). The choice of this strategy is grounded in the need to understand how public organisations develop institutional capabilities to govern Artificial Intelligence in contexts characterised by high organisational complexity.

The case analysed corresponds to the MGI, selected here for its relevance to the digital transformation agenda of the Federal Public Administration and for the recent institutionalisation of formal mechanisms of Artificial Intelligence governance. More than understanding a specific experience, the study uses the case as an analytical lens to examine the organisational mechanisms involved in the construction of the institutional capability to govern emerging technologies.

As support for the preparation of the manuscript, generative Artificial Intelligence tools were used, including ChatGPT (OpenAI), Gemini, and NotebookLM (Google), exclusively for activities supporting academic writing, textual organisation, language revision, synthesis of content, and the preparation of conceptual graphical representations.

These tools were not employed for the collection, production, treatment, or analysis of the research data, nor for the interpretation of the results or the formulation of the conclusions. All decisions related to the research design, selection of sources, theoretical foundation, methodological procedures, analysis of findings, and preparation of the conclusions were conducted and validated by the authors, who assume full responsibility for the scientific content presented.

3.2 UNIT OF ANALYSIS AND SOURCES OF EVIDENCE

The unit of analysis corresponds to the Artificial Intelligence governance structure established within the MGI, comprising its normative mechanisms, organisational arrangements, coordination instruments, and oversight processes.

The research was based predominantly on document analysis. Normative, strategic, and operational documents related to the governance of Artificial Intelligence, digital governance, data governance, and risk management were examined. Among the main sources analysed, the following stand out: Portaria MGI nº 3.485/2026 (Brasil, 2026), the Resolutions of the Comitê de Governança Digital e Segurança da Informação (CGDSI), strategic Artificial Intelligence documents, technical reports (BRASIL, 2025a; BRASIL, 2025b; BRASIL, 2025c; BRASIL, 2026), and international normative references, including the ISO/IEC 23894, ISO/IEC 38507, and ISO/IEC 42001 standards (ABNT, 2022; ABNT, 2023; ABNT, 2024).

The use of multiple documentary sources sought to expand the robustness of the investigation through the triangulation of evidence and the traceability of the results.

3.3 ANALYSIS PROCEDURES

The documents were subjected to thematic analysis (BRAUN; CLARKE, 2006), a technique widely used in qualitative research for the identification, organisation, and interpretation of patterns of meaning present in the data.

The analysis was conducted in four stages. Initially, an exploratory reading of the documents was carried out, along with the identification of content related to the governance of Artificial Intelligence. Subsequently, the passages considered relevant were coded and grouped into thematic categories. In the third stage, the evidence was organised according to the central constructs of the theoretical framework: Artificial Intelligence Governance, Public Value, Dynamic Capabilities, Federated Governance, and Agile Bureaucracy. Finally, the results were interpreted in the light of these categories, seeking to understand how the observed mechanisms contribute to the construction of institutional capabilities for AI governance.

The analytical strategy adopted was predominantly deductive, since the categories used derive directly from the theoretical framework guiding the research.

3.4 ETHICAL CONSIDERATIONS AND RESEARCH QUALITY

The research used exclusively institutional, normative, and technical documents, not involving the collection of personal data or the direct participation of individuals. Thus, there was no treatment of sensitive information or identification of participants.

To strengthen the reliability of the results, documentary triangulation, the use of multiple sources of evidence, and the alignment between the analytical categories and the theoretical constructs of the research were adopted. Additionally, the description of the

methodological procedures seeks to ensure transparency and to allow the replication of the analytical strategy adopted.

3.5 RESEARCH LIMITATIONS

As with any single-case study, the results should be interpreted considering the specificities of the institutional context analysed. The objective of the research is not to produce statistical generalisations, but to generate analytical contributions that can be transferred to similar organisational contexts.

Furthermore, the investigation is based predominantly on document analysis. Although this strategy provides high traceability of the evidence analysed, future studies may complement the results through interviews with managers, specialists, and users involved in the implementation of Artificial Intelligence initiatives.

Figure 2*Research Methodology*

Source: prepared by the author.

Figure 2 synthesises the methodological path adopted in the research. The methodological design combined an instrumental single-case study, document analysis, and triangulation of evidence, enabling examination of the construction of institutional capabilities for the governance of Artificial Intelligence in the context of the Ministry. The strategy adopted sought to ensure coherence between the theoretical framework, the sources of evidence, and the analytical procedures employed in the interpretation of the results.

Finally, considering that AI governance constitutes a constantly evolving phenomenon, the results reflect a specific stage of institutional maturity, subject to transformations arising

from technological advances, regulatory changes, and the evolution of organisational practices.

4 ORGANISATIONAL CONTEXT AND CHALLENGES OF ARTIFICIAL INTELLIGENCE GOVERNANCE

The adoption of Artificial Intelligence (AI) in the public sector occurs in a context marked by the expansion of digital transformation initiatives, by the increase in organisational complexity, and by the need for coordination between multiple institutional actors (MERGEL *et al.*, 2019; JANSSEN; VAN DER VOORT, 2020). Unlike technologies traditionally implemented by central information technology areas, AI-based solutions, especially generative tools, tend to be incorporated directly by business areas, expanding the speed of innovation and the challenges associated with institutional oversight (OECD, 2024; NIST, 2023).

In this scenario, the Ministry constitutes a particularly relevant context for analysis. In addition to playing a strategic role in the digital transformation agenda of the Federal Public Administration, the Ministry is embedded in an environment characterised by the sharing of technological resources, a multiplicity of organisational actors, and high institutional interdependence. Such characteristics are frequently associated with contexts of high organisational complexity, in which coordination between different units becomes a critical element for governance and for the creation of public value (GALBRAITH, 1973; BRYSON *et al.*, 2014).

This complexity was amplified by the creation of ColaboraGov, established by Decreto nº 11.837, de 2023 (BRASIL, 2023), which set up the first Shared Services Centre of the Federal Public Administration. The model brings together different ministries and bodies in a structure geared towards the sharing of administrative and technological services, covering areas such as human resources management, budget, finance, accounting, and information technology.

From the perspective of technological governance, the model presents characteristics that significantly amplify the challenges of institutional coordination. The coexistence of multiple bodies served, different levels of digital maturity, a diversity of systems, shared contracts, and distinct organisational priorities produces an environment in which decisions related to Artificial Intelligence depend on the capacity to balance organisational autonomy and strategic alignment. This condition is frequently observed in federated governance models, in which different units retain the capacity for local initiative but operate under

common mechanisms of coordination and oversight (WEILL; ROSS, 2004; WILLIAMSON, 1985).

The dissemination of Generative Artificial Intelligence tools further intensified this challenge. The reduction of barriers to access to the technology expanded the experimentation capacity of organisational areas, but also increased the risks associated with the inadequate use of institutional data, technological fragmentation, and the development of initiatives outside the formal mechanisms of oversight (OECD, 2024; UNESCO, 2024). This phenomenon has reinforced the need for organisational structures capable of combining technological innovation, risk management, and institutional oversight on a continuous basis (NIST, 2023).

In this context, the governance of Artificial Intelligence ceases to represent merely a technological challenge and comes to constitute an organisational challenge. The capacity to innovate becomes directly dependent on the institutional capacity to coordinate different interests, oversee risks, promote strategic alignment, and ensure that the use of the technology remains compatible with the principles of public administration and with organisational objectives (JANSSEN; VAN DER VOORT, 2020; OECD, 2024).

In response to this scenario, the MGI began the construction of a specific Artificial Intelligence governance structure integrated into the already existing practices of digital governance, data governance, and information security. Among the main institutional milestones, the following stand out: the publication of Portaria MGI nº 3.485, de 2026 (BRASIL, 2026), the work of the Comitê de Governança Digital e Segurança da Informação (CGDSI), the creation of the Subcomitê de Inteligência Artificial (SCIA), and the integration of AI governance into the Ministry's Data Governance Policy (BRASIL, 2025a; BRASIL, 2025b; BRASIL, 2025c; BRASIL, 2026).

This approach converges with international recommendations that advocate the incorporation of AI governance into the already consolidated institutional mechanisms of management, risk, and compliance, avoiding parallel structures and promoting greater integration between technology, governance, and organisational strategy (ABNT, 2022; ABNT, 2024; OECD, 2024).

The analysis of the institutional documents indicates that the adopted model does not fit into a strictly centralised nor a fully decentralised logic. The existence of central mechanisms responsible for the definition of guidelines, risk criteria, minimum compliance requirements, and institutional oversight is observed, coexisting with the autonomy of organisational units to identify opportunities, propose initiatives, and develop solutions adhering to their specific needs.

This configuration approximates the concept of federated governance described by Weill and Ross (2004), in which strategic coordination and operational autonomy coexist as complementary governance mechanisms. More than distributing responsibilities, the model seeks to create institutional conditions for technological innovation to occur in a manner compatible with the requirements of information security, data governance, regulatory compliance, and the creation of public value.

Thus, the case analysed presents characteristics particularly relevant to the investigation proposed in this study. The combination of shared services, multiple bodies, different levels of autonomy, and the growing adoption of Artificial Intelligence configures an environment of high organisational complexity, suitable for examining how public organisations develop institutional capabilities to govern emerging technologies. From this perspective, the case allows for the empirical analysis of the interaction between dynamic capabilities (TEECE, 2007; HELFAT *et al.*, 2007), federated governance (WEILL; ROSS, 2004), and agile bureaucracy (MERGEL, 2016; JANSSEN; VAN DER VOORT, 2020), elements that constitute the analytical core of this research.

The characterisation of this context does not have a merely descriptive purpose. Its aim is to highlight the institutional conditions that justify the adoption of mechanisms of federated governance, agile bureaucracy, and the development of institutional capabilities for the governance of Artificial Intelligence, constituting the empirical basis for the analysis of the results presented in the following section.

5 RESULTS AND DISCUSSION

The document analysis allowed the identification that the Artificial Intelligence governance developed within the MGI was not structured as an isolated initiative, but incorporated into the already existing mechanisms of digital governance, data governance, and information security. The documents analysed reveal the creation of formal coordination bodies, risk-based oversight mechanisms, instruments to support innovation, and continuous processes of institutional adaptation (BRASIL, 2025a; BRASIL 2025b; BRASIL, 2026).

From the analysis carried out, four central dimensions (Table 1) associated with the construction of the institutional capability to govern Artificial Intelligence were identified: (i) institutional coordination; (ii) risk-based oversight; (iii) integration between governance and innovation; and (iv) continuous organisational adaptation.

Table 1*Synthesis of the main findings*

Identified Dimension	Observed Evidence	Associated Framework
Institutional Coordination	CGDSI, SCIA, and integration between digital governance, data, and security	Federated Governance
Risk-Based Oversight	Classification of initiatives and differentiated levels of oversight	Agile Bureaucracy
Integration between Governance and Innovation	Guidance, training, and controlled experimentation	Public Value
Continuous Organisational Adaptation	Inventory, monitoring, and normative updating	Dynamic Capabilities

Source: prepared by the author.

5.1 INSTITUTIONAL COORDINATION AND FEDERATED GOVERNANCE

The documents analysed reveal the work of the Comitê de Governança Digital e Segurança da Informação (CGDSI) as a strategic body responsible for the definition of institutional guidelines related to Artificial Intelligence, as well as that of the Subcomitê de Inteligência Artificial (SCIA) as a technical advisory structure responsible for the evaluation and monitoring of the proposed initiatives (BRASIL, 2026).

The integrated participation of the data governance, information security, and information technology structures in the evaluation processes of AI initiatives was also observed. This integration demonstrates that the governance of the technology was conceived in a transversal manner, involving different organisational competences and reducing decision-making fragmentation.

The findings indicate that the adopted model combines central coordination mechanisms with the autonomy of organisational units to identify opportunities and propose specific applications of Artificial Intelligence. This configuration approximates the concept of federated governance, characterised by the coexistence of strategic coordination and operational autonomy (WEILL; ROSS, 2004).

Unlike exclusively centralised or decentralised models, the observed structure seeks to balance institutional alignment, risk management, and local innovation capacity. This result reinforces the argument that complex organisational environments demand hybrid coordination mechanisms capable of reconciling autonomy and institutional integration (GALBRAITH, 1973; WILLIAMSON, 1985).

5.2 RISK-BASED OVERSIGHT AND AGILE BUREAUCRACY

The second dimension identified refers to the adoption of oversight mechanisms proportional to the risk associated with Artificial Intelligence initiatives.

The documents analysed reveal the existence of formal procedures for the classification of initiatives according to criteria related to data treatment, the criticality of the processes involved, potential impacts, and the level of autonomy of the proposed solutions (BRASIL, 2026). Based on this classification, different levels of evaluation and institutional monitoring are established.

It was observed that the intensity of oversight varies according to the risks identified, moving away from a uniform logic of control applicable indistinctly to all initiatives. Instead, the structure analysed adopts graduated governance mechanisms, compatible with the nature and potential impacts of each application.

This result adheres to the concept of agile bureaucracy, which proposes adaptive governance mechanisms capable of combining institutional control and operational flexibility (MERGEL, 2016). Likewise, it converges with the perspective of Janssen and Van der Voort (2020), according to which digital transformation requires more dynamic forms of oversight proportional to risk.

5.3 INTEGRATION BETWEEN GOVERNANCE AND INNOVATION

The third dimension observed refers to the integration between governance mechanisms and the promotion of innovation.

The institutional documents analysed indicate that the governance of Artificial Intelligence was conceived not only as an instrument of oversight, but also as a mechanism to stimulate the responsible use of the technology. Actions related to the guidance of demanding areas, user training, the dissemination of good practices, and the encouragement of the development of initiatives aligned with institutional guidelines were identified (BRASIL, 2026).

The results suggest that the structure analysed seeks to reduce organisational barriers to innovation without eliminating the necessary mechanisms of control and compliance. In this sense, governance comes to exercise simultaneously functions of oversight and inducement of innovation.

This finding converges with the recommendations of the OECD (2024) and UNESCO (2024), which advocate the construction of governance models capable of balancing technological innovation and risk management. It also approximates the conception of public value proposed by Moore (1995) and expanded by Bryson *et al.* (2014), in demonstrating that

governance can contribute simultaneously to institutional legitimacy, organisational efficiency, and the generation of socially relevant benefits.

5.4 DYNAMIC CAPABILITIES AND THE CONSTRUCTION OF THE INSTITUTIONAL CAPABILITY TO GOVERN AI

The fourth dimension identified refers to continuous organisational adaptation in the face of technological evolution.

The documents analysed reveal mechanisms geared towards the permanent monitoring of Artificial Intelligence initiatives, the updating of institutional guidelines, the revision of governance instruments, and the incorporation of new national and international normative references (BRASIL, 2026). Initiatives related to the training of civil servants, the inventory of AI solutions, and the continuous monitoring of the risks associated with the technology were also identified.

These elements indicate that the observed structure was conceived as a dynamic governance mechanism, subject to continuous improvements in response to technological, regulatory, and organisational changes.

From the perspective of dynamic capabilities, the results reveal the presence of the three dimensions proposed by Teece (2007). The identification of opportunities and risks associated with Artificial Intelligence approximates the sensing capability. The mobilisation of resources, governance structures, and coordination mechanisms relates to the seizing capability. Finally, the continuous updating of institutional practices reflects the transforming capability (TEECE, 2007; HELFAT *et al.*, 2007).

Taken together, the findings suggest that the governance observed in the case studied transcends the simple creation of norms or control structures. The results indicate the construction of permanent institutional capabilities geared towards coordination, oversight, innovation, and organisational adaptation. This institutional capability constitutes the main result observed and represents the main contribution of the study to the understanding of Artificial Intelligence governance in the public sector.

Figure 3*Interpretative Model of the Results*

Source: prepared by the author.

As illustrated in Figure 3, the four dimensions identified do not act in isolation. On the contrary, they constitute a dynamic governance system in which coordination, oversight, innovation, and organisational adaptation mutually reinforce one another. This interaction contributes to the formation of permanent institutional capabilities capable of sustaining the responsible adoption of Artificial Intelligence in complex organisational environments.

The results reinforce the central proposition of this study: the governance of Artificial Intelligence should not be understood only as a set of rules or compliance mechanisms, but as an institutional capability constructed through the interaction between federated governance, agile bureaucracy, dynamic capabilities, and orientation towards the creation of public value.

In the case analysed, this capability manifests itself through mechanisms of institutional coordination, risk-based oversight, integration between governance and innovation, and continuous organisational adaptation, which allow the reconciliation of organisational autonomy, risk management, and technological innovation in an environment characterised by high institutional complexity. Taken together, these dimensions contribute to the formation of permanent governance structures capable of sustaining the responsible adoption of Artificial Intelligence, expanding the state's capacity to generate public value without compromising the requirements of transparency, security, accountability, and

regulatory compliance. Figure 2 synthesises the interpretative model emerging from the research and the relationships identified between these dimensions.

6 CONCLUSION

This study aimed to analyse how public organisations develop institutional capabilities to govern Artificial Intelligence in contexts characterised by high organisational complexity. To this end, a qualitative case study was carried out within the MGI, using document analysis of normative provisions, governance instruments, and institutional documents related to the adoption and oversight of Artificial Intelligence.

The results indicate that the AI governance observed in the case studied was not constructed as an isolated mechanism of technological control. On the contrary, the incorporation of Artificial Intelligence into the already existing structures of digital governance, data governance, and information security was verified, resulting in the creation of integrated mechanisms of institutional coordination, risk-based oversight, the stimulation of responsible innovation, and continuous organisational adaptation.

The analysis allowed the identification of four central dimensions associated with the construction of the institutional capability to govern Artificial Intelligence: institutional coordination, risk-based oversight, integration between governance and innovation, and continuous organisational adaptation. Taken together, these dimensions reveal that AI governance transcends the simple elaboration of norms or formal control structures, constituting an organisational capability geared towards the coordination of technological innovation in complex and highly interdependent environments.

From a theoretical point of view, the study contributes to the literature by integrating perspectives traditionally analysed in isolation. The results suggest that the institutional capability to govern Artificial Intelligence can be understood as a result of the interaction between dynamic capabilities, federated governance mechanisms, agile bureaucracy practices, and orientation towards the creation of public value. This interpretation broadens the understanding of AI governance in the public sector by shifting the focus from a predominantly normative perspective towards an approach centred on the construction of organisational capabilities.

In practical terms, the findings offer subsidies for public organisations seeking to structure mechanisms of Artificial Intelligence governance without compromising innovation and organisational autonomy. The results indicate that models based exclusively on centralisation or decentralisation tend to present limitations in the face of the growing institutional complexity associated with digital transformation. In this context, federated

governance arrangements, combined with proportional oversight mechanisms, prove to be promising alternatives for balancing innovation, risk management, and strategic alignment.

As limitations, the study concentrated on a single organisational case and used predominantly documentary sources. Although this strategy allowed high traceability of the evidence analysed, the results should be interpreted considering the specificities of the institutional context investigated. Furthermore, the rapid evolution of Artificial Intelligence technologies suggests that governance structures and organisational mechanisms may undergo significant transformations over time.

Finally, future research may broaden the understanding of the phenomenon through comparative studies between different public bodies, investigations involving multiple organisational cases, and approaches that incorporate interviews with managers, specialists, and users. It also proves relevant to deepen the analysis of the relationships between federated governance, dynamic capabilities, and the creation of public value in contexts of growing adoption of Artificial Intelligence in the public sector.

It is concluded that governing Artificial Intelligence in the public sector consists not only of establishing rules, controls, or compliance requirements. It is, above all, a matter of developing institutional capabilities able to coordinate innovation, oversight, and organisational adaptation on a continuous basis, ensuring that the benefits of the technology remain aligned with the creation of public value.

ABSTRACT

The literature on rural extension has demonstrated the limits of diffusionist and prescriptive models, particularly in the face of the growing recognition of participation, agroecology and territorial development. Nevertheless, the question of how territories participate in the very definition of the problems that orient extension action remains insufficiently explored. Departing from this gap, the article proposes the concept of territorial listening as an epistemological category of contemporary rural extension. Methodologically, a qualitative approach of a theoretical-analytical nature is developed, grounded in a critical review of the literature on rural extension, territoriality, the ecology of knowledges, social interfaces and socio-technical innovation. It is argued that the persistence of diffusionist traits in Technical Assistance and Rural Extension does not derive solely from the continuity of technology transfer mechanisms, but from the reproduction of institutional arrangements in which the definition of problems, priorities and responses remains concentrated outside the rural territories. In contrast, it is argued that territorial listening constitutes a systematic process of recognition, interpretation and problematisation of the rationalities, temporalities, conflicts, needs, expectations and knowledges that structure social life in the used territory. The analysis sustains that the principal weakness of many extension projects does not lie in the absence of technologies or resources, but in the insufficiency of institutional mechanisms capable of incorporating territories into the definition of the public problems that orient intervention. It is concluded that territorial listening operates as a mechanism for the redistribution of cognitive authority over the formulation of priorities, agendas and solutions, contributing to more legitimate processes of socio-technical innovation and rural development.

como categoria epistemológica da extensão rural contemporânea. Metodologicamente, desenvolve-se uma abordagem qualitativa, de natureza teórico-analítica, fundamentada em revisão crítica da literatura sobre extensão rural, territorialidade, ecologia dos saberes, interfaces sociais e inovação sociotécnica. Sustenta-se que a permanência de traços difusionistas na Assistência Técnica e Extensão Rural não decorre apenas da continuidade de mecanismos de transferência tecnológica, mas da reprodução de arranjos institucionais nos quais a definição dos problemas, das prioridades e das respostas permanece concentrada fora dos territórios rurais. Em contraposição, argumenta-se que a escuta territorial constitui um processo sistemático de reconhecimento, interpretação e problematização das racionalidades, temporalidades, conflitos, necessidades, expectativas e saberes que estruturam a vida social no território usado. A análise permite sustentar que a principal fragilidade de muitos projetos extensionistas não reside na ausência de tecnologias ou recursos, mas na insuficiência de mecanismos institucionais capazes de incorporar os territórios à definição dos problemas públicos que orientam a intervenção. Conclui-se que a escuta territorial opera como mecanismo de redistribuição da autoridade cognitiva sobre a formulação de prioridades, agendas e soluções, contribuindo para processos mais legítimos de inovação sociotécnica e desenvolvimento rural.

RESUMEN

La literatura sobre extensión rural ha demostrado los límites de los modelos difusionistas y prescriptivos, especialmente ante la creciente valorización de la participación, la agroecología y el desarrollo territorial. Sin embargo, permanece insuficientemente explorada la cuestión de cómo los territorios participan en la definición de los propios problemas que orientan la acción extensionista. Partiendo de esta laguna, el artículo propone el concepto de escucha territorial como categoría epistemológica de la extensión rural contemporánea. Metodológicamente, se desarrolla un enfoque cualitativo, de naturaleza teórico-analítica, fundamentado en una revisión crítica de la literatura sobre extensión rural, territorialidad, ecología de los saberes, interfaces sociales e innovación sociotécnica. Se sostiene que la permanencia de rasgos difusionistas en la Asistencia Técnica y Extensión Rural no deriva únicamente de la continuidad de mecanismos de transferencia tecnológica, sino de la reproducción de arreglos institucionales en los cuales la definición de los problemas, de las prioridades y de las respuestas permanece concentrada fuera de los territorios rurales. En contraposición, se argumenta que la escucha territorial constituye un proceso sistemático de reconocimiento, interpretación y problematización de las racionalidades, temporalidades, conflictos, necesidades, expectativas y saberes que estructuran la vida social en el territorio usado. El análisis permite sostener que la principal fragilidad de muchos proyectos extensionistas no reside en la ausencia de tecnologías o recursos, sino en la insuficiencia de mecanismos institucionales capaces de incorporar los territorios a la definición de los problemas públicos que orientan la intervención. Se concluye que la escucha territorial opera como mecanismo de redistribución de la autoridad cognitiva sobre la formulación de prioridades, agendas y soluciones, contribuyendo a procesos más legítimos de innovación sociotécnica y desarrollo rural.

1 INTRODUCTION

The critique of prescriptive rural extension already possesses a consolidated trajectory, since, ever since the contestation of agricultural modernisation and technological diffusion, a field of reflection has been formed that questions the pretension of universalising technical packages, institutional languages and external criteria of efficiency as though they were naturally adequate responses to rural realities (Caporal, 1998; Thiollent, 1984; Stroparo, 2025a).

Despite this critical accumulation, central traits of this pattern remain present in extension practices, including in contexts in which the institutional lexicon has come to value participation, agroecology, sustainability and territorial development (Diniz; Hespanhol, 2019; Grígolo *et al.*, 2015; Zarnott *et al.*, 2017).

This inflection also finds support in the conception of university extension consolidated by the Fórum de Pró-Reitores de Extensão das Instituições Públicas de Educação Superior Brasileiras (FORPROEX), which defines it as an interdisciplinary, educational, cultural, scientific and political process capable of promoting transformative interaction between university and society (FORPROEX, 2012). Although formulated within the scope of university extension, this perspective contributes to questioning unidirectional models of intervention and reinforces the need to understand the production of knowledge as a relational, dialogical and socially situated process.

This mismatch suggests that the problem of contemporary extension is not limited to the inadequacy of instruments or methodologies. Its most persistent core lies in the way problems, priorities and solutions continue to be defined from institutional centres external to the territories, relegating farmers and rural collectives to the condition of recipients, informants or beneficiaries of previously formulated agendas (Deponti; Almeida, 2012; Samborski *et al.*, 2017).

In this sense, the persistence of diffusionism should be read less as the survival of outdated techniques and more as the reproduction of a grammar of power over knowledge.

The current literature has produced important advances by emphasising participation, dialogue, shared construction of knowledge and the valorisation of local knowledges. Nevertheless, these approaches do not always explicitly confront a prior question: who participates in the definition of the very problems that orient intervention?

In many cases, farmers and communities are invited to collaborate in the implementation, adaptation or validation of solutions, but not necessarily in the formulation of the agendas that structure extension action. At times, they are subjected to imposing protocols that deterritorialise the community's knowledges and alter processes.

This gap suggests the need for an analytical category capable of understanding how territories interfere in the constitution of the public problems that mobilise rural extension; and it is precisely at this point that the concept of territorial listening acquires analytical relevance, since to listen to the territory does not merely mean to gather local data, apply rapid diagnoses or collect declared preferences, but to recognise the territory as a web of social relations, uses, conflicts, scales of power, temporalities and situated knowledges, from which problems and solutions must be constructed (Santos, 2002; Schneider; Tartaruga, 2004, 2005).

More than a technique of approximation, territorial listening is conceived here as a condition of possibility for a post-diffusionist extension: it reorganises the relationship between knowledge and intervention, because it displaces the legitimate definition of the problem from the institutional centre to the territorial interfaces where actors, norms, experiences and socio-technical objects enter into relation (Deponti; Almeida, 2012; Jasanoff, 2004; Samborski *et al.*, 2017).

The argument of the article is organised around four theses: a) that territorial listening constitutes a critique of diagnostic exteriority, because it requires submitting the institutional questions themselves to the test of territorial rationalities (Deponti; Almeida, 2012; Thiollent, 1984); b) the thesis that it operates as a relational theory of the territory, refusing the reading of rural space as a mere receptacle of demands and taking it as a historical configuration of powers, belongings, uses and conflicts (Raffestin, 1987; Santos, 2002; Schneider; Tartaruga, 2004); c) territorial listening as a principle of epistemic justice, since the legitimate definition of problems depends on the co-presence, confrontation and translation between heterogeneous knowledges (Santos *et al.*, 2006; Sousa, 2015; Torres-Rego, 2022); and d) as a socio-technical condition of innovation, since durable solutions tend to arise from processes of co-production anchored in the territory (Cotrim, 2017; Jasanoff, 2004; Rist, 2009).

The contribution of the text, therefore, consists in consolidating territorial listening as an epistemological category of contemporary rural extension, whose methodological and political ramifications are discussed throughout the article.

Rather than treating it as an auxiliary technique of participation, it is argued that territorial listening simultaneously redefines what counts as a problem, who may legitimately name it and under what conditions a solution may be considered pertinent. The objective, therefore, is to analyse the limits of prescriptive extension models and to discuss territorial listening as the foundation of processes of territorially contextualised socio-technical innovation.

The argument develops in six movements: the diffusionist heritage of extension; the relationship between knowledge, power and the definition of problems; the articulation between territorial listening and territoriality; the passage from transfer to co-production; the redefinition of the role of the extension agent; and, finally, the formulation of a new extension paradigm.

2 METHODOLOGY

The article is characterised as a theoretical-analytical study of a qualitative nature, based on interpretative bibliographical review and conceptual reconstruction (Guerra *et al.*, 2024). Its purpose is not to measure the empirical incidence of specific extension practices, but to critically examine a tradition of debate and, on that basis, to propose the concept of territorial listening as an analytical category of contemporary rural extension.

The bibliographical corpus was composed of classical and contemporary authors pertinent to six articulated axes: critique of diffusionism and prescriptive extension; agroecology and the social construction of knowledge; knowledge, power and the definition of problems; territory and territoriality; actor-oriented approach and rural development; and socio-technical innovation and co-production. The selection privileged the Brazilian and Latin American debate on rural extension and territorial development, without excluding international contributions indispensable to the conceptual formulation of the problem. In this composition, institutional landmarks such as PNATER and ANATER were mobilised not as a central autonomous object, but as historical and normative evidence of the tensions between participatory orientation and diffusionist persistence.

From the analytical point of view, the procedure adopted consisted of three complementary movements. The first was reconstructive, aimed at identifying the theoretical and political limits of the prescriptive paradigm of extension. The second was relational, seeking to articulate the contributions of authors of the territory, the ecology of knowledges, communicative action, social interfaces and socio-technical co-production. The third was propositional, oriented towards the systematisation of territorial listening as a concept endowed with epistemological, methodological and political reach.

Thus, the methodology does not operate as a stage external to the argumentation, but as a form of reflexive organisation of the article's own theoretical trajectory.

3 RESULTS AND DISCUSSION

3.1 THE PERSISTENCE OF THE PRESCRIPTIVE PARADIGM IN RURAL EXTENSION

The diffusionist tradition structured much of the extension institutionality by treating innovation as a linear sequence: research generates solutions, extension transmits them and farmers adopt them at distinct rhythms (Rogers, 2003; Rist, 2009).

In this context, knowledge appears as a finished product, separated from its contexts of use, and farmers enter the process above all as recipients of change. Thiollent's classical critique shows that this model is not only technically limited, but ideologically oriented (Thiollent, 1984). By taking modernisation as an indisputable horizon, technological diffusion converts communication into persuasion, individualises the success or failure of adoption and obscures the social, cultural and ecological conditions that shape agricultural practices. The problem, therefore, lies not only in the vertical transmission of technique, but in the presupposition that the relevant responses are already defined before the encounter with social reality.

In the Brazilian literature, this legacy remains a central negative reference for the critical revision of ATER (Technical Assistance and Rural Extension), where, for example, Caporal argues that conventional extension, supported on the diffusion of innovations, is insufficient to respond to the challenges of sustainable development, precisely because it separates technology, context and social participation (Caporal, 1998).

From a similar perspective, Long (2001) argues that rural interventions do not bear upon passive contexts, but upon arenas composed of actors who continually interpret, negotiate and reconfigure external proposals. On the other hand, the heterogeneity of modes of production and of strategies of social reproduction in the countryside renders particularly problematic the presumption of universally valid solutions for distinct rural contexts (Ploeg, 2008).

Later, the institutional inflection represented by PNATER sought to break with this pattern by incorporating agroecology, participation and social diversity as guiding principles (Diniz; Hespanhol, 2019). However, the normative reorientation did not eliminate the persistence of hierarchical routines, bureaucratic overload, decision-making centralisation and the instrumental use of extension agents as executors of programmes (Diniz e Hespanhol, 2019).

The persistence of diffusionist elements also appears when the territorial language is incorporated merely by addition. Grígolo *et al.* (2015) show that the reference to the territory does not always produce substantive change, since it frequently confines itself to expanding the institutional vocabulary without altering capacities, routines and forms of coordination.

The territory comes to figure as a new administrative scale, not as a principle of reorganisation of intervention. Zarnott *et al.* (2017), for example, identify a similar process when analysing the tension between the critical orientation of PNATER and the recomposition of a more technocratic agenda around ANATER.

The persistence of diffusionism, therefore, does not derive from simple doctrinal lag, but expresses the resilience of a form of power that stabilises the institutional priority of supply over listening, of solution over problem and of prescription over mediation. It is this structure that needs to be denaturalised so that the territories themselves may participate in the definition of the problems, priorities and solutions that orient extension action.

If the persistence of the prescriptive paradigm does not derive solely from the maintenance of diffusion techniques, but from the reproduction of institutionalised forms of problem definition, then the central question of rural extension shifts from the choice of solutions to the processes by which certain demands acquire public legitimacy.

3.2 KNOWLEDGE, POWER AND THE DEFINITION OF PROBLEMS

The critique of prescriptive extension becomes more rigorous when it displaces the focus from technologies to the politics of problem definition, since before asking which techniques should be promoted, one must question who names the deficiency, who hierarchises priorities and in what language a problem becomes recognisable to the institutional apparatus. At this point, extension reveals itself as a practice of power over knowledge.

The analysis of social interfaces formulated by Deonti and Almeida (2012) is especially fruitful for this displacement. It is understood that public intervention does not operate as the simple linear execution of a project, but as an arena in which distinct lifeworlds meet, negotiate, silence, resist and translate expectations.

In this sense, the extension agent does not deal with a homogeneous public, but with actors who possess their own resources, margins of manoeuvre and selective forms of adherence. Refusal itself, silence or low participation may constitute active responses to external agendas (Deonti; Almeida, 2012).

This implies recognising that the definition of the problem is not neutral, since prescriptive models tend to convert diagnosis into a stage of legitimising already known responses, where data collection thus occurs to confirm the pertinence of projects formulated before the real interaction with the territory. In contrast, dialogical approaches sustain that the situation of action must be constructed intersubjectively, with the application of the theory of communicative action (Feenberg, 1996; Habermas, 1984). Therefore, the legitimacy of

intervention depends on the negotiation of common definitions, and never on the imposition of technical criteria and/or the beliefs of researchers (Samborski *et al.*, 2017).

When the farmer is treated as the object of educational action, the extension practice reproduces a logic of cultural invasion. Problematisation, on the contrary, requires that the programmatic content arise from the concrete relationship of the subjects with their world and that the project make sense for those who will participate in it (Torres-Rego, 2022).

The same inflection appears in the so-called pedagogy of inquiry, in which listening, knowing practices and problematising compose a methodological sequence oriented by immersion in reality, and not by the advance transmission of responses (Marinho *et al.*, 2022).

Dealing specifically with the literature on the construction of agroecological knowledge, one verifies the discourse that scientific knowledges and local knowledges should not merely be juxtaposed, but articulated around questions that are effectively relevant to the context (Sousa, 2015).

From this perspective, the problem does not pre-exist as an objective datum available for more qualified technicians to identify it but, on the contrary, is socially constructed in processes of interpretation, conflict and translation. For this reason, the inequality between knowledges is not a methodological detail, but a central component of the power relation that structures extension action.

The notion of territorial listening arises precisely in this context, since it is not merely a matter of the actors' opinion on possible solutions, but of the prior process by which needs, urgencies and horizons of action are named, disputed and stabilised.

To listen, therefore, is to admit that the problem is not yet entirely given and that its adequate formulation depends on the encounter between different regimes of knowledge. For this reason, territorial listening does not begin with the community response to an institutional question, but with the critical suspension of the question itself, that is, with the disposition to submit the initial technical framing to the test of territorial rationalities (Deponti; Almeida, 2012; Marinho *et al.*, 2022; Thiollent, 1984).

Therefore, by displacing attention from solutions to the processes of problem definition, territorial listening introduces an additional question: where are the rationalities formed that orient collective needs, priorities and expectations? Answering this question requires understanding the territory not only as a space of intervention, but as a relational configuration in which knowledges, powers, belongings and conflicts are continually produced. It is in this sense that the discussion on territoriality becomes central to the conceptual formulation of territorial listening.

3.3 TERRITORIAL LISTENING AND TERRITORIALITY

If the definition of problems is situated, listening must also be so, since the territory cannot be reduced to an administrative delimitation or a physical base where programmes bear and extension teachers develop their projects according to their own beliefs and methods. In the tradition that articulates Milton Santos and Sérgio Schneider, the territory is a field of relations, uses, powers, identities, flows and disputes, that is, a social reality produced and lived (Santos, 2002; Schneider; Tartaruga, 2004).

The immediate consequence of this premise is that listening to the territory is not equivalent to hearing isolated individuals, but to interpreting relational configurations through which actors, institutions, technical objects and scales of power are articulated.

To make this argument explicit, it is convenient to formulate territorial listening in four complementary conceptual theses: a) Territorial listening is a critique of diagnostic exteriority, where diffusionism is characterised not only by transmitting ready-made responses, but is characterised, even prior to that, by supposing that the problem can already be known from outside, according to technical categories whose validity would be prior to the encounter with the territory (Rist, 2009; Thiollent, 1984).

To listen territorially, therefore, breaks with this presupposition, given that listening does not begin when the institution asks the territory how best to implement a solution, but begins when the very formulation of the problem becomes revisable in the face of territorial rationalities (Marinho *et al.*, 2022).

Its first gesture, therefore, is epistemologically negative: to suspend the diagnostic self-sufficiency of the institution. At this point, territorial listening approaches a critique of heteronomous intervention, because it refuses the naturalisation of agendas elaborated in other centres of calculation and decision (Diniz; Hespanhol, 2019; Thiollent, 1984).

The second thesis sustains that territorial listening is a relational theory of rural space; as Santos (2002) asserts, the territory must be understood as a used territory, an indissociable combination of objects and actions (Santos, 2002). This formulation is decisive because it prevents rural space from being treated as a neutral scenario; beyond the presence of resources, infrastructures or productive units, it concerns the way in which these elements are appropriated in concrete practices, under tensions between external verticalities and the horizontalities of local life (Santos, 2002).

In other words, the territory is traversed by external commands, but also by bonds of proximity, solidarity, experience and resistance. Under this key, territorial listening is not confused with an inventory of local assets, but requires apprehending how the uses of space

condense disputes over time, work, the circulation of information, access to resources and the possibility of social permanence.

Schneider and Tartaruga deepen this view by distinguishing territory as an analytical category and territorial approach as a mode of intervention (Schneider; Tartaruga, 2004, 2005). The distinction is relevant, since while the territorial approach may be appropriated normatively by public policies, the concept of territory refers to relations of power, sense of belonging, social consciousness, distributive conflicts and forms of coordination among actors (Schneider; Tartaruga, 2004).

This means that territorial listening cannot be defined by mere geographical proximity between State and population, but depends on the capacity to reconstruct, within the intervention, the effective mediations through which the subjects self-identify, name their losses, recognise their bonds and perceive their margins of action (Schneider; Tartaruga, 2005).

In this interim, territoriality ceases to be a secondary attribute and comes to function as a central mediation. If the territory is the spatialisation of social and power relations, territoriality may be understood as the set of practices, meanings, appropriations and codes of belonging through which the actors live, delimit and dispute that space (Raffestin, 1987; Schneider; Tartaruga, 2004).

Territorial listening operates, therefore, upon this relational thickness, where it seeks to capture not only what the actors say about the territory, but how the territory is continually produced in their strategies of social reproduction, in their distributive conflicts and in their everyday forms of coordination (Deponi; Almeida, 2012; Santos, 2002). For this reason, its unit of reference is not the locality in itself, but the bundle of relations that makes it exist as a socially significant territory.

The next thesis sustains that territorial listening is a principle of epistemic justice, where the theoretical density of the concept depends on its epistemological base. The ecology of knowledges offers here a decisive step, because it allows breaking with the idea that technical knowledge holds, by itself alone, the competence to adequately name rural reality (Santos *et al.*, 2006; Sousa, 2015).

If different forms of knowledge participate in the intelligibility of the social world, territorial listening cannot be thought of as the simple collection of information to be subsequently translated by the specialist but, on the other hand, must be conceived as a device of recognition of the co-presence of heterogeneous rationalities, whose articulation is always partial, conflictive and situated (Santos *et al.*, 2006; Torres-Rego, 2022). To listen

territorially is, therefore, to redistribute the authority to interpret reality and to define what counts as relevant evidence for action.

The theory of communicative action reinforces this argument by showing that the validity of an intervention cannot rest solely on instrumental effectiveness (Habermas, 1984, 2015). Extension action gains legitimacy and trust when the participants can negotiate common definitions of the situation and submit claims to truth, correctness and sincerity to processes of understanding (Samborski *et al.*, 2017).

From this point of view, territorial listening is not a preparatory stage prior to intervention proper, but is itself the communicative mediator through which intervention ceases to be a strategic imposition and may become reflexive coordination of action.

To listen is to open the technical problem to the test of the social world and the subjective world, and not merely to verify the local adherence of a predefined solution. Epistemic justice, here, is not reduced to recognising subalternised knowledges, but implies constructing procedures by which such knowledges may effectively interfere in the course of the public definition of problems.

Finally, the fourth thesis sustains that territorial listening is a socio-technical condition of actor-oriented innovation; and the analysis of social interfaces shows that public interventions do not enter empty territories, but traverse arenas already structured by strategies, memories, inequalities and their own resources (DePonti; Almeida, 2012; Long, 2001; Long; Ploeg, 1989).

From this perspective, territorial listening must be understood as a reading of the interfaces in which external projects are appropriated, negotiated, deflected or refused. Its unit of analysis is neither the abstract individual nor the idealised community, but the interface where distinct social worlds meet and redefine the course of action (DePonti; Almeida, 2012). This explains why silence, partial adherence and the selective translation of programmes are as relevant as the explicit manifestations of demand.

There is yet another reason to treat territorial listening as a socio-technical category and not merely a sociological one. The literature on co-production shows that problems, evidence, solutions and institutions constitute one another mutually (Jasanoff, 2004; Rist, 2009). Technologies do not arrive ready-made in a previously given social milieu, but reorder relations, distribute capacities and stabilise certain visions of the future, while at the same time being transformed by local uses, resistances and adaptations (Rist, 2009; Stroparo, 2025b).

Territorial listening also requires recognising that the subjects do not belong to a single territory, but transit through multiple territorialities simultaneously. As Haesbaert (2004, 2007)

argues, contemporary territories are marked by processes of multiterritoriality in which different belongings, networks, scales of power and forms of use of space coexist and, frequently, enter into tension. Under this perspective, to listen to the territory does not mean seeking a homogeneous voice of the community, but understanding the socio-territorial textures produced by the interaction between diverse and, at times, conflicting rationalities.

Territorial listening thus becomes the mechanism by which extension can accompany this co-production instead of denying it. To listen is not to delay innovation, but to create the conditions for it to emerge as a territorially intelligible and politically legitimate solution. As a consequence, innovation ceases to be measured solely by adoption and technical performance and comes to be judged also by its capacity to respond to effectively territorialised problems.

In the light of these four theses, territorial listening may be defined as a systematic process of recognition, interpretation and problematisation of the rationalities, temporalities, conflicts, needs, expectations and situated knowledges that structure the used territory. It is an epistemological process because it displaces the production of extension knowledge from the verification of external hypotheses to the co-production of intelligibility about local reality (Santos *et al.*, 2006; Sousa, 2015).

It is, furthermore, a methodological process because it requires observation, dialogue, restitution, interpretative comparison and continual revision of the initial framing, so as to capture not only explicit discourses, but also silences, resistances, self-identifications and distinct scales of belonging (De Ponti; Almeida, 2012; Kersten; Ison, 1998; Marinho *et al.*, 2022).

Consequently, it is a political process because it redistributes the authority to define what matters, which problems deserve priority and under what criteria a solution may be considered pertinent (Samborski *et al.*, 2017; Torres-Rego, 2022).

The four theses discussed converge towards an expanded understanding of territorial listening. In the first place, it constitutes a critique of diagnostic exteriority by questioning the possibility of the prior definition of problems independently of territorial rationalities. Then, it operates as a relational theory of the territory by understanding rural space as a historical configuration of uses, belongings, conflicts and power relations. In the third place, it affirms itself as a principle of epistemic justice by recognising that the legitimate definition of problems depends on the interaction between different forms of knowledge. Finally, it presents itself as a socio-technical condition of innovation, since durable solutions tend to emerge from processes of negotiation, translation and territorially situated co-production. Considered together, these dimensions allow understanding territorial listening as an

epistemological category capable of reorienting extension action beyond the logic of transfer and prescription.

This formulation allows differentiating territorial listening from three impoverished readings. The first reduces it to an initial gathering of data to calibrate already decided projects. The second converts it into a generic participatory repertoire, disconnected from the materiality of territorial relations. The third interprets it as a mere ethical attitude of professional sensitivity, without consequences for the distribution of cognitive authority in intervention. In all these cases, the link between listening, territoriality and the redefinition of the very form of producing public problems in the rural milieu is lost. To listen to the territory is not to gather local information to improve institutional delivery; it is to reorganise the epistemological and political base from which intervention becomes thinkable, justifiable and transformable.

3.4 FROM TRANSFER TO THE CO-PRODUCTION OF PROBLEMS AND SOLUTIONS

Once the problem is redefined, the understanding of innovation also changes. The literature critical of diffusion shows that innovation cannot be conceived as a finished object that travels a linear trajectory between research, extension and adoption (Rist, 2009).

In contexts marked by social heterogeneity, ecological uncertainty and a plurality of knowledges, sustainable solutions tend to arise from processes of co-production, as described by Rist (2009), who discusses this displacement with clarity by opposing transfer and co-production of knowledge. It is argued that, in the face of complex and contested problems, the rigid separation between those who produce knowledge and those who apply it becomes unsustainable. Innovation comes to depend on social learning among farmers, researchers, extension agents and policymakers (Rist, 2009).

In consonance, Jasanoff offers the notion of co-production to think science, technology and social order as mutually constitutive dimensions (Jasanoff, 2004). Applied to the rural milieu, this perspective prevents separating technology from institutional arrangements, values, expectations and forms of collective coordination; and such a perspective is reinforced in the literature on agroecology, where, according to Cotrim (2017), the arenas of construction of agroecological knowledge show that extension professionalism shifts when the technician ceases to be a bearer of packages to act as a mediator, translator of languages and organiser of conditions of encounter (Cotrim, 2017).

The value of intervention comes to reside less in the intrinsic superiority of the offered solution and more in the capacity to sustain processes in which the community participates in the formulation of questions and in the practical validation of responses.

This change also appears in concrete methodological experiences, as described by Kersten and Ison (1998), who base themselves on active listening, interpretative cycles and dialogue meetings to overcome polarised debates between researchers and producers (Kersten; Ison, 1998).

The notion of territorial listening allows giving socio-technical density to these experiences, since it indicates that co-production does not derive solely from participatory methods, but from a reconfiguration of authority over what must be transformed. Without this reconfiguration, participation may be absorbed as a technique of adherence and, on the other hand, innovation gains territorial legitimacy by ceasing to respond only to external metrics of efficiency and coming to incorporate social temporalities, productive repertoires and local criteria of pertinence.

3.5 TERRITORIAL LISTENING AS AN EPISTEMOLOGICAL CATEGORY OF CONTEMPORARY RURAL EXTENSION

If diffusionist extension is organised around institutional supply, the extension that listens is organised around the shared construction of the problem. This difference is more than methodological, since it redefines the epistemology of extension action, the place of the technician and the meaning of public policy.

On the epistemological plane, the extension that listens departs from the recognition that the territory produces socially valid knowledge. This does not imply denying the importance of agrarian science or relativising technical criteria, but refusing its pretension of self-sufficiency to define priorities of intervention (Samborski *et al.*, 2017; Santos *et al.*, 2006; Sousa, 2015).

Technical truth remains relevant, but ceases to operate alone. It must be put into relation with norms, experiences, uses of space and collective expectations. In stronger terms, territorial listening displaces the extension epistemology from a logic of application to a logic of translation and co-production: knowledge does not leave the institution intact for the territory, but is recomposed at the interfaces where technical categories meet heterogeneous social rationalities (Deonti; Almeida, 2012; Jasanoff, 2004; Rist, 2009; Stroparo, 2025a).

On the methodological plane, territorial listening requires continued devices, and not merely inaugural consultations. The central point is not to open a channel for farmers to answer institutional questions, but to construct routines of immersion, observation, restitution, joint interpretation and revision of the course of action (Kersten; Ison, 1998; Marinho *et al.*, 2022). Listening, in this sense, is cumulative and reflexive. It informs the beginning of the

project, but also its permanent adaptation. Its most profound methodological requirement is to compel intervention to remain revisable in the face of the territory, instead of treating diagnosis as a rite of legitimation of previously stabilised decisions (Deponti; Almeida, 2012; Thiollent, 1984).

On the political plane, the extension that listens alters the position of the extension agent. The technician ceases to be the agent who carries ready-made responses and comes to act as a mediator of social interfaces, articulator of scales and facilitator of collective learning (Cotrim, 2017; Deponti; Almeida, 2012). This requires competences distinct from those associated with the old diffusionist professionalism: interpretation of conflicts, translation between languages, reading of territorial asymmetries and the capacity to sustain fragile pacts among diverse actors (Cotrim, 2017; Grícolo *et al.*, 2015). Professional authority does not disappear; it changes its foundation. Instead of deriving principally from the exclusive possession of legitimate knowledge, it comes to depend on the capacity to organise processes in which different knowledges may confront one another without any of them being defined in advance as the sole valid matrix of intervention (Cotrim, 2017; Samborski *et al.*, 2017; Torres-Rego, 2022; Stroparo; Floriani, 2022; 2024).

These transformations do not configure merely a change of procedures, but a broader alteration in the rationality of extension action. While the prescriptive paradigm concentrates on the institutional supply of previously defined solutions, the extension that listens displaces attention towards the processes by which problems, priorities and responses are constructed in the territories. In this movement, farmers cease to occupy only the position of recipients of policies and come to act as cognitive and political subjects of intervention; the extension agent ceases to be exclusively a diffuser of techniques to assume functions of mediation and translation; and innovation ceases to be evaluated solely by indicators of adoption to incorporate criteria of territorial pertinence, legitimacy and adaptive capacity (Stroparo; Floriani, 2026).

This displacement helps to reinterpret even the institutional landmarks of Brazilian ATER. The literature on PNATER shows that the formal adoption of participation, sustainability and agroecology opened space for another normative orientation (Diniz; Hespanhol, 2019). But the same literature evidences that such principles remain fragile when they do not materialise in institutional capacities of listening and mediation (Grícolo *et al.*, 2015; Zarnott *et al.*, 2017). The problem, therefore, is not only the text of the policy, but the persistence of organisational devices that continue treating the territory as a place of execution and not of problematisation.

Territorial listening, as an analytical category, helps to name precisely this gap. Its originality lies in uniting epistemological critique, territorial reading, theory of mediation and socio-technical approach within a single concept. It is not a matter of adding local sensitivity to extension, but of affirming that the legitimacy of extension action depends on its capacity to make the territory a space of co-production of the very terms of intervention. In synthesis, territorial listening designates the passage from an extension founded on the territorial application of solutions to an extension founded on the territorial production of public problems and socio-technical responses. Put differently, it simultaneously redefines what it is to know, what it is to intervene and what it is to innovate in the rural milieu.

Differently from active listening, predominantly directed at the quality of interaction between subjects, territorial listening refers to the institutional capacity to recognise the territory as a legitimate instance of formulation of the problems that orient public action. Its focus is not only on the manner in which one listens, but on the redistribution of authority over that which deserves to be heard.

7 FINAL CONSIDERATIONS

The analysis developed allows sustaining that the principal continuity between classical and contemporary forms of prescriptive extension does not lie only in the diffusion of technological packages, but in the extraterritorial concentration of problem definition. Even when the institutional discourse incorporates participation, dialogue and sustainability, the diffusionist logic may persist if listening remains subordinated to the validation of previously established agendas. The core of the problem, therefore, is not only methodological, but epistemological and political, because it concerns who possesses the authority to name reality, hierarchise urgencies and validate responses in the rural milieu.

It was to respond to this core that the concept of territorial listening was formulated as a category of contemporary rural extension.

The originality of the proposal resides in not treating listening as a moral attribute of the good extension agent nor as an accessory technique of participation. Its status is stronger: territorial listening designates a principle of reconstruction of the very rationality of extension, simultaneously redefining what it is to know, what it is to intervene and what it is to innovate in the rural milieu, by displacing extension from a logic of territorial application of solutions to a logic of territorial production of public problems and socio-technical responses.

The consequence of this formulation is decisive for the debate on socio-technical innovation in the rural milieu. More legitimate, inclusive and sustainable solutions tend to arise when farmers and communities participate not only in the execution or adaptation of

techniques, but in the very construction of the questions that organise the intervention. In this sense, the extension that listens does not represent a mere methodological variant of participatory extension, but expresses a new paradigm, in which the territorial mediation of knowledge becomes a condition for public action to cease operating upon the territories and come, effectively, to operate with them.

If this interpretation holds, the central fragility of many extension projects lies not in the absence of technologies or resources, but in the insufficiency of institutional mechanisms of listening capable of recognising rural territories as legitimate spaces of knowledge production, definition of priorities and co-production of solutions. It is in this displacement that, to a large extent, the possibility of an effectively contemporary rural extension is at stake.

In synthesis, territorial listening does not designate an additional procedure of consultation nor a technique of participatory improvement, but expresses a change in the very epistemological base of rural extension by recognising that the legitimacy of intervention depends on the capacity of the territories to participate in the definition of the problems that orient public action. Under this perspective, the passage from an extension founded on the territorial application of solutions to an extension founded on the territorial production of public problems constitutes one of the central conditions for the construction of effectively contextualised, legitimate and lasting socio-technical processes.

ABSTRACT

This report presents the formative experiences undertaken within the framework of the Institutional Programme for Teaching Initiation Scholarships (PIBID), carried out between November 2024 and June 2025 in a school in the municipality of Nova Iguaçu. The host school received 24 undergraduate students from Universidade Iguaçu, supervised by three teachers in a collaborative partnership. The project, entitled Literacy grounded in phonological awareness and the Boquinhos method, aimed to offer windows of opportunity for active, meaningful learning, full of senses and emotions, enabling knowledge to be constructed in accordance with the way the brain learns, that is, through phonological and visual pathways. It was grounded in scientifically proven theoretical concepts experienced in pedagogical practice at the host school and based on the assessment of children's thinking regarding nominal realism by Piaget (1998) and writing hypotheses according to Ferreira and Teberosky (1997) and Jardini (2014). The methodology adopted was qualitative, participatory and interdisciplinary, prioritising the co-authorship of the undergraduate students and the protagonism of the school community. This approach enabled the collective construction of pedagogical actions, adjusted to the real needs of the educational context, strengthening the articulation between university and school. The use of active methodologies and teamwork broadened the integration between theory and practice, fostering more consistent and reflective learning. The results obtained, assessed on the basis of the undergraduate students' opinions and reflective records, revealed high engagement, satisfaction and enthusiasm in the development of the activities. The experience contributed to consolidating an ethical, inclusive and empathetic pedagogical practice, valuing diverse forms of

RESUMO

O presente relato apresenta as experiências formativas vivenciadas no âmbito do Programa Institucional de Bolsa de Iniciação à Docência (PIBID), realizadas entre novembro de 2024 e junho de 2025, em uma escola do município de Nova Iguaçu. A escola-campo recebeu 24 licenciandos da Universidade Iguaçu, supervisionados por três docentes em parceria colaborativa. O projeto, intitulado Alfabetização fundamentada na consciência fonológica e no método das boquinhos, teve como objetivo oferecer janelas de oportunidades para uma aprendizagem ativa, significativa, repleta de sentidos e emoções, permitindo que o conhecimento seja construído de acordo como o cérebro aprende, ou seja, pelas vias fonológicas e visuais e foi fundamentado em conceitos teóricos comprovados cientificamente e experienciados na prática pedagógica na escola-campo e fundamentado na avaliação do pensamento infantil sobre o realismo nominal de Piaget (1998) e hipóteses de escrita de acordo Ferreira e Teberosky (1997) e Jardini (2014). A metodologia adotada foi de caráter qualitativo, participante e interdisciplinar, priorizando a coautoria dos licenciandos e o protagonismo da comunidade escolar. Esse enfoque possibilitou a construção coletiva de ações pedagógicas, ajustadas às necessidades reais do contexto educacional, fortalecendo a articulação entre universidade e escola. O uso de metodologias ativas e o trabalho em equipe ampliaram a integração entre teoria e prática, favorecendo aprendizagens mais consistentes e reflexivas. Os resultados obtidos, avaliados a partir de pareceres e registros reflexivos dos licenciandos, evidenciaram elevado engajamento, satisfação e entusiasmo no desenvolvimento das atividades. A experiência contribuiu para consolidar uma prática pedagógica ética, inclusiva e empática, valorizando saberes diversos e promovendo o desenvolvimento integral dos educandos, ao mesmo tempo em que reafirma o papel social do professor em formação.

RESUMEN

El presente relato presenta las experiencias formativas vivenciadas en el ámbito del Programa Institucional de Beca de Iniciación a la Docencia (PIBID), realizadas entre noviembre de 2024 y junio de 2025, en una escuela del municipio de Nova Iguaçu. La escuela-campo recibió a 24 estudiantes de licenciatura de la Universidade Iguaçu, supervisados por tres docentes en colaboración. El proyecto, titulado Alfabetización fundamentada en la conciencia fonológica y en el método de las boquinhos, tuvo como objetivo ofrecer ventanas de oportunidades para un aprendizaje activo, significativo, repleto de sentidos y emociones, permitiendo que el conocimiento se construya de acuerdo con la forma en que el cerebro aprende, es decir, por las vías fonológicas y visuales, y se fundamentó en conceptos teóricos comprobados científicamente y experimentados en la práctica pedagógica en la escuela-campo, basándose en la evaluación del pensamiento infantil sobre el realismo nominal de Piaget (1998) y en las hipótesis de escritura según Ferreira y Teberosky (1997) y Jardini (2014). La metodología adoptada fue de carácter cualitativo, participativo e interdisciplinario, priorizando la coautoría de los estudiantes y el protagonismo de la comunidad escolar. Este enfoque posibilitó la construcción colectiva de acciones pedagógicas, ajustadas a las necesidades reales del contexto educativo, fortaleciendo la articulación entre universidad y escuela. El uso de metodologías activas y el trabajo en equipo ampliaron la integración entre teoría y práctica, favoreciendo aprendizajes más consistentes y reflexivos. Los resultados obtenidos, evaluados a partir de informes y

registros reflexivos de los estudiantes, evidenciaron un elevado compromiso, satisfacción y entusiasmo en el desarrollo de las actividades. La experiencia contribuyó a consolidar una práctica pedagógica ética, inclusiva y empática, valorando saberes diversos y promoviendo el desarrollo integral de los educandos, al mismo tiempo que reafirma el papel social del profesor en formación.

1 INTRODUCTION

The Institutional Programme for Teaching Initiation Scholarships (PIBID) of the Ministry of Education of Brazil, managed by CAPES, is an initiative that links higher education to schools and to state and municipal systems and has, among its main objectives, to encourage the training of basic education teachers at higher education level, to strengthen the teaching degree courses of Higher Education Institutions and to enrich the theoretical-practical training of students enrolled in teaching degree courses.

From this perspective, a partnership was established between Universidade Iguazu (UNIG) and the Centro de Educação Especial Paul Harris, which began in 2023 the project Literacy Grounded in Phonological Awareness and the Boquinhas Method, consolidating the host school as a privileged space for innovative pedagogical practices. This project arose from the need to broaden teaching-learning opportunities for all pupils with significant delays in the literacy process, particularly in the post-pandemic period.

Since its implementation, this project was born with the mission of breaking decades of stagnation in an educational system that has historically neglected and condemned approaches and methodologies grounded in scientific evidence, this being a decisive step towards a true transformation in the training of future teachers who already assume the commitment to make a difference in the education of children, young people and adults. Such theoretical and practical knowledge, disseminated in the continuing education programmes offered at the host school and by the Casa do Professor of the Municipal Secretariat of Education to all teachers, trainees and students of the Pedagogy course, has been recognised as fundamental to teacher professional development, as well as to the possibility of significant changes in the way of teaching and learning and in the understanding of cognitive processes. By addressing themes such as cerebral plasticity, the role of emotions in learning, the importance of sleep and attentional processes, the aim is to promote reflections that connect scientific discoveries to the everyday pedagogical context. From this dimension, teachers are encouraged to become acquainted with this prodigious human machine called the 'brain' and to rethink their practices, adopting effective, evidence-based strategies that respect the functioning of the brain and favour pleasurable learning, full of senses, meanings and emotions, in addition to enabling the integral development of pupils.

From this perspective and given the relevance of mastering the stages of teaching-learning for successful literacy, the theoretical basis of this report is grounded in great scholars who have addressed important processes that permeate the assessment of children's thinking and nominal realism (Piaget, 2010); the psychogenesis of written language (Ferreiro e Teberosky, 1999); the hierarchy of the stages of phonological awareness (Silva,

2014, 2019). For the multisensory approach, the Boquinhas Method (JARDINI, 2014) was added to the literacy project. The studies and scientific research of the French mathematician and neuroscientist Dehaene (2012), author of the book *Reading in the Brain*, were also drawn upon, as he is dedicated to understanding the impact of reading on the brain and how it can optimise literacy methods, as well as enabling effective solutions, especially for children and people with dyslexia.

Under the guidance of such theoretical conceptions, it is understood that reading and writing not only transform brain structures but, above all, expand the mind, knowledge, the capacity for reflection, inquiry and critical thinking, also favouring creativity, the construction of new knowledge and cultural enrichment. In this sense, Soares (2003), in her article *Letramento e Escolarização*, summarises that literacy corresponds to the process by which one acquires the mastery of a code and of the skills necessary to use it in reading and writing, that is, the mastery of the technology – of the set of techniques – that enables the exercise of the art and science of writing (SOARES, 2003).

In line with this conception, the relevance of working with phonological awareness stands out, understood as the ability to reflect on the sound structure of the language, from the recognition of words, syllables, rhymes and alliterations to the phonemic level (SILVA, 2014). It is within this field that the Boquinhas Method is inserted, a phono-visuo-articulatory resource that combines auditory perception with orofacial movement and the image of the letter, favouring the multisensory learning of reading and writing, and is based on visible, tangible aspects that are easily recognised by any child (JARDINI; GOMES, 2009; JARDINI; SOUZA, 2006). By integrating these elements, the project sought not only to equip pupils to master the written code, but also to enhance their metalinguistic skills, promoting a more meaningful, pleasurable and inclusive literacy.

The understanding of the literacy process was profoundly transformed by the research of Ferreiro e Teberosky (1999) who, when investigating the construction of the writing system by children, identified different hypotheses that precede the acquisition of the conventional alphabetic system. In light of this understanding, it is recognised that the child already brings with them prior knowledge about writing and, therefore, it is up to the teacher to identify and diagnose at which stage they are, respecting their way of thinking and formulating hypotheses about the written code. This approach breaks with the mechanistic view of literacy and values the subject as active in the process of constructing knowledge.

From this standpoint, the literacy of pupils who present deficits in the reading and writing process, as well as those who present disabilities, are the greatest beneficiaries of this project. In addition to the teachers and students of the school community who receive

training, monitoring, exchange of materials and construction of pedagogical materials throughout the entire training process. In this sense, then, the project enabled us to share knowledge with all the teachers of the school space, of the Municipal Network of Nova Iguaçu and undergraduate students of the Pedagogy course of Universidade Iguaçu, offering opportunities for reflection on their pedagogical practice and on the importance of the teacher understanding, from the standpoint of neuroscience, the best paths and methods that lead pupils to achieve success in literacy, but in a pleasurable way, full of senses and meanings, respecting the way the brain learns, that is, through the sensory pathways.

Since the implementation of the Literacy Project, the entire school community has been benefiting. The methodology used favours respect for the needs of the pupils, as well as the possibility of beginning the literacy process in early childhood education in a playful, concrete way, through stimulation for cognitive maturation, skills and auditory/phonological awareness as proposed by Carla Silva.

The famous phrase of Lewis Carroll, in the classic *Alice in Wonderland*, "When you don't know where you want to go, any road will do", illustrates that the lack of a clear objective and destination makes any direction valid, leading to unexpected and sometimes negative and frustrating results. In the same way, the literacy process devoid of well-defined strategies and goals and marked by a lack of knowledge about the most appropriate paths to follow compromises the efficiency of teaching and the success of learning, both for the teacher and the pupil.

From this understanding, Dehaene (2012, p. 16) provokes a pertinent reflection by asking: "Can it be accepted that a cultured person knows better the functioning of their car or their computer than that of their own brain?". Such questioning reinforces the urgency of grounding pedagogical practices in scientific evidence about brain functioning, in order to guide more effective methodologies in literacy.

When one is unaware of how the brain learns, as well as of methodologies that bring security to the teaching-learning process, one runs the risk of making pupils subjects who begin the school year and end it without any change in their brain structures.

2 METHODOLOGY

The project Literacy Grounded in Phonological Awareness and the Boquinhas Method was constructed in a systematised and organised way according to the different stages of the literacy process, while also paying attention to the importance that no knowledge should be superimposed on another without the previous one being consolidated. The pupil in their

literacy process has bases that must be respected and that concern cognitive and psychomotor maturation and awareness of the aspects related to phonological awareness.

During this 2024/2025 period, 03 area supervising teachers and 24 PIBID participants from the Pedagogy course of Universidade Iguazu took part in the Institutional Programme for Teaching Initiation Scholarships (PIBID); they were allocated to 14 classes, of which children diagnosed with Down syndrome, autism, intellectual disability, ADHD, among others, are part.

Table 1

Number of participants in the PIBID of UNIG/CEE Paul Harris

Classes participating in PIBID	Classes	Participating pupils	Participating PIBID students
Early Childhood Education	2	34	4
1st year	2	33	4
2nd year	2	30	4
3rd year	2	30	4
4th year	2	29	4
5th year	1	20	1
6th year – special class	1	13	1
7th year – special class	2	27	2
TOTAL	14	216	24

Source: prepared by the authors.

The project was developed in the following stages:

- Initial and continuing training for students and the school community in face-to-face and online formats.
- Daily monitoring of the routine of the PIBID students through guidance, completion of forms and learning records.
- Construction of pedagogical materials by the PIBID students and supervisors.
- Assessment of Nominal Realist Thinking, according to Piaget.
- Assessment of the writing hypothesis.
- Stimulation of basic auditory skills.
- Stimulation and development of the stages of phonological awareness (auditory skills, word, sentence, syllable, rhyme and alliteration awareness).
- Stimulation of phoneme and phonemic awareness through the Boquinhas Method – a phono-visuo-articulatory methodology.

In the course of the project stages, the PIBID students were able to put into practice the theoretical foundations concerning diagnostic assessment, according to Piaget (2010) who, in accordance with his studies, holds that nominal realism is a characteristic of children's thinking by virtue of which the child expresses difficulty in dissociating the sign from the thing signified. This assessment makes it possible to understand and perceive the child's cognitive

maturity regarding writing. In this sense, the following question is posed: Which is the longest word? Joanelha (ladybird) or porco (pig)? Caminhão (lorry) or pé (foot)? Through their answers we observe the cognitive maturity in which the child will answer understanding that we are speaking about writing (the signifier) or about the attributes/characteristics (the signified). According to the logic of children's thinking, the child's answer is based on the attributes of the objects and not on the writing of the word. Some arguments used by the children were: porco (pig) is the longest word, because it is big. Joanelha (ladybird) is small because it has wings. The interventions were directed at leading the child to perceive the length of the word by counting the number of syllables, using objects such as bottle caps, modelling clay and the body as a strategy for understanding writing. Auditory skills should always be stimulated, seeking to associate that writing represents the sounds of speech (grapheme/phoneme).

During the second stage, an assessment was carried out regarding the writing hypothesis, according to the Psychogenesis of Writing. For the assessment, four (4) words were chosen in the following order: polysyllable, trisyllable, disyllable and monosyllable. After the drawing, the writing, reading and construction of a sentence, the analysis was carried out as proposed by Ferreiro (1999), who classifies them into four phases: pre-syllabic, syllabic with and without sound value, syllabic-alphabetic, alphabetic. We also added the iconic and scribbling phases of child development. The other pedagogical assessments and interventions are those pertinent to the stages of phonological awareness (word, sentence, syllable, rhyme, alliteration and phoneme awareness). The assessments and interventions address dynamic, playful, meaningful strategies and practices, in addition to the stimulation of auditory skills, based on the assumptions of Silva (2014; 2019). In a further stage, the Boquinhas Method of Jardini (2024) was added to the project owing to its scientific validity, and because it has its multisensory bases – phono-visuo-articulatory (phonic strategies: phoneme/sound) and visual (grapheme/letter) and articuleme (boquinhas).

By better understanding the methods and their applications in educational practice, we will be able to identify opportunities for improvement and to enhance the benefits of these approaches for the teaching-learning process, especially in the context of children's literacy.

3 RESULTS AND DISCUSSION

The assessment of pupils' learning, according to the Psychogenesis of writing, made it possible, over a period of two months, to verify the advances in the understanding and phonological awareness of writing, proving the efficacy and effectiveness of the methodology used. In this sense, having evidenced the paths towards a scientifically proven pedagogical

practice, it was decided to enable the undergraduate students of the Pedagogy course of Universidade Iguaçu (UNIG) to experience knowledge, theoretical and practical understanding through the Programme of Pedagogical Residency in 2022/2023 and the Programme for Teaching Initiation (PIBID) 2024/2025 at the host school Centro de Educação Especial Paul Harris. The teacher training of the undergraduate students of Universidade Iguaçu, in a regime of collaboration with the public school, enabled, in the field of teaching practice, the theoretical-practical training, providing skills and competencies for the professional exercise of the future teacher.

The results achieved by the Programme at the Centro de Educação Especial Paul Harris reveal that it was an experience of great scope and formative impact. The project involved 14 classes, with 216 pupils, from early childhood education to special classes of primary education, and counted on the direct participation of 24 Pedagogy undergraduate students, under the guidance of three supervisors. These figures evidence the dimension of the work and its relevance for the school and for initial teacher training.

The diversity of the classes – which included pupils with autism, Down syndrome, ADHD and intellectual disability – constituted fertile ground for applying literacy strategies based on phonological awareness and the Boquinhas Method. The work of the undergraduate students enabled the activities to be developed in a more personalised and inclusive way, respecting the rhythms of learning and ensuring that no pupil was left out of the process. This movement strengthens the distinctive character of the Centro Paul Harris, which consolidates itself as a school that does things differently, by adopting methodologies grounded in scientific evidence, and makes a difference, by offering concrete opportunities for development to all pupils.

The reflective records of the PIBID students indicated that the experience in heterogeneous classes broadened their understanding of literacy as a complex process, which requires careful diagnosis and pedagogical practices adjusted to the stages of cognitive maturation. Contact with real situations – such as the difficulties in nominal realism (Piaget, 2010) or the different levels of writing hypotheses (Ferreiro & Teberosky, 1999) – became an essential formative laboratory, uniting theory and practice.

Furthermore, the figures reinforce that the reach of the project was not restricted to one-off experiences: by involving more than two hundred pupils, the impacts were collective and multiplying. This is translated into the strengthening of the partnership between university and school, but also into the appreciation of a model of initial teacher training based on collaboration, interdisciplinarity and research in action.

The scope of the project demonstrates not only its pedagogical dimension, but also its social and political impact, by strengthening the integration between university and basic education. In the case of PIBID at the Centro de Educação Especial Paul Harris, the quantitative data reveal that the experience is not restricted to isolated actions, but constitutes itself as a public policy of training, with direct repercussions on the quality of teaching, on school inclusion and on the appreciation of the social role of the university. The data also reveal challenges, since the presence of a large number of classes with distinct characteristics requires diversified strategies, which, at times, generated difficulties for the undergraduate students, especially in the balance between time, resources and methodological adaptation. Even so, such challenges were converted into formative learning, reaffirming the importance of supervised practical experience in constructing knowledge in a collective and participatory way, which are fundamental requirements for students to be able to apprehend and articulate theory and practice.

4 FINAL CONSIDERATIONS

The experiences developed at the Centro de Educação Especial Paul Harris, within the framework of PIBID, confirm that pedagogical practices grounded in scientific evidence and combined with practical experience constitute a promising path to transform the literacy process and, at the same time, to strengthen initial teacher training. The presence of 24 undergraduate students, distributed across 14 classes and in direct contact with 216 pupils, demonstrated that the host school is configured as a space of innovation, reflection and social commitment.

The literacy project grounded in phonological awareness and the Boquinhas Method proved to be an inclusive and effective resource, especially in view of the specific needs of pupils with intellectual disability, autism, ADHD and Down syndrome. By adopting multisensory methodologies, the school showed that it is possible to overcome traditional practices centred on repetition and memorisation, valuing the child as an active subject in the construction of their own learning.

In the dimension of teacher training, PIBID enabled the undergraduate students to experience teaching as a reflective, ethical and collaborative practice, breaking with the distance between theory and practice. At the same time, it consolidated the role of the university in articulating with basic education, fulfilling its social function in accordance with Resolution CNE/CES nº 7/2018 on the curricularisation of extension.

Finally, the Centro Paul Harris proved to be more than a school: it became a space of collective transformation, where each pedagogical action is guided by the commitment to

inclusion, equity and the quality of learning. Thus, the meaning of the title of this report is reaffirmed: by assuming practices that break with the traditional and open up to the new, the Centro Paul Harris is a school that not only does things differently, but, above all, makes a difference in the lives of pupils, teachers and future teachers.

ABSTRACT

Cervical cancer is the fourth most common cancer in women worldwide and the third most prevalent type among women in Brazil. The mortality rate in Brazil, adjusted to the world population, was 5.33 deaths per 100,000 women in the latest triennium (2019-2022). Cervical cancer screening uses as a first line the traditional Papanicolaou test, visual inspection with acetic acid and Lugol's iodine, liquid-based cytology (LBC) and, in some cases, molecular tests for oncogenic HPV subtypes. Although advances have been made over the years, conventional screening procedures still suffer from diagnostic subjectivity, leading to false-positive and false-negative results. The present study aims to compare the main cytomorphological features that distinguish low-grade (LSIL) and high-grade (HSIL) squamous intraepithelial lesions, by means of images captured through optical microscopy and through the Pickcells automated system using the Pickcells Path scanner. To this end, five samples of each intraepithelial lesion, LSIL and HSIL, were selected. The criteria analysed, based on the Bethesda system, were the nuclear-cytoplasmic ratio, hyperchromasia, nuclear membrane contour and pleomorphism. The results obtained by the automated capture method were superior to the manual method, as they better highlighted the cytomorphological patterns characteristic of the lesions. Therefore, computer-assisted or automated cytology emerges as a perspective in the diagnosis of cervical carcinoma. The growing interest in the development of software and automated systems for cervical cancer screening aims to optimise analysis time, avoid ambiguity, eliminate false negatives and minimise the mortality rate.

rastreamento do câncer do colo do útero utiliza como primeira linha o exame de Papanicolau tradicional, inspeção visual com ácido acético e iodo de Lugol, citologia em meio líquido (LBC) e em alguns casos, teste moleculares para subtipos oncogênicos do HPV. Embora tenha havido avanços ao longo dos anos, os procedimentos de triagem convencionais ainda sofrem com as subjetividades do diagnóstico, ocasionando resultados falsos positivos e negativos. O presente trabalho tem como objetivo comparar as principais características citomorfológicas que distinguem as lesões intraepiteliais escamosas de baixo (LSIL) e alto grau (HSIL), por meio de imagens capturadas pela microscopia óptica e pelo sistema automatizado da Pickcells através do scanner Pickcells Path. Para este fim, foram selecionadas cinco amostras de cada lesão intraepitelial, LSIL e HSIL. Os critérios analisados, baseado no sistema Bethesda, foram a relação núcleo citoplasma, hipercromasia, contorno da membrana nuclear e pleomorfismo. Os resultados obtidos pelo método de captura automatizado foram superiores ao método manual, uma vez que evidenciaram melhor os padrões citomorfológicos característicos das lesões. Portanto, a citologia assistida por computador ou automatizada surge como uma perspectiva no diagnóstico do carcinoma cervical. O crescente interesse no desenvolvimento de softwares e sistemas automatizados para o rastreio do câncer do colo do útero visa otimizar o tempo de análise, evitar ambiguidade, zerar falsos negativos e minimizar a taxa de mortalidade.

1 INTRODUCTION

Cervical cancer is the fourth most frequent neoplasm in women, excluding non-melanoma skin cancers, occupying the seventh position in the global ranking. In Brazil, the estimate for 2020 was 16,710 new cases, representing a rate of 7.5%, ranking only behind non-melanoma, breast, and colon and rectum cancers (INCA, 2020). This neoplasm is the leading cause of death among women in Latin America and the Caribbean (OPAS, 2021) (WCRF, 2021). In 2020 alone, about 604,000 women were diagnosed with cervical cancer worldwide and about 342,000 women died as a consequence of the disease (ASCO, 2022). In addition, the high incidence and mortality rates in underdeveloped and emerging countries reinforce cervical cancer as a public health problem, as it is directly linked to inequalities in income, gender and access to health services (WHO, 2021). The main cause of this neoplasm are high-risk human papillomaviruses, HPV 16 and 18, responsible for about 50% of cervical pre-cancers, which represent the primary cause of pre-cancerous or cancerous cervical lesions (IARC, 2021).

Although almost every type of cervical cancer is linked to HPV infection, more than 90% of patients eliminate the virus spontaneously, 6 to 12 months after contagion, owing to the immune response (Zhang *et al.*, 2020). However, a small percentage of these squamous intraepithelial lesions persist and may cause the establishment of neoplasia (Crosbie *et al.*, 2013). According to the third edition of the Bethesda System for Reporting Cervical Cytology (2015), there are four categories of squamous cell abnormalities: atypical squamous cells (ASC), low-grade squamous intraepithelial lesion (LSIL), high-grade squamous intraepithelial lesion (HSIL) and squamous cell carcinoma (Wang *et al.*, 2019).

In this context, LSIL is characterised by viral cytopathic changes. These changes include cytoplasmic clearing, nuclear enlargement, nuclear membrane irregularity, hyperchromasia, binucleation or multinucleation and anisonucleosis. The cells show squamous maturation and the nuclear-to-cytoplasmic ratio remains low (Chiaffarano, 2017). On the other hand, HSIL is a lesion of immature squamous cells, and the nuclear atypia (hyperchromasia, irregular chromatin distribution and irregularity of the membrane contour) is more severe than in LSIL (Alexander, 2019). Even though there is cytological distinction between LSIL and HSIL, there is a discrepancy rate of 10% to 15% among pathologists regarding the interpretations of squamous intraepithelial lesion on cervical cytology slides (Bethesda 2015).

Non-neoplastic conditions, including inflammation, atrophy with degeneration, hormonal factors, among others, can interfere with the result and produce cytomorphological changes that lead to questionable considerations regarding the designation of atypical

squamous cells of undetermined significance (ASC-US), atypical squamous cells cannot exclude a high-grade squamous intraepithelial lesion (ASC-H), (LSIL) and (HSIL) (Singh *et al.*, 2015). In addition, pre-cancerous lesions may be small and there are possible variations in location and quantity of diagnostic cells.

Therefore, to carry out screening by the conventional method, a screening lens of lower magnification is initially used, through the 10x objective lens. From the possible location of cytological abnormalities or the presence of aetiological agents, the lens is changed to 40x in order to visually detect these morphological changes and classify them through a high-power lens (Pankay, 2018). The time required for screening varies between 5 and 10 minutes, depending on the complexity of the sample, the inflammatory background and the appearance of cellular abnormalities according to the degree of the lesion. Owing to the long working hours, the number of samples per cytologist and possible interferences in the observations according to the degree of exhaustion of the professional, it is recommended that analysts do not work more than 7 hours a day and analyse a maximum of 70 samples per day (Pantanowitz *et al.*, 2009).

Therefore, it is known that conventional cervical cytology, through microscopic examinations for cytomorphological evaluation of cytological smears, is the most widely used method in defining thresholds for cervical cancer screening and treatment. The Papanicolaou test, also known as the cervicovaginal smear, is based on reading the smear and identifying the degree of loss of cytoplasmic maturation, the presence of abnormal mitotic figures and changes in the shape and size of the nucleus (Febrasgo, 2019). In addition to the Papanicolaou test, visual inspection with acetic acid and Lugol's iodine, liquid-based cytology and HPV testing are considered the main screening methods (WHO, 2019).

In the last decade, cervical cancer screening by traditional cytology has been questioned owing to variations in accuracy, since the specificity in detecting abnormal cells can generate ambiguities and possible biases of the human eye can interfere in the diagnostic process of the patient (Khan *et al.*, 2017). From this, and from the degree of demand and specificity required by conventional screening (a repetitive method requiring costly labour), automated screening emerges as an important tool in the early diagnosis of cervical cytological lesions (Conceição *et al.*, 2019).

It is known that computer-assisted cytology, or digital cytopathology, can expand comparative cytomorphological analysis, increasing sensitivity in the detection of cytomorphological patterns. It enables the visualisation of abnormalities in small squamous and glandular cells, known for the difficulty of detection and classification in the conventional

method, owing to cellular overlapping and the variety of backgrounds on the slide (Jusman *et al.*, 2014).

This technique can also increase the specificity of the examination, selecting only lesions corresponding to reproducible criteria. Furthermore, automated screening optimises analysis time, increases productivity by excluding normal samples, assists the cytologist's work, allows the selection of atypical images from a slide to be verified, increases the number of slides analysed, allows greater discussion in cases that are difficult to conclude, facilitates sample review in doubtful cases and reduces the physical space for permanent storage of results (Yu *et al.*, 2018).

Several methods for computer-assisted screening have been reported in the academic-scientific literature. These include automated screening with slide scoring, risk-based stratification of the presence of abnormalities, and location-guided search. The latter stands out for presenting greater potential in identifying abnormal cells (Bi *et al.*, 2019). The application of computer-assisted cytology to aid the diagnosis of cervical lesions is of great necessity for the expansion and standardisation of diagnostic analyses. In view of this, the present study aims to analyse, by comparison, the cytomorphological patterns of conventional and computer-assisted cervical cytology, using a cytopathological scanner.

2 MATERIALS AND METHODS

For the comparative study of the images, a total of ten cervical cytology slides were analysed, five of each smear lesion using the original Papanicolaou staining technique. The samples were provided by the Laboratório de Pesquisas Citológicas e Moleculares (LPCM) of the Universidade Federal de Pernambuco.

The slides were selected, reviewed and previously analysed by two cytopathologists from the LPCM; the double-blind methodology was used and they were interpreted based on the Bethesda classification system (2015). Five cases were characterised as low-grade squamous intraepithelial lesion (LSIL) and five cases as high-grade squamous intraepithelial lesion (HSIL).

With regard to the analyses, the application of the conventional method by conventional light microscopy was carried out with an optical microscope, model Nikon Eclipses E200MV R, using the 10x objective for screening the lesions and the 40x objective for characterising them. The computer-assisted analysis was carried out on an automated microscope from the company PickCells, a partner in the construction of this study, named PickCells Path, which performs the scanning of cytocervical slides and enables analyses with magnification of up to 40x.

The PickCells Path is a hardware and software solution, with end-to-end artificial intelligence algorithms, aimed at digital pathology. In this solution, the equipment moves through a pre-established function in order to scan the selected area of the slide, performing focus on the various fields and capturing the images automatically. The PickCells Path is an easy-to-handle piece of equipment, capable of performing readings with magnifications ranging between 10x (0.612 $\mu\text{m}/\text{pixel}$) and 40x (0.153 $\mu\text{m}/\text{pixel}$). Sample registration, slide reading, formation of the scanned image and the customised image visualisation tools are performed end-to-end by the automatic scanner. The equipment weighs 24 kg and has dimensions of 41x42x36 cm, and supports the analysis of up to six slides per tray.

After the slide captures, whether by the automated or conventional method, all images were analysed following the classification criteria for LSIL and HSIL recommended by the Bethesda system. The results were compared to enable the refined analysis of structures between the two methods.

3 RESULTS

The main cytomorphological features used to compare the accuracy of the images captured by the conventional method (optical microscopy) and computer-assisted (Pickcells Path scanner) were nuclear morphology, nuclear-cytoplasmic ratio and cytoplasmic appearance.

In LSIL cells, the presence of a nucleolus was not evidenced in the images captured by the scanner. However, the sharpness of the images allowed chromocentres to be visualised. The chromocentres appear relatively smaller than the nucleoli, and poorly defined, with a basophilic staining pattern similar to chromatin (Figure 1A). This simple and important morphological finding is difficult to assess in the conventional method owing to the overlapping of granular heterochromatin (Figure 1B).

Figure 1

Presence of intermediate cells with characteristics of low-grade squamous intraepithelial lesion (LSIL). A: cell in monolayer, photograph taken by the conventional method; B: isolated cell, photograph taken with the PickCells scanner. Both photographs were captured using 40x magnification

Source: prepared by the authors.

One of the most important diagnostic features used during the interpretation of epithelial cell abnormality is based on nuclear enlargement. In the conventional method it was possible to establish this nuclear/cytoplasmic ratio (Figure 2A). However, through the scanner of the Pickcells Path platform, we were able to identify with precision this difference in proportionality, with nuclear enlargement of more than three times the area of normal intermediate nuclei (Figure 2B), resulting in a low nuclear-cytoplasmic ratio, but slightly increased when compared with the normal intermediate cell.

Another relevant finding observed in the image obtained by the Pickcells Path scanner was the possibility of observing the nuclear membrane contour. In some cells the nuclear membrane presented an irregular appearance with indentations or 'notches' (Figure 2B). This detail was not easily identified in the conventional method (Figure 2A). There is also the possibility of focus adjustment, ruler and zoom quality.

Figure 2

Nuclear/cytoplasmic ratio in LSIL cells. (A) image obtained from the optical microscope, comparison of the size of the nucleus of the normal intermediate cell and of LSIL. Smooth nuclear membrane (arrowhead). (B) image obtained from the scanner, presence of indentation in the nuclear membrane

Source: prepared by the authors.

The cells presented a well-defined, dense 'mature' and abundant cytoplasm (Figure 3A). In some cells we identified clearly demarcated perinuclear cytoplasmic clearing (koilocytosis) with an irregular contour with focal angulation, which is characteristic of the HPV cytopathic effect (Figure 3B).

Figure 3

Presence of koilocytes in lesion cells classified as LSIL. (A) image obtained from the optical microscope, presence of a perinuclear halo without details in the contour. (B) image obtained from the scanner, presence of a perinuclear halo with details in the clearly demarcated irregular contour

Source: prepared by the authors.

In cells of lesions classified as HSIL we evidenced marked nuclear pleomorphism (Figure 4A). Although this finding is relevant for the HSIL classification, by the conventional method we were not able to easily identify other features such as the presence of nuclear grooves.

On the other hand, the images obtained by the Pickcells Path scanner made it possible to clearly identify squamous cells with the appearance of immature 'basal' cells (Figure 4B). This is a relevant fact because it generates much subjectivity during conventional analysis and induces the false-negative diagnosis for HSIL.

Figure 4

Lesion cells classified as HSIL. (Left) image obtained from the optical microscope, presence of pleomorphism and anisonucleosis. (Right) image obtained from the scanner, presence of atypical mature squamous cells, with the appearance of immature cells and eosinophilic cytoplasm

Source: prepared by the authors.

The images captured by the Pickcells automated microscope presented satisfactory results in relation to the sensitivity and specificity of the criteria established for the analysis of abnormal alterations in cellular morphology. Analysing a syncytial grouping by both methods, it is possible to perceive that in the photographs obtained by the scanner the appearance of the chromatin is more evident, varying from slightly to coarsely granular and distributed homogeneously (Figure 5B).

Furthermore, in the conventional method the cytoplasm has a more cloudy or indistinct appearance, without delimitation of the cytoplasmic borders between cells (Figure 5A). In the scanner, on the other hand, we identified delicate, immature, or densely metaplastic cytoplasm, with defined borders between cells (Figure 5B).

Figure 5

Syncytial grouping. (A) image obtained from the optical microscope, poorly delimited cytoplasm, with no space between cells. (B) image obtained from the scanner, immature cytoplasm, alteration in the size and shape of the nucleus

4 DISCUSSION

Establishing the evaluation criteria for cervical cytology is of paramount importance for accurate diagnosis. However, depending on the qualitative and quantitative limitations of the sample, some equivocal morphological features suggestive of squamous cell abnormality may lead to a questionable diagnosis.

Analyses from the IARC website demonstrate the disparity among cytopathologists in the interpretation of cervicovaginal smear samples. In an HSIL sample, suggested by the authors, 200 professionals classified it as atypical squamous cells (ASC-H), approximately 110 as LSIL, 80 as ASC-US, 20 as only inflammation and 185 as HSIL. These data reinforce the need to use more sensitive and specific tools in diagnosis.

Many researchers believe that telecytology can contribute to minimising mistaken interpretations. According to the study carried out by Greon and collaborators (2017), digital cytology demonstrated agreement rates between 81% and 90% of intermodality among three observers who had sufficient training in digital cytopathology. The authors identified that the most observed incompatibility in all the data was between ASC-US/atypical squamous cells, cannot exclude high-grade squamous intraepithelial lesion (ASC-H) and LSIL, which may indicate low reproducibility of the recognition of koilocytosis or koilocytotic atypia, followed by the discrepancy between LSIL and HSIL, suggesting difficulty in recognising varied levels of cellular atypia.

According to the Bethesda 2015 system, unequivocal features of LSIL with definitive interpretation that most generate subjectivity in samples are: drying of the sample, presence of navicular cells, inflammatory changes, degeneration process, folic acid deficiency, repair,

radiation and atrophy. The presence of hyperchromasia, unchanged cytoplasm, binucleation and smooth nuclear membrane reflects difficulty in the differential diagnosis between ASC-US and LSIL (Chivukula *et al.*, 2006; Chiaffarano *et al.*, 2017).

In general, hyperchromatic nuclei with coarse chromatin in LSIL cells do not have nucleoli. However, this simple and important morphological feature may be difficult to assess owing to cellular overlapping. With the advent of assisted cytopathology, these peculiarities are already possible to visualise.

One of the main and easily identifiable cytomorphological features of LSIL is koilocytosis. In the images obtained from the scanner, koilocytes show altered nuclei with clearly delineated perinuclear cytoplasmic clearing with an irregular contour. This result is important to rule out aspects that mimic LSIL, such as pseudokoilocytosis. These details were not clearly evidenced under light microscopy. Koilocytes are mature squamous cells with recognisable nuclear and cytoplasmic changes. They derive their characteristic morphology largely owing to productive HPV infection. They are characterised by perinuclear cavitation, binucleation, nuclear hyperchromasia and nuclear enlargement (Alrajjal *et al.*, 2021).

Many studies question the diagnostic accuracy of digital cytology. However, the cytological literature relates about 93% to 86% accuracy of the diagnosis of cervical cytology (House *et al.*, 2013). In this study it is proven that, in fact, the cytomorphological features are more highlighted in the images obtained by the scanner, thus enabling the evaluation of the peculiarities of each type of lesion.

According to Vodovnik *et al.*, 2016, what makes telecytology attractive is (1) time: the images analysed by light microscopy took on average 5.5 times longer to be screened; (2) sample quality: clarity and richness of detail; (3) diagnostic confidence and agreement: the images analysed use the software's AI as a reference; (4) increased productivity of pathologists; (5) real-time information sharing; (6) review of results by more than one cytopathologist; (7) reduction of physical space: storage of digital files.

Furthermore, the analysis and interpretation of samples through digital cytology allows for the description of the samples. It is worth highlighting that the Pickcells automated system already has a post-analysis tool that simulates a tape measure to measure the size of the nucleus. This is of great value for establishing the nuclear/cytoplasmic ratio and characterising the type of lesion according to the criteria.

Owing to the resolution capacity of the scanner, it was possible to easily identify significant nuclear atypias characteristic of HSIL. The morphological changes observed in HSILs are similar to, but distinct from, those of LSIL. HSIL cells have a high nuclear-cytoplasmic volume ratio, greater nuclear hyperchromasia, complex nuclear membrane

irregularities and marked variation in nuclear size (Alrajjal *et al.*, 2021). Irregularities in the nuclei of HSIL cells are one of the most reliable diagnostic features of this lesion and reflect profound disarrangements in cellular function and genetic instability. Hyperchromasia and nuclear enlargement are often striking in HSIL and, like koilocytosis, reflect the increase in DNA content (Hassanpour & Dehghane, 2017).

The variation in the size and shape of the nucleus (anisonucleosis) is a manifestation of genetic instability, aneuploidy and cell-to-cell variation in the karyotype. The amount of cytoplasm reflects the degree of maturation of squamous cells and is an important feature in the classification of squamous intraepithelial lesions as LSIL or HSIL. With LSIL, the cytoplasm is abundant, equivalent to that observed in intermediate squamous cells. With HSIL, the cytoplasm is less abundant, tending towards scarcity, equivalent to that observed in basal and parabasal cells. The accuracy of the image pattern obtained by the scanner made it possible to exclude common problematic patterns of HSIL that include cases of squamous metaplasia, presence of histiocytes, pseudoparakeratosis, grouping of basal and parabasal cells in atrophy (Neto, 2020).

The growing interest in the development of automated diagnostic systems for cervical cancer screening is closely related to the difficulties encountered in characterising the lesion. The automated detection of abnormal changes in cellular morphology brings greater accuracy and reduces the subjectivities of diagnosis. Furthermore, automated cytology can detect a greater number of potentially ill patients, minimise false negatives, without losing sensitivity and specificity, and assist in manual diagnosis (Bertram *et al.*, 2022).

However, digital cytology has been somewhat limited compared to whole-slide imaging. One of the main reasons is the inability to focus on cytology materials, such as thick smears, obscured material, three-dimensional cell groups, overlapping cells and even smears that extend beyond the coverslip of a glass slide. Cost is also important to evaluate when considering these two technologies. The automated system requires a microscope, a whole-slide scanner, camera, computer and software, whereas light microscopy requires a microscope, computer and camera. Maintenance costs are relevant for both solutions (Hanna *et al.*, 2017).

5 CONCLUSION

For years, the conventional Papanicolaou smear cytology technique has been used as an effective screening test for cervical cancer. However, the limited sensitivity and specificity of cervical cytology in revealing cervical cancer, at its early stage, and its precursors has been questioned. Moreover, it is seen that although there are specific

distinctions and characterisations between LSIL and HSIL, there is a discrepancy rate of 10% to 15% among pathologists, leading to erroneous results and to repercussions in the prognosis and treatment of these patients.

With regard to conventional analysis, the increase in false-positive and false-negative results is increasingly seen, which cannot be totally prevented and tends to appear more frequently owing to human interferences in the process, such as variations between the human eye, differences in analysis among professionals, difficulties with the increase in the work routine, among others. In view of this, the pursuit for the development of computer-assisted solutions for cervical cancer screening becomes increasingly common, since it enables the increase in sensitivity in the detection of cytomorphological pattern, allowing the visualisation and classification of abnormalities, in addition to generating possibilities of diagnostic sharing and counter-evidence of the lesions through images. Therefore, the technique increases the specificity of the examination, since it allows the selection of specific areas, optimises analysis time, increases productivity and reduces the storage of material (Yu *et al.*, 2018).

In view of this, this study aimed to carry out a comparative analysis between the visualisation of cervical cytological slides, by means of two visualisation methods, the conventional and the automated, in order to evaluate the possibility of cytomorphological characterisation and definition through each technique. For this, 10 slides were selected from the Laboratório de Pesquisas Citológicas e Moleculares (LPCM), which were analysed by independent cytopathologists, by means of a double-blind, being characterised through the Bethesda system as 5 LSIL and 5 HSIL. The conventional analysis was carried out by means of an optical light microscope (Nikon Eclipses E200MV R) and the automatic analysis carried out by an automated scanner from PickCells (PickCells Path), a partner company of the study. The cytomorphological features analysed were nuclear morphology, nuclear-cytoplasmic ratio and cytoplasmic appearance.

In this study, it is seen that the conventional method limited the analysis of some patterns such as nuclear pleomorphisms in HSIL lesions, the presence of nuclear grooves in them, the difficulty of delimiting the nuclear membrane contour, in addition to generating images with cytoplasm of a more indistinct appearance, without delimitation of the borders between cells. However, this method made it possible to establish the nuclear-cytoplasmic ratio, important for the characterisation and determination of the lesions.

Regarding the images obtained by the scanner, they generally brought satisfactory results with the possibility of detailing and a refinement process in the image, with only a few negative points, such as the difficulty of evidencing nucleoli in LSIL slides. On the other hand,

the images obtained by the PickCells Path scanner proved to be detailed and capable of demonstrating the main structures such as the chromocentres, the difference in comparative proportionality between cells in the nuclear-cytoplasmic ratio, the nuclear membrane contour, cells with the appearance of immature 'basal' cells, among others. Therefore, in general, the images generated by the PickCells Path scanner presented satisfactory results among the established cytomorphological criteria.

If we analyse the comparison between the visualisations of both methods, we have that the images generated by the scanner highlight the appearance of the chromatin, the proportionality of the nuclear-cytoplasmic ratio and the definitions in the cellular cytoplasm. The images analysed by optical microscopy, on the other hand, appear with the cytoplasm indistinct and poorly delimited, in addition to it not being possible to delimit the proportion of the nuclear-cytoplasmic ratio nor the presence of koilocytosis through them. Therefore, owing to the resolution capacity of the automated method, it was possible to identify the significant nuclear atypias in the analysed groupings.

Therefore, it is concluded that the Pickcells automated system offers a viable solution for screening and interpreting cervical cytology samples owing to the structural detailing of cells, through zoom, placement and image quality. It is interesting to highlight that the use of this technology depends on cytologists who are well trained in the use of this system, so that reports are not issued in a way that invalidates the sample results. In addition to this, comparative trials should be carried out and limitations such as cost and analysis time should be raised in subsequent studies.

ABSTRACT

Considering the advances in Neuroscience and artificial intelligence, along with the growth of Neurotechnologies, the general objective of this work is to understand the ethical implications of new technologies in Neuroscience—particularly those involving neuromodulation and brain imaging—within a time frame of the last twenty years, in order to capture the technological period in which these technologies expanded. The study is developed through bibliographic research, and the method of approach adopted is the deductive one, starting from the general international context of the growth of Neuroscience in contemporary times and addressing the advances in brain imaging and neuromodulation technologies, so as to arrive at the particular question, namely: can such technologies bring about ethical impacts on consciousness, personal identity, autonomy, privacy, and responsibility? Three specific objectives are proposed: first, to present the concept of Neuroscience and some of the new brain technologies, especially imaging and neuromodulation; next, the second idea is to point out the possible ethical implications of the technologies set out in chapter two. Finally, the third objective seeks, based on the ethical implications indicated, to reflect, at least minimally, on the possibility of neurorights and concepts pertaining to the legal sphere, such as consciousness, personal identity, autonomy, privacy, and criminal responsibility. This study is relevant and justifiable because, on a broad scale, it discusses the ethical and legal limits of technological intervention in the human mind. In conclusion, for the authors presented, the technologies described may impact consciousness, personal identity, autonomy, privacy, and responsibility. This is because, according to these authors, there may be a risk of neural surveillance and editing influencing individual and collective decisions. Thus, one possible path is to reflect on the new ethical and regulatory frameworks now emerging with respect to neurorights.

autonomia, privacidade e responsabilidade? Tencionam-se três objetivos específicos, quais sejam, primeiro: apresentar o conceito de Neurociência e algumas das novas tecnologias cerebrais, especialmente de imagem e neuromodulação; na sequência, a segunda ideia é: apontar as possíveis implicações éticas das tecnologias explicitadas no capítulo dois. Por fim, no terceiro objetivo pretende-se a partir das implicações éticas indicadas refletir, minimamente, acerca da possibilidade dos neurodireitos e conceitos afetos à esfera jurídica como consciência, identidade pessoal, autonomia, privacidade e responsabilidade penal. Esse estudo é relevante e justificável, pois, em escala ampla, discute os limites éticos e jurídicos da intervenção da tecnologia na mente humana. Ao final, conclui-se que para os autores apresentados as tecnologias explicitadas podem impactar na consciência, identidade pessoal, autonomia, privacidade e responsabilidade. Isto porque para os últimos pode haver risco de vigilância e edição neural influenciando as decisões individuais e coletivas. Assim, um caminho possível é refletir acerca dos novos marcos éticos e regulatórios que estão despontando sobre os neurodireitos.

1 INTRODUCTION

Considering the advances in Neuroscience, artificial intelligence and the growth of Neurotechnologies (NTs), the general objective of this work is to understand the ethical implications of neurotechnologies, especially those of neuromodulation and brain imaging, since these two have been the most widespread and present satisfactory results for the diagnosis and treatment of neurological and psychiatric diseases. As for the time frame, considering the advances in brain technologies, the technological interval should be the last twenty years in order to ensure scientific currency.

It will be developed through bibliographic research, and the method of approach adopted will be the deductive one, starting from the general international context of the growth of Neuroscience in contemporary times, addressing the advances in brain imaging and neuromodulation technologies so as to arrive at the particular question, namely: can such technologies bring ethical impacts to consciousness, personal identity, autonomy, privacy, and responsibility?

Furthermore, as to the methodology, during the preparation of this work the author declares that she used the Gemini tool (version 2.5 Flash, by Google) in December 2025 to assist with translation, textual fluidity, and formatting in accordance with the standards of the ABNT (Brazilian Association of Technical Standards). All generated content was rigorously reviewed and validated by the author, who assumes responsibility for all published content.

As for the research sources, the intention is to use academic articles, the Universal Declaration on Bioethics and Human Rights, as well as documents from international bodies such as the United Nations Educational, Scientific and Cultural Organization (UNESCO) and the Organization for Economic Co-operation and Development (OECD). In this field, given the interdisciplinary nature of the issue, it should be emphasized that the perspective will not be only ethical or legal; mention is also made of the sciences related to the theme, such as Medicine, Psychology, Engineering, and Information Technology.

In the development, three specific objectives are intended, namely, first: to present the concept of Neuroscience and some of the new brain technologies, especially imaging and neuromodulation; next, the second idea is: to point out the possible ethical implications of the technologies set out in chapter two. Finally, in the third objective the aim is, based on the indicated ethical implications, to reflect, at least minimally, on the possibility of neurorights and concepts pertaining to the legal sphere, such as consciousness, personal identity, autonomy, privacy, and criminal responsibility.

In light of the above, the following topics are proposed: introduction; chapter two: Neuroscience and new brain technologies; chapter three: ethical implications of imaging and

neuromodulation technologies and chapter four: new dimensions in the concepts of consciousness, identity, autonomy, privacy, and responsibility; and, finally, the final considerations.

The hypothesis proposed in this work is that, yes, the new technologies addressed in the text may impact the contours of the concepts pertaining to the legal prism, namely: consciousness, personal identity, autonomy, privacy, and responsibility, since there is the possibility of mapping neural data which, taken together, are capable of helping to identify patterns of thought, thus allowing certain actions to be individually or collectively encouraged or discouraged depending on the controller's objective. It is in this field that scholars have addressed mental privacy, cognitive liberty, and the protection of neural data as specific rights: neurorights, a concept to be explored in the development of this work.

Above all, studies to be presented in due course in this research indicate that emotions and behaviors can be altered by new technologies, generating a personality distinct from the one the individual had before clinical intervention. This matters, above all, because of the expansion of access to such technologies and the possibility of their use in non-therapeutic or non-clinical contexts. In this sense, an individual who undergoes a change in personality may suffer a loss of identity, affecting self-perception and engendering an estrangement from oneself, impacting personal identity and autonomy.

In light of the above, this study is relevant and justifiable because, in general, it discusses the ethical limits and legal impacts of neurotechnological intervention in the human mind, as well as projecting a discussion for the coming years that must traverse the idea of neurorights, and of what will be considered cognitive enhancement and what will be therapeutic.

In the end, it is concluded that the technologies set out may impact the ethical-legal sphere of consciousness, personal identity, autonomy, privacy, and responsibility. This is because there is a risk of neural surveillance and editing influencing individual and collective decisions. In this sphere, the path is to reflect on the new ethical and regulatory frameworks that are emerging regarding the contemporary limits of Neuroscience and brain technologies.

2 NEUROSCIENCE AND NEW BRAIN TECHNOLOGIES

In January 2024, The New York Times announced brain implants: *“Neuralink Implanted a Device in a Patient’s Brain, Elon Musk Says: The billionaire Said his company’s first product, called Telepathy, would let a person control a phone or computer “just by thinking”* .(Mac, 2024).

The Neuralink experiment prompted social reflections, especially because, according to Waisberg, there was low transparency regarding the way the experiment was carried out, the long-term effects of the implant, as well as the surgical risks, since the procedure of implanting or removing a chip from the brain is invasive. The use of this type of device also prompted reflections regarding the control and privacy of neural data which could be extracted from this device, in addition to stimulating discussions about the ethical limits of clinical or non-clinical interventions in brain activity. (Waisberg, 2024)

In addition, the last author highlights the need for robust informed consent, as well as the possibility that these technologies may deepen social inequalities, since it cannot be determined whether they would be available to everyone or whether they would be marketed at a high price as cognitive enhancement, besides engendering debate about users' consent, clarifying that such techniques are invasive and require the migration of wires within brain tissue. (Waisberg, 2024)

In January 2025, The Lancet Neurology announced the most relevant research in Neuroscience of 2024, among them the advances in blood biomarkers and brain omics. This important record made explicit the ability to detect proteins associated with Alzheimer's early, constituting an advance in the diagnosis of this disease, surpassing imaging exams and biopsies. (Fu; Ip, 2025).

One of the phenomena most studied by Neuroscience is the search for an understanding of consciousness; questions such as where it derives from remain a subject of investigation and disagreement among neuroscientists. Studies suggest that it would result from the integration of distinct parts of the brain; Koch stated in 2025 that it derives from the posterior cortex. This study monitored the brains of 256 participants in real time using brain-measurement techniques. Above all, it attempted to demonstrate how information is unified and integrated by the brain, generating new contours for studies in artificial intelligence and biology (Karel, 2025).

The contemporary structure and understanding of the concept of consciousness is a source of debate, especially due to the development of artificial intelligence (AI) systems. This is because the consciousness or non-consciousness of AIs has been frequently questioned. Topics such as “The artificial intelligence robot that became a millionaire with cryptocurrencies and now wants to be recognized as a person” pervade the news. (Walker, 2025)

The discussion is latent considering the growing impact of language models capable of simulating human conversations fluently. That is, can this new way of “conversing” (simulating?) be regarded as consciousness, since it stems from an artificial process? It is

still early to answer this and other questions raised throughout this text; however, there is a certain urgency in defining markers to detect where consciousness arises. Such identification makes it possible to develop treatments for neurological diseases, to identify vegetative states or coma, in addition to speculating on a central question of contemporary times, which ponders whether AI machines can develop consciousness and subjectivity.

In this panorama, in May 2025, BBC NEWS asked “*Can artificial intelligence already be conscious? What scientists say*”. The text reflects that recent research investigates consciousness in experiments such as the dream machine. According to Ghosh, experts believe that some AI systems may soon become conscious as they acquire greater processing and sensory information. On the other hand, there are those who argue that true consciousness could arise only in living systems characterized by biological life. (Ghosh, 2025)

Another study investigated the definition of the moment of death and raised social debates. In 2024, G1 announced “A neuroscientist's discoveries about what happens in the brain while we die”. (Rodriguez, 2024). Through the use of electroencephalography (EEG), this research helped to explore the idea that perhaps the brain does not stop immediately after cardiac arrest. The authors indicate findings suggesting that the brain enters a kind of survival mode when deprived of oxygen, thus closing communication with the exterior to focus on internal processes of the body itself, intensely synchronizing the neural networks.

Although it is an incomplete study, it may give rise to ethical reflections, for example, regarding the moment of switching off devices in order to avoid residual suffering, prompting future revisions about the criteria of brain death, in addition to impacting the techniques and the appropriate moment for resuscitating people. (Xu *et al.* , 2023)

The question of consciousness set out above sets neuroscientists against one another, but it was raised to reveal the debate within the Neurosciences and how it is interconnected with new technologies, such as those of brain imaging or artificial intelligence. After presenting these contemporary debates about the new technologies that are connected to the multidisciplinary field in question, the next point is to define what can be understood as Neuroscience and as Neurotechnologies.

Neuroscience is a multidisciplinary field that studies the nervous system; thus, areas such as Medicine, Biology, Psychology, Engineering, and Philosophy come together to think about the brain and how it generates thoughts, actions, emotions, memories, languages, chemical reactions, the functioning of organs, among other possibilities. Especially in recent years, the use of computing and AI to try to replicate human brain processes is frequent, and for this reason Neuroscience, which is able to unite these various branches of knowledge,

gains prominence, since it also seeks to understand brain functioning. Below, some concepts relevant to the present research will be explored, and for this reason some direct quotations are necessary.

In summary, considering the importance of Neuroscience for the present work, it is clarified how this field of knowledge can operate

Neuroscience is the field of knowledge that studies the nervous system, including the structure, function, development, genetics, evolution, and pathology of the nervous system and the brain. It combines several disciplines, including biology, psychology, chemistry, physics, mathematics, and computer science, to understand how the nervous system functions at the molecular, cellular, systemic, and behavioral levels. Neuroscientists employ a variety of techniques, such as neuroimaging (such as functional magnetic resonance imaging and electroencephalography), animal studies (such as rodents and non-human primates), molecular and cellular biology techniques, computational modeling, and clinical studies in humans to investigate questions related to the brain and the nervous system. The goals of Neuroscience are vast and include understanding the neural basis of behavior, emotions, cognition, memory, learning, perception, sleep, movement, and much more. In addition, Neuroscience has applications in a wide range of areas, including medicine (to understand and treat neurological and psychiatric disorders), artificial intelligence (to develop intelligent systems inspired by the brain), and even in fields such as economics and law (to understand how the brain influences human behavior). (Santos and Coutinho, 2024)

Still in the conceptual sphere, Neuroscience, when forming a multidisciplinary trio with artificial intelligence and engineering, may seek to translate biological signals into digital commands and has, in this case, been called Neurotechnology. Although there is no consensus regarding the concept of neurotechnologies, use is made of the extensive paragraph from the National Data Protection Authority (ANPD) on the subject, as it connects various international bodies in a synthetic manner

The OECD (2019, p. 6, our translation) defines neurotechnologies as the “[...] devices and procedures used to access, monitor, investigate, assess, manipulate and/or emulate the structure and function of the neural systems of natural persons”. The same conceptualization is adopted by the International Bioethics Committee of UNESCO (2022, p. 13), which incorporates into its definition of neurotechnologies the actions of devices and procedures on the neural systems of animals. Neurotechnologies refer to a range of methods and tools for interacting with the brain and the nervous system, with this interaction occurring either passively, to monitor brain activity, or actively, to alter it (Andorno, 2023, p. 12). In turn, the ICO (2023, p. 8, our translation) conceptualizes neurotechnologies as the “[...] consumer, business, and health devices and procedures, both invasive and non-invasive, that directly record and process neurodata for the purpose of collecting data, controlling interfaces or devices, or modulating neural activity”. The UN (2024, p. 2, our translation), through a report of the Advisory Committee of the Human Rights Council, highlights that “the term ‘neurotechnologies’ encompasses a range of devices and systems that interact with the central nervous system by electrical, magnetic, optogenetic² and other means”.

Such devices may assist in understanding how the brain functions, or may also intervene in the processes of the nervous system aiming to recover functions or enhance capacities (UN, 2024, p. 2). For Bertoni and Ienca (2024, p. 2), neurotechnology should be understood as a broad concept that encompasses devices, tools, systems, and algorithms aimed at understanding, influencing, accessing, monitoring, assessing, emulating, simulating, or modulating the structure, activity, and functioning of the nervous systems of human beings and other animals. This definition, when compared with the others above, presents greater specificity and coverage regarding the purpose of the use of neurotechnologies, as well as incorporating algorithms as an integral part of the spectrum of neurotechnologies. **Neurotechnologies enable the establishment of a direct connection between the brain and devices external to it, and this gives them a singularity that requires attention to the ethical-legal repercussions, since this type of connection can permit interventions in brain activities** (UN, 2024, p. 2) (Brazil, 2025, emphasis added)

In the last decade, the rapid advance of these three fields of knowledge has been able to redefine, reinterpret, and manipulate the way the human brain operates. The ability to observe neural activity in real time has allowed an increasingly precise understanding of human brain activity and, therefore, of the individual and collective behaviors of this group.

Simultaneously with this scientific development, other methods of brain analysis have also drawn attention: neuromodulation. The latter makes it possible to directly access and render controllable the dynamics of the brain system and, for this reason, has been applied in clinical and experimental research. Having introduced the concepts and considering the direct interventional capacity in the brain, added to the growth of external devices (chips, glasses, helmets, and headphones) that connect to that organ through brain-machine interfaces, in this work it was chosen to focus in particular on the most emerging modulation and image-monitoring neurotechnologies: the so-called neuroimaging and neuromodulation, also touching on brain-machine interfaces, which will be set out in chapter three, below.

2.1 BRAIN IMAGING TECHNOLOGIES (NEUROIMAGING) AND NEUROMODULATION

Neurotechnology for this work can be understood as the set of techniques and tools that unites distinct sciences and makes it possible to record, investigate, and alter an activity, and may serve distinct applications which will be illustrated in this chapter. The OECD highlighted neurotechnologies as one of the emerging technologies, along with synthetic biology and artificial intelligence. This is because, according to the same organization, they “are characterised by rapid development and uncertainty in trajectory and impact.” (OECD, 2025)

In November 2025, UOL ran the headline “Neurotechnology revolution turns science fiction into reality”. According to the text, direct communication with the brain, aiming at the

restoration of movement in paralyzed individuals and turning thoughts into words, are capabilities of neurotechnologies. The rise of this type of instrument can be frightening, especially because it raises ethical questions regarding the use and social impact of these technologies. (Agence France-Presse, 2025).

The growth of neuroimaging changed the way scientists study the human brain; this observation procedure makes it possible to see the complex functioning of this organ. Next, neuroimaging and its associated technique, namely the brain-computer interface (BCI), will be explored.

2.1.2 Brain imaging technologies and brain-computer interfaces

Among the neuroimaging technologies, functional magnetic resonance imaging (fMRI), electroencephalography (EEG), and positron emission tomography (PET) stand out². Each one has its particularities: fMRI can map areas of brain activity that correlate with motor, sensory, or cognitive functions; it is a kind of photograph of the structure; PET, on the other hand, can assist in visualizing other processes, for example neurochemical ones, that is, it assesses brain metabolic activity based on the emission of positrons, while EEG can serve to capture brain electrical activity synchronously, through electrodes on the scalp, monitoring the electrical activity so that the brain rhythms recorded in graphs can be assessed.

The combination of these technologies is capable of serving to understand cognitive, emotional, and behavioral neural bases. In this way, it supports research in important areas, such as psychiatry and neurology, in addition to contributing to clinical diagnosis. Below, these three neuroimaging techniques will be highlighted. Beginning with fMRI, Meneses *et al* point out that

Functional magnetic resonance imaging (fMRI) is a new technique capable of detecting small changes in blood flow and oxygenation of brain tissues where neuronal activation occurs. Its use in the pre-surgical evaluation of patients with epilepsy who have temporal mesial sclerosis is currently under evaluation at some neurology centers. The main objective is to find the best activation paradigm in the evaluation of language and memory functions, aiming to replace the Wada test, widely used nowadays. ((Meneses *et al* ., 2004)

As for EEG, in this technique electrodes are placed on the scalp and the captured signals are converted into digital data; it monitors the electrical activity so that the brain rhythms recorded in graphs can be assessed. The analysis of such rhythms makes it possible

² Positron Emission Tomography, from the English

to identify excessive electrical impulses which point to a predisposition to epilepsy or a seizure, for example. According to Zhang *et al* it “is a non-invasive measurement method for brain activity. Owing to its safety, high resolution, and hypersensitivity to dynamic changes in brain neural signals, EEG has aroused much interest in scientific research and medical fields.”. (Zhang *et al* ., 2023)

PET, in turn, can identify tiny tumors that the techniques previously presented here would not be able to. It also makes it possible to assess the response to chemotherapy treatment, for example, whether the cells remain diseased, in metastasis, or whether they have stopped progressing. Because it is a non-invasive technique, capable of analyzing the whole body in a single exam, it is widely used for the diagnosis of diseases, especially in oncological, cardiovascular, and neurological practice, as Vaquero and Kinahan point out

Of all the tomographic molecular imaging modalities, positron emission tomography (PET) probably offers more translational possibilities than any other modality, owing to its combination of sensitivity and quantitative accuracy. PET is a non-invasive imaging modality that provides physiological information through the injection of radioactive compounds (radiotracers), detection of the radiation, and reconstruction of the radiotracer distribution. PET imaging has evolved from an imaging modality used for research into a standard component of diagnosis and staging in oncology; it is also used for specific neurological and cardiovascular indications. This is due to the clinically useful information it provides about the function and state of tissues and organs, through the use of radiolabeled molecular imaging agents. (Vaquero and Kinahan, 2015)

However, the sophistication of these brain imaging technologies, as well as the capacity for technical intervention in brain circuits, whether for therapeutic purposes or not, concerns scholars, and it is precisely for this reason that this work is justified by the risks and ethical implications associated with the uncertain and historically unprecedented use of this type of instrument. The integration of these techniques of brain reading and assessment, associated with the possibility of modulating emotions and therefore also of altering behaviors, reveals the relevance of the contemporary debates pertaining to the subject of this subchapter.

The possibility of influencing behavioral dynamics in real time gave rise to research highlighting the implications of the techniques under discussion. In this sphere, brain-computer interfaces have also become more sophisticated so as to be able to operate simultaneously with these techniques. Below, what these interfaces are is set out, and then some risks associated with the technologies in question are mentioned.

BCIs emerge to establish communication between brain activity recorded by neuroimaging and translated into external devices. “Brain-computer interfaces (BCIs) use

brain signals to gather information about the user's intentions. To do this, BCIs rely on a recording stage that measures brain activity and translates the information into interpretable electrical signals.”, explain Nicolas-Alonso and Gomez-Gil. (Nicolas-Alonso and Gomez-Gil, 2012)

According to Burwell, Sample, and Racine, there is no consensus on the definition of the brain-computer interface, but it is an area undergoing abrupt development in Neuroscience. The authors state that

(...) there are some elements on which researchers and scholars commonly agree. These crucial elements are the capacity of a BCI to (1) detect brain activity directly, (2) provide feedback in real or near-real time, (3) classify brain activity, and (4) provide feedback to the user reflecting whether he/she has successfully reached a goal [10]. Similar to most authors [9], we consider a BCI to be a device that detects brain signals conveying intention and translates them into machine-executable output [11]. In other words, it is a direct connection “between living neuronal tissue and artificial devices that establishes a non-muscular communication pathway between a computer and a brain” [12]. BCIs have potential of great significance in patients' daily lives [13]. For example, BCIs ³can be used as “spellers” for individuals who have no other way to communicate [12, 14,15,16,17,18], can give people who are locked in or paralyzed some control over their environment [12, 15, 19,20,21,22,23,24], and may be able to assist rehabilitation after spinal cord injury via artificial stimulation of the muscles [11, 24], among other potential applications. (Burwell, Sample, and Racine, 2017)

To clarify the function of BCIs, Nicolas-Alonso and Gomez-Gil add

A brain-computer interface (BCI) is a hardware and software communication system that allows brain activity alone to control computers or external devices. The immediate goal of BCI research is to provide communication capabilities to people with severe disabilities, such as total paralysis or those “locked in” by neuromuscular disorders such as amyotrophic lateral sclerosis, brainstem stroke, or spinal cord injury. (Nicolas-Alonso and Gomez-Gil, 2012)

Still, in the same sphere, classic examples of BCIs are: the p300Speller, although its accuracy is considered low according to Nicolas-Alonso and Gomez-Gil, is an EEG-based communication system which was designed to allow severely paralyzed patients to select letters on a screen using only brain activity in order to communicate with other people (Nicolas-Alonso and Gomez-Gil, 2012).

Another example is neuroprostheses, which can control robotic upper limbs via mental activity. There are also specific systems that can control wheelchairs or drones through brain activity. Although they are not the object of this work, it is worth highlighting how motor

³From the English, Brain Computer Interface (BCI), or brain-computer interface

neuroprostheses work, with a view to understanding their real potential to promote health and well-being in certain individuals

(...) there is a method of activating neural structures by means of an FES system ⁴that facilitates a specific movement and allows its use in the real context in which people live; these are the so-called Neuroprostheses or Motor Neuroprostheses (MN) (MENDES *et al.* , 2020). A neuroprosthesis for grasping, for example, is an FES system that restores the ability to grasp objects; and there are neuroprostheses with diverse objectives, for standing, walking, reaching, etc. (MARQUEZ-CHIN; POPOVIC, 2020). MNs are devices developed to assist in the restoration of motor functions and in performing a lost function. They **have an interface with the nervous system stimulating muscles, nerves, spinal cord, or brain and are being used daily to increase the activities and participation of people with impairments** (COLLINGER *et al.* , 2013). The MN has a typical architecture composed of **sensors to capture the user's command intention or automatic control of the stimulation, a control unit (controller), a stimulator, and electrodes that distribute the stimulation; making possible an autonomous operation** during the performance of functional activities, (...) (GIL-CASTILLO *et al.* , 2020; MARQUEZ-CHIN; POPOVIC, 2020; MENDES *et al.* , 2020). (Lopes, 2021)

The potential of BCIs is promising, especially for use in communication and in paralysis, in addition to use for entertainment. In this sphere, according to the OECD, they can promote health and well-being for individuals with disabilities or in rehabilitation. (García and Winickoff, 2022)

Thus, it does not seem appropriate to halt this type of instrument given its capacity to promote well-being, but neither can the risks associated with the sophistication of some technologies be neglected, as will be explored in the chapter that follows. The point here was to present the functioning of the classic BCIs. Having outlined the panorama, concept, and application of BCIs, which can operate together with neuroimaging, the focus turns below to the other technology with the capacity to intervene directly in the brain: neuromodulation.

2.1.3 Neuromodulation

Still in the context of Neuroscience and the technologies related to it with human interventional capacity, neuromodulation also stands out, because it can be key to direct intervention in neural circuits. According to Pancholi *et al.* , 2025, it is a “medical field focused on altering nervous activity by means of specific stimuli.” (Pancholi *et al.* , 2025).

The technology in question is not to be confused with neuroimaging or with BCIs; the former have the capacity to observe brain activity, while the interfaces translate such movement to some external apparatus. On the other hand, neuromodulation acts on

⁴ Functional Electrical Stimulation (FES)

neurodynamics, that is, an electrical, chemical, magnetic, or optical stimulus is applied directly to a specific area of the brain aiming to alter the connection between neurons. Such an alteration may be transient or permanent depending on the stimulation.

Marder explains that neuromodulation can modify intrinsic properties of neurons, that is, it reconfigures neuronal circuits and this can significantly alter the output of these circuits. This matters because, according to the author, all nervous systems are subject to being neuromodulated, and depending on the intensity and frequency they can build functional circuits that will give rise to a particular behavior. She reflects on whether the action of the modulator can be robust and predictable considering the variability among animals or among neurons, further questioning whether the procedure is reliable across individuals since each one may have a nervous system with different patterns. (Marder, 2012)

In a study on long-term neuromodulation, Palacios-Filardo and Mellor indicated that neuromodulators such as dopamine, serotonin, and noradrenaline, when released, can facilitate long-term synaptic plasticity, that is, the brain could reprogram and modify its connections between neurons in response to a given stimulus. In this way, a connection could be strengthened or weakened. (Palacios-Filardo and Mellor, 2018)

Through long-term potentiation (LTP), in which after repeated and intense stimulation the connection between neurons can be strengthened. Whereas, in long-term depression (LTD) the connection between certain synapses may be little used, discouraged, and therefore weakened, since the brain, to avoid its saturation, discards the irrelevant. The authors indicated evidence that each of these neuromodulators can trigger mechanisms that facilitate long-term potentiation or depression (Palacios-Filardo and Mellor, 2018).

Although the complexity of the subject is indisputable, an attempt is made to translate in a simple way how potentiation works: when a new skill is stimulated repeatedly, a neuron sends a signal to the others; such repetition strengthens learning so that later, in the future, even a weak stimulus produces a quick response, and for this reason it is not necessary, for example, to relearn how to ride a bicycle: once the connection has been learned and already potentiated, it is recognized.

And it is precisely this capacity to affect behavioral mechanisms through repetition, creating memory and the learning of behaviors, that is concerning and justifies this chapter of the work; above all, if used in a non-therapeutic context, it may have uncertain ethical consequences.

The foundation of this technology is the idea that many psychiatric or neurological disorders derive from some activity, whether electrical or chemical, but one that is considered abnormal within a specific neural circuit. (Pancholi *et al* ., 2025).

To clarify, Neudorfer *et al* explain that in an experiment of deep brain stimulation to treat essential tremor disease, the focus was on the thymic targets within a particular nucleus and a particular brain area. Next, they discussed the historical bases for the selection of these targets. The point is that they integrated imaging and electrophysiological techniques to improve the precision of the chosen target and presented indications that such accuracy in target targeting yielded a superior result in suppressing the tremors of that disease. (Neudorfer *et al* ., 2024)

Pancholi *et al* . also explain that within this medical field there are: invasive techniques, for example, deep brain stimulation, responsive neurostimulation, vagus nerve stimulation, and spinal cord stimulation; and non-invasive ones which can be, also by way of example, transcranial magnetic stimulation, focused ultrasound, and transcranial direct current stimulation. (Pancholi *et al* ., 2025). However, Krishna and Fasano explain that this list of techniques is not exhaustive and is constantly expanding, and they mention that “treatments such as deep brain stimulation (DBS) are now adopted in almost every country worldwide, with a steady growth in the number of implanted patients.” (Krishna and Fasano, 2024)

There is no intention to detail how neuromodulation can act on neurological and psychiatric disorders, but the point is that among the most cited non-invasive procedures are transcranial magnetic stimulation and electrical stimulation, techniques which offer precise adjustments in stimulation and have provided greater safety when compared to invasive approaches, since they avoid surgery, as Camacho-Conde *et al* .:

Brain stimulation involves the passage of electrical currents to brain cells in the cortical and subcortical area to modulate brain functions and is carried out by two methods: non-invasive and invasive. Technological advances have contributed to the development of various techniques within both categories (see Box 1) (S). Non-invasive stimulation is carried out using two distinct techniques: transcranial magnetic stimulation (TMS), introduced in 1985, 2 (2) and transcranial electrostimulation (TES), in clinical use since 1801. 3 (s) However, currently, the most widely used form of TMS is repetitive TMS (rTMS) and of TES is transcranial direct current stimulation (tDCS). Non-invasive brain stimulation techniques use electrical currents applied directly through magnetic fields or electrodes on the patients' scalp to stimulate cortical brain cells, while invasive stimulation, such as deep brain stimulation (DBS), involves the passage of electrical currents to brain cells in the subcortical area through electrodes implanted surgically more deeply in the brain. Unlike the invasive ones, the non-invasive methods do not require anesthesia and surgical operation and, therefore, are preferred over invasive methods. In the last decade, the use of these brain stimulation methods has not only increased substantially but has also expanded to a wide variety of brain disorders, including schizophrenia, major depressive disorder, anxiety disorders, and cognitive dysfunctions. (Camacho-Conde *et al* ., 2022)

Neuromodulation has been explored in the treatment of psychiatric disorders such as addictions, obsessive-compulsive disorder (OCD), and depression; although for the most part these are experimental treatments, there are already neuromodulation options approved by the FDA for the latter two disorders, as Ranjan, Mahoney, and Rezai clarify

With insights from the neurocircuitry of psychiatric disorders and extensive experience of neuromodulation with deep brain stimulation (DBS) in movement disorders, DBS is increasingly being considered a modulator of the neural network in psychiatric disorders. (...). The FDA (United States Food and Drug Administration) has approved the indication of DBS for psychiatric disorders. Medically refractory depression, addiction, and other psychiatric disorders are being explored for DBS neuromodulation. Studies evaluating DBS for psychiatric disorders are promising but lack larger, controlled studies. (...). We also present a brief review of MR-guided Focused Ultrasound (MRgFUS), a new form of neurosurgical neuromodulation, which can reach deep subcortical structures similar to DBS, but in a non-invasive way. The early experiences of neurosurgical neuromodulatory therapies, including MRgFUS neuromodulation, are encouraging in psychiatric disorders; however, they remain investigational. Currently, DBS and VNS are the only neurosurgical neuromodulation options approved by the FDA in appropriately selected cases of OCD and depression, respectively. (Ranjan, Mahoney, and Rezai, 2024)

Furthermore, regarding the possibilities of using neurostimulation, Gouveia *et al* point out its use in the treatment of drug-resistant epilepsy and indicate vagus nerve stimulation and responsive neurostimulation as procedures that have been used. Although the former is the most accessible, including being approved by the FDA for children, the responsive route and deep brain stimulation have been promising in cases of drug-resistant seizures, since there was a reduction in the frequency of seizures, according to those authors. (Gouveia *et al* ., 2024).

In summary, what was intended to be demonstrated in subsection 2.1 is that the integration of neuroimaging neurotechnologies, added to the possibility of neuromodulation practices, has driven clinical and therapeutic practices as well as emerging research. Such a combination of techniques allows researchers to monitor in real time the changes in brain activity, deepening the understanding of how the brain system functions. From such knowledge it is possible to identify markers that guide early diagnosis or the personalization of medical treatments. For this reason, neurotechnologies are promising in correlating Neuroscience, technologies, and clinical practices. However, these experiments come accompanied by many ethical questions, since they act directly on human cognition with the capacity for behavioral modification, whether for its enhancement or its weakening.

Finally, despite all these benefits in the treatment and diagnosis of the most diverse diseases, the impacts of the use of these technologies are still uncertain, especially

considering, for example, that the latest technologies, such as *smartphones* became popular in less than two decades. Thus, concerned with this rapid advance, scholars from distinct fields of knowledge are concerned with these implications, a subject which will be addressed next, especially from an ethical point of view.

3 ETHICAL IMPLICATIONS OF IMAGING AND NEUROMODULATION TECHNOLOGIES

The contribution of Neuroscience to the research, treatment, and diagnosis of some diseases is incontestable, as was attempted to be shown in chapter two. Specifically, when one considers the number of people who are affected by psychiatric disorders and who do not respond to treatment, which increases the risk of suicide and death of these individuals. Such an occurrence reveals that techniques such as neuromodulation seem socially desirable.

Likewise, the hypothesis that individuals with movement disorders such as Parkinson's and essential tremor, or even the possibility of paralyzed individuals regaining some control over their activities, are ideals that are highly esteemed, as Whitten argues

The sophisticated methods of Neuroscience — including molecular genetics, structural and functional neuroimaging, animal models, and experimental tasks that simulate real-world behaviors in human research — have provided important insights into typical functioning and neurobehavioral disorders. Translational Neuroscience seeks to use this knowledge to improve the human condition, developing and refining interventions for these disorders. (Whitten, 2012)

Mental disorders, according to Camacho-Conde *et al* are prevalent in all communities, and depressive disorders rank third in the global burden of disease. Even in middle- and high-income countries, with suicide being the third leading cause of death among groups aged 15 to 24 and the fourth among those aged 18 to 65, and according to the authors, since medications and other treatments are not always effective, there has been in recent years interest in the application of brain stimulation to try to address this issue. (Camacho-Conde *et al* ., 2022)

The idea of alleviating the suffering of these distinct groups is esteemed; however, such a contemporary context, which brings together various fields of knowledge, distinct technologies, and techniques added to artificial intelligence, and which seems quite promising in the diagnosis and treatment of diseases, has gained momentum, especially because of the speed with which some methods can advance, and gives rise to disquiet both socially and academically. The intriguing social debate can be visited through the New York Times article of November 2025, the article “*Big Tech Wants Direct Access to Our Brains:As*

neural implant technology and A.I. advance at breakneck speeds, do we need a new set of rights to protect our most intimate data — our minds?” (Kinstler, 2025)

The title of the aforementioned text was highlighted here because it serves to evidence the social clamor on the issue, since it also addresses the access that technology companies may have to what goes on in the intimacy of human minds and how this could be used by large companies to track emotions and energy levels, and warns of the risk of mind control and behavioral manipulation that could be employed on a large scale. Hypothetically, it reflects on what could happen if an EEG signal were capable of identifying political ideology, lying, or sexual orientation. (Kinstler, 2025)

Neural data can offer unparalleled insight into the workings of the human mind. B.C.I.s are already frighteningly powerful: Using artificial intelligence, scientists have used B.C.I.s to decode “imagined speech,” constructing words and sentences from neural data; to recreate mental images (a process known as brain-to-image decoding); and to trace emotions and energy levels. B.C.I.s have allowed people with locked-in syndrome, who cannot move or speak, to communicate with their families and caregivers and even play video games. Scientists have experimented with using neural data from fM.R.I. imaging and EEG signals to detect sexual orientation, political ideology and deception, to name just a few examples. (Kinstler, 2025)

The political and scientific community has also reflected on mental privacy, control of neural data, cognitive liberty, and related rights, which, on a broad scale, aim to protect mental integrity, and which the literature has termed *neurorights*. In 2024, the European Parliament addressed the subject of the ethical challenges regarding the protection of mental privacy in the area of Neuroscience, whose title also deserves mention because *it touches on part of the reflection intended to be proposed in this chapter The protection of mental privacy in the area of neuroscience: Societal, legal and ethical challenges*. (Maia de Oliveira Wood *et al* ., 2024)

The last text states that, as a result of this debate and to generate social visibility for the subject, the *Neurorights Foundation* was created, which aims to discuss and assess the proposal of *neurorights*. The authors question the bases that underpin such rights and make explicit that caution is necessary on the subject, especially because it centers its theory on the idea that the human self originates in the brain (although this explanation is quite accepted by the academy), which can reduce the human to neural data, engendering a certain objectification of the individual. (Maia de Oliveira Wood *et al* ., 2024)

This last perspective is also debated because it touches on the notion of the human dignity of the vulnerable (for example, patients in a coma or with cognitive disabilities), a value that is central in civilized societies. According to the text, although the consequences are

unintentional, and the social and collateral effects are not fully known, one of the greatest issues concerns the pressure for the individual to adapt to performance levels that are attainable only through invasive interventions. (Maia de Oliveira Wood *et al.* , 2024)

The text concludes with a critical analysis, mentioning that converting moral rights into legal rights deserves reflection and that they do not always need to be enshrined in positive law. That is, it questions whether more legislation is necessary or whether existing rights would be sufficient to protect concepts such as freedom of thought, mental integrity, and privacy. The authors consider whether these traditional rights, with a historical basis, could also protect against manipulations in the cognitive sphere. (Maia de Oliveira Wood *et al.* , 2024)

The concern with the neural sphere occurs, according to Chneiweiss, because neurotechnologies are not yet manufactured commercially on a large scale, but this should not take long, and he warns that it may be too late to act. (Chneiweiss, 2025)

Below, some ethical risks will be clarified which are also connected to technical risks of these neurotechnologies. Marder explains that it is complicated to answer the question of whether the action of a modulator is predictable as well as robust, and draws a parallel with medications, which produce distinct responses in a small group of people:

The answer to this question is complicated. First, even for modulators that have robust actions, there may be significant differences in their responses to threshold concentrations (Weimann *et al.* , 1997) (S). Second, many modulators show state-dependent actions (Nusbaum and Marder, 1989b; Szabo *et al.* , 2011), such that the prior activity or activity history of the network determines the extent or sign (Spitzer *et al.* , 2008) of modulatory action. Third, the action of the modulator can depend critically on other modulators (Brezina, 2010; Dickinson *et al.* , 1997) (S). That said, many networks with different underlying parameters can respond reliably to the same modulators (Grashow *et al.* , 2009), although in this study a small proportion of networks responded anomalously (Grashow *et al.* , 2009) (S). These data are reminiscent of what we see in the human population with pharmacological agents that produce anomalous responses in a small subset of people. Thus, although there are significant individual differences in circuit structures among individuals, the particular sets of network parameters found in the healthy population may be enriched for parameter sets that allow reliable neuromodulatory control under most conditions. (Marder, 2012)

The last quotation also clarifies why this procedure should still be viewed with caution, specifically because one cannot disregard individual differences when altering the structure of a neural circuit. (Marder, 2012)

In the same vein, Waisberg details the technical risks of this type of technology; he specifically addresses Neuralink. According to the author, these risks include: a) the displacement of the electrodes: there is the possibility that the ultra-thin electrodes will shift

or migrate to other areas of the brain, which could cause mechanical damage to brain tissue or even loss of signal from the chip; b) the retraction of the electrodes: it was reported that in the initial tests parts of the electrodes retracted from the brain tissue, so that the number of electrodes with the capacity to capture neural signals was reduced; (Waisberg, 2024)

Furthermore, there is the risk of c) Biocompatibility and inflammation: with inflammatory reactions, since the device is invasive, which can compromise the chip's effectiveness in the long term, in addition to the user's health; d) Mechanical instability: regarding this aspect, Waisberg mentions that hardware needs to maintain stable connections, but the point is that the brain system is dynamic and flexible. Thus, how to determine the durability of the polymer electrodes since they would be under continuous stress. In addition to these concerns, the last author reports the challenges of removal or even replacement, which is considered extremely risky, since it could additionally damage the cerebral cortex during surgery. (Waisberg, 2024)

Maia *et al* address specific cases from distinct points of view — ethical, sociological, and legal — and, given the completeness with which they address the subject, the text will serve as the basis for much of the argumentation that follows. They separate the ethical use of neurotechnologies into: non-invasive techniques in tetraplegic patients; non-invasive in a healthy population; invasive in a healthy population; and non-invasive in a patient with Alzheimer's. (Maia de Oliveira Wood *et al* ., 2024)

In the first case, the use of non-invasive NT in a tetraplegic patient: the pre-implant concern is transparency and informed consent, since contexts such as Neuralink's would require, according to the authors, the follow-up and monitoring of specialists in human rights and medical ethics regarding the results and methods, in addition to the implementation. As for the post-implant phase, the concern is that even in the case of success, there is a risk of pressuring the patients, in the case of an enhanced human capacity, such that society itself pressures the individual to adapt to the new “enhanced” self, engendering the ethical question between what is therapy and what is enhancement. (Maia de Oliveira Wood *et al* , 2024)

In the second case, the use of non-invasive NT in a healthy population to increase concentration, for example. The authors debate the functionalization of people, that is, reducing the individual to their productivity, which would intensify the pressure, whether individual or social, for high performance in a constant manner. From a corporate point of view this is also alarming, since it could instill in companies a demand for a highly focused and therefore more productive workforce. (Maia de Oliveira Wood *et al* , 2024)

In people with difficulty concentrating or learning, a demand for standardization could also occur, the authors suggest, in addition to the aspect of dependence on certain devices

and the companies responsible for enabling the use of a certain technology. This could result in a high social expectation for elevated and uniform performance, which does not corroborate inclusive practices. Another ethical point is in the educational context, especially involving children, whose idea of applying electric current to the developing brain over a prolonged period in smaller doses also lacks visibility. (Maia de Oliveira Wood *et al.* , 2024)

In addition, the profit aspect and investments in BCI research are also mentioned: the NT industry generates billions in annual profits and these are expected to double or triple in the next decade. (Kinstler, 2025). With the intensification of research and profits, the speed of the application of NTs on a commercial scale increases. The accelerated pace of development and investment increases the importance of the ethical discussion.

In the same field, with regard to the use of invasive NT in a healthy population, Maia de Oliveira *et al.* explain that the ethical concern is above all with agency and dependence, that is, technologies need a constant connection and are linked to data centers, engendering questions such as the processing of such neural data, whether there is a risk of bias in the processing structure itself, involuntarily, or whether the agency itself could have such an attribution of manipulation. In view of this, they draw a parallel with current technologies already in widespread use, such as smartphones, which already have as an implication: addiction to certain applications, negative effects from excessive use, and technological dependence on digital platforms. In addition, they ask how it would be possible to ensure that the greatest number of people could use such products to increase performance. If diffusion is not possible, economic and social inequality would also be threatened. (Maia de Oliveira Wood *et al.* , 2024)

And in the last case, non-invasive NT in Alzheimer's, the authors indicate that the specific targeting for this disease, whose neurotherapy promises to improve the autonomy of these patients, cannot create false expectations of recovery in their families, particularly those based on advertising or promises without scientific evidence; therefore, there would be, according to the authors, an ethical demand also for caution regarding the dissemination and therapeutic and clinical promises made to the public. (Maia de Oliveira Wood *et al.* , 2024)

In view of the ethical questions presented here, what have countries been doing in terms of legislation and ethical guidelines to prevent the implications conjectured here? Kinstler details some measures, such as neural privacy laws

To prevent this kind of mind-meddling, several nations and states have already passed neural privacy laws. In 2021, Chile amended its constitution to include explicit protections for “neurorights”; Spain adopted a nonbinding list of “digital rights” that protects individual identity, freedom and dignity from neurotechnologies. In 2023, European nations signed the Léon Declaration on neurotechnology, which prioritizes

a “rights oriented” approach to the sector. The legislatures of Mexico, Brazil and Argentina have debated similar measures. California, Colorado, Montana and Connecticut have each passed laws to protect neural data. (Kinstler, 2025)

The pertinence of the issue is so great that, while this work was being produced, UNESCO published a global normative framework on the ethics of neurotechnology aiming to anticipate major scientific advances without compromising human rights. The recommendation came into force on November 12, 2025, and expressed the following concern

Although its medical use is strictly regulated, neurotechnology remains largely unregulated in other areas. Many consumers use this technology without knowing it, through common devices such as *headbands* or connected headphones, which use neural data to monitor heart rate, stress, or sleep. This highly sensitive data can reveal thoughts, emotions, and reactions, and can be shared without consent. (UNESCO, 2025)

Finally, although the points of this chapter have raised more questions than answers, the discussion aimed to present the current debates and how the limits of application of these technologies are still not clear. The debate is broad, traversing themes such as social pressure for high performance, inequality of access, coercive use — even if implicitly, in order to be socially accepted — false expectations of recovery for some diseases, technological dependence, agency by large technology companies, security, storage, processing, and protection of neural data. And, above all, it reveals the possibility of acting directly on the brain with the capacity to influence emotions and shape behaviors.

In this way, themes related to the construction of the individual, as well as what it will mean to be a human — thinking, endowed with supposed free will — in the face of the possibility of behavioral interference arising from the new technologies explored here? Such reflection provokes debates about the understanding of the notions of consciousness, identity, autonomy, privacy, and responsibility, which pertain to the legal field, and for this reason will be conceptions explored below.

4 NEW DIMENSIONS IN THE CONCEPTS OF CONSCIOUSNESS, IDENTITY, AUTONOMY, PRIVACY, AND RESPONSIBILITY

The advance of neurotechnologies, which can intervene in cognition and decision-making, creates tensions in classic concepts such as consciousness, identity, autonomy, privacy, and responsibility. In this scenario, there is no intention to exhaust the subject, but only to investigate, at least minimally, the new configurations of the concepts in question,

since they are traditional concepts that would demand greater theoretical depth which this article did not propose to undertake. Thus, the purpose of this chapter is to reflect summarily on these new dimensions of the concepts in question that may have impacts in the legal sphere; for this reason, the doctrinal discussions have addressed the subject under the prism of the possibility of neurorights.

Burwell, Sample, and Racine carried out a review of the literature, analyzing beyond the questions raised in biomedical ethics but also seeking sources in medicine and philosophy, and identified

that research on BCI and its potential translation into therapeutic intervention generates significant ethical, legal, and social concerns, notably with respect to personality, stigma, autonomy, privacy, research ethics, safety, responsibility, and justice. Our review of the literature further determined that, although these issues have been enumerated extensively, few concrete recommendations have been expressed. (Burwell, Sample, and Racine, 2017)

If, on the one hand, NTs offer significant medical advances, their convergence with AI, added to non-medical, profit-driven, and commercial-scale contexts, points to reflection on what kind of human being we can create from brain manipulation or from neural data. In 1970, Delgado provoked "*The question is what sort of humans would we like, ideally, to construct?*" (Scarf, 1970)

Delgado was a pioneer in experiments on brain stimulation and on the *stimoceiver* (a radio device with the capacity to stimulate specific brain areas at a distance). He researched the suppression of aggressiveness and the amplification of happiness and intelligence. In 1963, he carried out an experiment with a bull to demonstrate that behaviors such as aggressiveness could be modified. He implanted a stimulator and radio receiver in the bull's brain and, by means of a certain stimulation, a signal was sent to the animal's brain, which stopped and calmed down. (Marzullo, 2017)

The possibility of physical control of the mind is still of interest, and for this reason Delgado's question, above, points to the relationship between programming and autonomy, that is, if it is possible to suppress or reduce anger or sadness by means of an implanted chip or by means of an electric shock in a brain area of a given individual, would that individual still be himself? In this case, Glannon explores this question of how to identify what the therapeutic limit is: what is it to cure a disease? He reflects on how to delimit what is: manipulation of personality; enhancement (normal functions potentiated?); and therapy. (Glannon *apud* Focquaert, 2009)

If the human being can be constructed, emotional states inferred, motor intentions and affective states altered, the technological risk and the concern of society and of scientists is legitimate, because, according to Kinstler, without due protection for the human mind: surveillance techniques could be employed, companies would have the ability to exploit the neural data generated from human thought; in addition, she conjectures the manipulation of decisions made from cognitive monitoring. The idea of the power to construct a human being, if taken over by corporations or by governments aiming at an idealized human — without flaws, or docile, or hyperproductive — has plagued philosophers, writers, and scientists for decades. (Kinstler, 2025).

In this field, reflection is made on the formation of opinion: how to determine that it would be autonomous, without coercion, with due freedom of thought guaranteed constitutionally? In this particular, even deliberative processes could be compromised, since it cannot be affirmed that the decision regarding a given vote would not be vitiated.

Furthermore, if a “self” can be constructed through external manipulation, the continuity of the self, the notion of personal identity, may also be threatened by the uncertain use of neurotechnologies, point out Maia de Oliveira Wood *et al.* (Maia de Oliveira Wood *et al.*., 2024)

The ANPD has already taken a position in the same sense,

Beyond the industrial potential and that of promoting the progress of science and human well-being, **technologies that interact with the brain raise ethical-legal questions of great importance**, notably due to **risks created for fundamental (human) rights such as the free development of personality, freedom of thought, privacy, bodily integrity, and non-discrimination**. According to a report of the Human Rights Council of the United Nations (UN), neurotechnologies affect human (and fundamental) rights in a unique way (UN, 2024, p. 18). For example, **neurotechnologies of the brain-computer interface type, such as Functional Magnetic Resonance Imaging (fMRI) devices and electroencephalography (EEG), instead of being used for medical diagnosis, can be employed by governments and private entities for the surveillance and monitoring of individuals** (Ienca; Jotterand; Elger, 2018, p. 270). The subject has been the object of intense academic and interdisciplinary debate¹ and has reached the most relevant international forums such as the UN (2024), the United Nations Educational, Scientific and Cultural Organization – UNESCO (2023), the Organization of American States – OAS (2023), and the Organization for Economic Co-operation and Development – OECD (2019). Thinking about the governance and legal regulation of neurotechnologies is one of the unfoldings of this global-scale debate. (Brazil, 2025, emphasis added)

One of the reflections that neurotechnologies awaken is, then, why protect mental privacy? This question can be approached in distinct ways. For now, the option is to approach

it under the ethical and legal aspect, and under such a lens the democratic aspects stemming from this discussion cannot be set aside.

Freedom of thought, although it is seen as the basis of the other freedoms, according to Maia de Oliveira Wood *et al*, the risk of brain reductionism, in which the functions neural would override integral human dignity, engenders an alert (Maia de Oliveira Wood *et al* ., 2024).

This is because, from a clinical point of view, neural data can reveal patterns and indicate psychiatric issues even before the individual has detected them, the last authors state. In simple terms, Medicine could early identify vulnerabilities which would allow them to be exploited in therapeutic contexts or for purposes of social manipulation. (Maia de Oliveira Wood *et al* ., 2024).

Mental privacy is what determines the human capacity for self-individualization, to think as a unique human being, reinforcing personal identity. According to Maia de Oliveira Wood *et al* the very evolution of the idea of the right to be left in peace demonstrates the mutation of the concept, in addition to demonstrating its currency, since it could also, according to the authors in question, protect against the decoding of thoughts and emotions. (Maia de Oliveira Wood *et al* ., 2024)

In this field of neural data, Yuste *et al* warn that the risk is the invasion of mental privacy and that, for this reason, neural data should be treated with protection similar to the other organs, to prevent the commercialization of thoughts. This is because the advance of AI may decode mental states, and thus new rights would serve to protect human identity. (Yuste *et al* ., 2017)

That is, according to the discussion proposed above, the collection and manipulation of that data, without the user's consent and without a predetermined purpose, whether by means of non-invasive devices — such as headphones, headbands, helmets, glasses, EEG, or neuroimaging — or by invasive means such as brain implants, may be subject to commodification with the aim of profit or of manipulation and surveillance for social, governmental, or commercial purposes; hence the concern of the authors cited in this chapter.

In the same sense, another question pertaining to the debate is personal identity, motivated especially by the idea that brain stimulation technologies, invasive or not, have the capacity to alter the behavioral pattern, mental states, and therefore also have the ability to mischaracterize a given individual personality. And at this point, what is at stake, above all, is the preservation of a given identity and of the integrity of an individual.

Jotterand and Giordano set out cases in which neurological interventions produced behavioral and identity changes and thus proposed a responsible clinical use for brain stimulation techniques. They cite, for example, Phineas Gage, whose accident with an iron bar destroyed part of his left frontal lobe, and who, before, was a calm, intelligent, disciplined man and, after the accident, became impatient, rude, and sarcastic. According to the text, the change was so radical that Gage's friends said he was "no longer Gage". (Jotterand and Giordano, 2011)

The same authors also cite the case of Mr. Garrison with moderately advanced Parkinson's, who: before the deep brain stimulation, carried out for the treatment of the disease, had a quiet, pragmatic, shy personality and had also been diagnosed with disease-related apathy. After the procedure, the motor improvement was significant; however, he became extroverted and sociable, had a change in political orientation (previously Republican, then Democrat), as well as coming to defend and make donations to environmental causes. In this sense, the authors point out, the patient's behavioral and monetary pattern was drastically altered. (Jotterand and Giordano, 2011).

The authors also point out other results in which patients came to have a certain *joie de vivre* after the treatment. But this concerns them, specifically, in the case of this type of stimulation if carried out outside medical use with the specific objective of changing the personality or altering the subjective experience of the self. Jotterand and Giordano believe that this trajectory would be neither impossible nor improbable, considering the economic and social forces that influence neurotechnological interventions. (Jotterand and Giordano, 2011)

The examples above served to conjecture what personal identity will mean if it can engender a change in personality, for example. Levy discusses whether brain intervention by means of chips or drugs for emotional alterations creates a new self and threatens personal authenticity, or merely removes obstacles to a potentiation of the self (the extended mind thesis), and that for this reason the question, for him, **would be which interventions to permit and under which conditions** thus moving away from the discussion of whether or not we should permit mental interventions (Levy, 2007, emphasis added)

The last paragraphs reveal the idea that if the mental space can be inferred, monitored, and even manipulated by techniques such as the already explained neuromodulation, without consent, autonomy and free will may also be compromised. Under this aspect, Garrafa highlights how autonomy and individual responsibility must be respected in decision-making

Article 5 – Autonomy and Individual Responsibility. The autonomy of individuals to make decisions, while taking responsibility for those decisions and respecting the autonomy of others, is to be respected. Special measures are to be taken to protect

the rights and interests of individuals not capable of exercising autonomy. (Garrafa, 2005)

Still exploring the example of Mr. Garrison, whose political orientation went from Republican to Democrat, the debate touches on another point of these neurotechnologies: the influence on decision-making power. (Jotterand and Giordano, 2011). In this case, the free and autonomous thought of the individual can also be affected, because if a brain stimulation or a device in interaction with the brain (BCIs) can manipulate a certain desired decision, how to determine that the action or choice was taken by the individual, since there was influence from the device or from the stimulation? From this question also derives the attribution of legal and moral responsibility for acts committed under such interference.

In the sphere of accountability, under the legal prism, Andorno and Ienca argue that these neurotechnologies can leave the individual unprotected and suggest that traditional human rights (privacy or freedom of thought) would not be sufficient to protect against the risks arising from neurotechnologies. They indicate that risks such as the recording of brain activity, the decoding of mental patterns, behavioral modulation, and interference with decisional autonomy require a specific legal category with the creation of neurorights: the right to mental privacy, to mental integrity, to cognitive liberty, and to personal continuity. (Ienca and Andorno, 2017)

The unfoldings of neurotechnologies continue; derived questions such as criminal liability and the right against self-incrimination also point to the importance of the discussion proposed here. Munhoz, De Ávila, and Pereira have already discussed the (il)legality and (il)licitness of the evidence, as well as of the highly personal rights of the investigated party in the production of evidence using neurotechnologies to access neural data. They attempted to explore whether evidence based on NT affects the right to silence and whether access to mental information violates the constitutional rights of the accused. (Munhoz, De Ávila, and Pereira, 2024)

For example, in the case of the brain reading of an accused person in which a neuroimaging technology is used and he is exposed to the crime scene and the brain recognizes the scene even though the accused has not revealed such information. In this particular, the risk of the mental reading of an accused person adds debates to the scenario of neurotechnologies and their implications.

Finally, Hamburg sets out the central concern with neurotechnologies and why it differs from the others, above all because it can directly access the biological mental substrate, and adds *“Any new technique for understanding how the brain mediates behavior could affect our*

lives for better or worse." (Hamburg apud Scarf, 1970). And it was this disquiet that the present research attempted to demonstrate.

5 FINAL CONSIDERATIONS

The advances of Neuroscience and of AI, added to the growth of Neurotechnologies, inaugurate a panorama of reflections about the human mind. Considering the access to brain activity and the modulation of mental processes by means of invasive or non-invasive techniques, some ethical implications may stem from access to such mental processes.

The potential of neurotechnologies is promising and desirable, above all in the treatment and diagnosis of psychiatric and neurological diseases such as Alzheimer's, Parkinson's, and depression. The sophistication of these instruments can promote health and well-being for individuals who are not healthy. However, the experiments and techniques, many still under testing or not accessible to all publics, engender questions about the unintentional or intentional consequences that may arise from the development and expansion of the use of these neurotechnologies.

Based on the records of brain activity, studies presented suggested that mental patterns could be decoded, and behavioral modulation, in addition to psychic surveillance with commercial or governmental and social objectives, concerns scientists, because interference in behavior, as in the cases analyzed by Jotterand and Giordano, brings reflections about individual autonomy, free will, human identity, consciousness, in addition to bumping up against the protection of mental privacy and the legal accountability that may eventually arise from a modulated action. It is still early to say whether a modulated action will be considered vitiated or not.

In light of the above, the general objective of understanding the ethical implications of new technologies in Neuroscience was explored in contexts with healthy and non-healthy individuals and with invasive and non-invasive methods. As a result, authors such as Maia de Oliveira Wood and *et al* identified that there is a social risk of pressuring an individual to adapt to a new "enhanced self", engendering the ethical question between what is therapy and what is enhancement.

Another risk is that the corporate, educational, or governmental demand for a certain behavior, desirable to such spheres, may be forced collectively through the use of the techniques explored in the text. For example, imagine a company that wants a highly focused and productive workforce and aims to modulate such behavior, or a government that desires a certain sexual orientation, for example.

Another ethical point indicated was the profit aspect with respect to the agency and dependence of some neurotechnologies which require constant connection and are linked to data centers. At this point, reflections regarding the processing of the recorded neural data, the risk of bias or not in the processing structure itself, involuntarily or not, are also revealed.

Furthermore, the egalitarian aspect of access to such technologies was questioned. In a case where such an equitable perspective is not possible, the theme of social, economic, and technological inequality would also be linked here. Aspects such as an ethical demand in the disclosure and promises made to the public about treatment and diagnosis using these technologies were also mentioned.

Furthermore, technical risks such as the possibility of displacement and retraction of the electrodes, biocompatibility, inflammation, and connection instability also press for the tests and studies in this area to be transparent and with informed consent, since specific cases such as those of Neuralink generated social noise especially regarding the supposed lack of these two components.

In this way, Maia de Oliveira Wood *et al* maintained the follow-up and monitoring by specialists in human rights and medical ethics in the implementation and in the results of these studies. In summary, ethical implications such as social pressure, inequality, coercive use, false expectations of recovery for some diseases, technological dependence, agency by large technology companies, security, storage, processing, and protection of neural data were presented, fulfilling the general objective of this work.

In addition, the combination of neural data mapping, identification of thought patterns, direct action on the brain, and the possibility of encouraging or discouraging a certain behavior revealed the theory of the possibility of individual and collective behavioral interference. Thus, should the assumption that emotions may eventually be intensified or reduced come to pass, self-perception would also be affected, giving rise to an estrangement from oneself and disturbing the idea of personal identity.

In view of this possibility of affecting individual characteristics, with the ability for depersonalization, the work explored new contours with respect to classic themes such as the construction of the individual, consciousness, identity, autonomy, privacy, and responsibility, answering the initial question: whether the new technologies in Neuroscience can bring ethical impacts to such concepts.

Finally, as a result, it was concluded that, yes, there can be ethical impacts on the classic concepts highlighted. The authors presented indicated that there may be impacts on mental privacy if neural data is accessed without consent and without the due clarification of the reason for collecting it.

Furthermore, studies presented, such as those of Burwell, Sample, and Racine, indicated that should thoughts and decisions receive interference, there is the possibility that such manipulation violates autonomy, since the individual will not be certain whether he is the author of a given decision or behavior. In addition, some techniques presented in the text, the case of Garrison, for example, in which a behavioral change was produced, reveal debates about personal identity and moral and legal responsibility.

In light of the above, many questions presented here lack discussion; however, from the ethical and legal point of view, one of the most notable concerns an action altered by a neurotechnology: if it is considered a violated and induced decision, this matters, because it may indicate a difficulty in determining whether the action that received the interference is autonomous, that is, the individual's own or not. For now, this work did not intend to exhaust the subject, but only to contribute to the first notions about the ethical implications of the new technologies pertaining to the brain sphere.

ABSTRACT

Tragic thinkers (Nietzsche) sought an understanding of Arché using a form considered today as inter and transdisciplinary. In this article we have developed three itineraries to address the issue of time and its implication in therapeutic care. In the first itinerary we return to Apollonian and Dionysian forces; in the second itinerary we bring the geometrization of thought (Bachelard) and complex thinking (Morin) to re-discuss the psi theory models of mind (third itinerary) and the proposal of new mental architectures that gain meaning from non-euclidean geometries. So, the purpose of this article is to re-establish a dialogue between Philosophy, Physics, Mathematics and Medicine, having geometry as a background to think about time and finitude.

Keyword: Time. Physical. Finitude. Geometry. Clinical Philosophy.

RESUMO

Os pensadores trágicos (Nietzsche) buscavam uma compreensão da *Arché* valendo-se de uma forma considerada hoje de inter e transdisciplinar. Neste artigo desenvolvemos três itinerários para abordarmos a questão do tempo e a sua implicação no cuidado terapêutico. No primeiro itinerário retomamos as forças apolíneas e dionisíacas; no segundo itinerário trazemos a geometrização do pensamento (Bachelard) e o pensamento complexo (Morin) para rediscutimos os modelos de mente da teoria psi (terceiro itinerário) e a proposta de novas arquiteturas mentais que ganham sentido a partir das geometrias não euclidianas. De modo que o objetivo deste artigo é reestabelecer um diálogo entre a Filosofia, a Física, a Matemática e a Medicina tendo a geometria como pano de fundo para pensarmos o tempo e a finitude.

Palavras-chave: Tempo. Física. Finitude. Geometria. Filosofia Clínica.

arquitecturas mentales que cobran sentido a partir de las geometrías no euclidianas. Así, el propósito de este artículo es restablecer un diálogo entre la Filosofía, la Física, las Matemáticas y la Medicina, teniendo la geometría como trasfondo para pensar el tiempo y la finitud.

Palabras clave: Tiempo. Física. Finitud. Geometría. Filosofía Clínica.

1 INTRODUCTION

Time is the term upon which we reflect and within which we existentially find ourselves immersed. This concept, addressed in the most diverse areas of knowledge, gives rise to reflections that are at times abstract, at times concrete, to the point of making speech, the act of saying, impossible (Santo Agostinho). In this article we pursue this precious concept in its many appearances throughout the act of knowing, focusing on its geometric appeals (Mathematics), on its subjective dimensions (Psi areas), and on its field of infinity and finitude (Philosophy, Physics and Medicine). The aim of this article is to re-establish a dialogue between Philosophy, Physics, Mathematics and Medicine, with geometry as a background capable of establishing a tacit relationship with these areas of knowledge, especially Clinical Philosophy (CP).

Today, more than two thousand five hundred years removed from the Greeks, the correlation between these areas of knowledge (Philosophy, Physics, Mathematics and Medicine) seems absurd and unscientific; however, we shall point out the present relevance of these relationships through three itineraries. In the first, we shall return to what Nietzsche called tragic knowledge, namely, a knowledge in which Apollonian and Dionysian forces were opposed yet complementary, resulting in a worldview in which the void, the nothing, the infinite—themes set apart from our knowledge (Heidegger)—permeated existence. In the second itinerary we shall engage in dialogue with the concept of interdisciplinarity that permeates complex thinking (Morin) in the light of Gaston Bachelard. In the third itinerary we enter the field of subjectivity and the need to update our mental spaces with the most current theories of Physics. In both itineraries, Clinical Philosophy (CP) is focused upon as a locus of investigation of these developments. A locus that refers us directly and indirectly to the fragility, to the finitude that permeates us as human beings.

CP is a Brazilian therapeutic proposal, systematised by the gaucho Lúcio Packter, which draws upon philosophical thought for psychotherapy. A decolonial appropriation of thoughts regarded as abstract for the assistance of people situated in the world, that is to say, the application of Philosophy. An application that has a long tradition in the Western school and which is being taken up again nowadays (José Barrientos, Jorge Dias, Lou Marinoff, Tin Lebron, Yves Leloup, to mention a few), who discuss among many things one premise: if philosophical thought is the support and foundation of various therapeutic processes, why can it not be applied to philosophical practice itself as a practice of care? Such a question plunges us into ethical and methodological discussions that we shall not enter into; however, we shall follow the path that the great physicists, mathematicians and jurists have always taken, that is, to transpose philosophical thought, giving it materiality, existentiality. In other

terms, in the undergraduate study of Philosophy, ideas are taught as abstract entities, devoid of existentiality. They are empty and infinite concepts that inhabit the world of ideas in a clear distinction between being and thing, body and mind. Nevertheless, in Physics, in Mathematics, in the Social Sciences, in Biology, in Medicine, the ideas of philosophers take on body, materiality, formulae, the building of worlds, technological elaborations. It is from this place of praxis that Packter discusses philosophy as a bearer of meaning for thinking, dialoguing with and caring for human pains. Not in their medical sense, but in their onto-existential dimension.

In ontology, the dimension of time arises, erupts, appears. And alongside it the confabulations about the finite and the infinite. The most imminent of these perceptions in the field of Physis is the apeiron of Anaximandro de Mileto. The eminent professor Roberto de Andrade, reflecting on the elucidation of what this concept might be, suggests:

The word can be translated as “infinite”, “indefinite”, or “unlimited”. It is an abstract term, perhaps invented by Anaximandro himself. It is possible that he wished to indicate with this word a kind of matter that does not correspond to anything definite, but that can take on the appearance of all the kinds of substance that we know. Perhaps this idea was a step forward, a new degree of abstraction, from the idea of Tales. (...) Anaximandro seems to have imagined an unknown substance, perhaps even impossible to observe, which could serve as the origin of all the others. From the apeiron, which is neither hot nor cold, heat and cold would arise; from the apeiron, which is neither hard nor soft, hard and soft substances would arise. (Andrade, 1994, p. 36-37)

This search, not for the Arche, but for the understanding of time, has run through the history of philosophical, mathematical and physical thought. The attempt to name this indefinite, this amorphous state that gives form to things, this infinite, has been the subject of long and elegant discussions. In one of these discussions, the amorphous, the formless, this indefinite, acquires the concept of anguish in Heidegger, of nothingness in Sartre. Both assist in the philosophical experiment of rooting philosophy in the concreteness of the world.

In philosophical training, students are led to believe that concepts such as apeiron are no more than abstract ideas, lost at the beginning of philosophical practice. Mathematics students are led to discuss the infinite, but sometimes without dialoguing with the philosophical thought that underpins it. Inter- and transdisciplinarity help to bring knowledge closer to a totality.

One may, in a brief and swift historicity, point out how this concept of the infinite unfolds in Isaac Newton in the “invention/discovery” of the calculus. In Georg Cantor, a magnificent German mathematician of the twentieth century, with the demonstration of his studies on the existence of many infinities. In quantum mechanics and the need for renormalisation.

The search to name the infinite runs through the attempt to answer real problems, to solve concrete questions of the human spirit. It is in this sense that time, finitude, death—more than empty abstractions—are questions dear to existence and to existing. So that the themes, the concepts, bring professionals closer together, break down specialisations, and create spaces of constructions and investigations that are at times new, at times tragic, in the historical sense of the first itinerary.

2 FIRST ITINERARY: TRAGIC KNOWLEDGE. CIRCULAR TIME

When Nietzsche returns to the Greeks, from a more aesthetic than epistemological perspective, more musical than literary, he hears, more than he sees, that the “Greek miracle” contained the balanced, complementary form with which they dealt with two opposing yet complementary forces: the Apollonian and the Dionysian. The Apollonian, directly related to the god Apolo, is related to beauty, to form, to elegance, to the visual, to the clear, to the day. And the Dionysian, related to the god Dionísio, is associated with shattering, intoxication, the playful, wine, ecstasy, the dream. Both bring and have music as a positive intersection. Nietzsche saw in this combination what he called the tragic, understood by us in another work as follows:

The TRAGIC is the force, the power that escapes form and beauty, and it is equally the ordering, the measure, the measurability of the power that escapes. It is the representation of the world and the world itself. It is syntax and semantics, concept and music, opposites and complementarity. The TRAGIC is what contains and overflows existence at one and the same time. The TRAGIC is existence and transcendence, the physical and the metaphysical. The representation that oppositions and antagonisms are the fruit of human language, of human understanding (Heisenberg and the Uncertainty Principle) and not of being itself, of the world itself (Bohr and the Complementarity Principle). The TRAGIC turns out to be the impossibility of expressing oneself other than through antagonisms that complement one another, and which is symbolically represented by Nietzsche as Apolo and Dionísio. The Apollonian and the Dionysian are theoretical constructions that allow for the possibility of unifying, in the best style of the Romantics, epistemology and aesthetics. (SANTOS, 2021, p. 64)

In other terms, the Greek tragic overflows and unveils the beauty of truth, the symmetry of beauty, the elegance of justice. Three angular bases for the knowledge we shall foster in this article. So that the tragic is, then, the complementarity of threatening, terrible forces which, however, the Greek genius embellished and balanced. This balance is pointed out in music, in science, in philosophy, in medicine, in art, in the search for meaning. In truth, part of this meaning is well expressed in the epistemological tradition of the West through shadows.

The Greeks were those who dealt with shadows, whether with Tales de Mileto (624 BC to 546 BC) measuring the size of the pyramid by them, or with Erastóstenes de Cirene (274 BC to 194 BC) measuring the circumference of the Earth; or with Platão and his consecrated allegory. In each of them there emerges the capacity of a culture to see and to seek the understanding of what is seen from a different, non-apparent perspective. To access one part of existence without concealing, denying, or annihilating the other. This “tragic knowledge”, Nietzsche affirms, Socratism unbalanced by becoming more Apollonian than Dionysian, that is, more precise, conceptual, formal, solar, mathematical.

In an implicit dialogue with the Pythagoreans, later generations delineated a world of precision, of quantification, of normalisation (Apollonian), as being capable of explaining and replicating the Greek universe (Santos, 2021). Forgetting the highly qualitative, Dionysian aspect of the Pythagorean current, which in its origin is confused with sects of religious initiation.

In Nietzsche's view, the Socratic reading caused an imbalance that silences the tragic. A silencing that causes philosophy, science and medicine to abandon and neglect finitude, death, non-being. Components inherent to existence which can be symbolised in King Midas's pursuit of Sileno, who thus prophesies to the king:

Miserable and ephemeral race, children of chance and torment! Why do you compel me to tell you what it would be most beneficial for you not to hear? The best of all is utterly unattainable for you: not to be born, not to be, to be nothing. After that, however, the best for you is to die soon. (NIETZSCHE, 2003, p. 36)

Far from a pessimistic view, from a nihilism, Nietzsche saw in this pursuit, in this tragic, the necessity of an affirmation of life. A necessity that places him as one of the pioneers of existentialism, since it is in existence that the tragic is realised. Since the tragic is a component inseparable from existing. And in this existing the forces of life cast us forth, whipping us along, leading us to attribute meaning.

Here multiple paths open, of which we shall point out two. First, the concept of will to power (WP) and eternal return (ER).

The second and prior is what Aristóteles called Thaumá. A Greek word that means ASTONISHMENT. Not in the sense of fear, of terror. Astonishment in the sense of admiration, contemplation, indignation.

This astonishment is the original startle that the child would feel upon being born, upon perceiving that it had truly been born, as Alberto Caeiro tells us in O Guardador de Rebanhos. This astonishment/Thaumá is the origin of Philosophy. However, more than the origin of Philosophy, it is the origin of all questioning, of all inquiry, of all art, of all science, of all

knowledge. They are born of this original amazement. An amazement that, when uncorked, glimpses the central problem that accompanies us—finitude. We die.

Death is the central theme of existence, and alongside it its opposite and complementary part, life. It is in the search for the understanding of this mystery that we bring together life and death, or more precisely, philosophy, physics, mathematics, medicine, clinical philosophy. But, before entering into this itinerary, we shall stroll through the Nietzschean concept of WP and ER, a swift stroll.

Nietzsche, as a good tragic philosopher, also thought on the basis of problems. Many researchers and commentators of Nietzsche establish a dialogue of his theories with Biology; however, I have preferred to bring his dialogues with Physics.

The criticisms that Nietzsche makes of Kant internalise a Newtonian conception of the world. Kant is the first to awaken philosophers from the dogmatic dreams of an ontological explanation of the universe and of existence. From a central problem, namely, how was it that Physics, which had been subaltern to Philosophy until a few centuries ago, managed in so little time to advance so much? Kant shows us that, by abandoning the WHY and moving towards the HOW, Physics evolved more than Philosophy and Theology. But can a philosopher abandon the why?

Kant shows us that he cannot, while at the same time he gives us the itinerary as to what to ask and as to what we may expect answers to. Thus, he establishes the limits of reason. Philosophical and theological thought has no limits. More precisely, the theological has the epistemological limit of faith. The philosophical, on the other hand, can produce interminable arguments that existentially lead nowhere. And Kant, like others, had already believed that knowledge is Apollonian, that is, metric, reproductive, Cartesian, scientific. To know is methodically, in a Cartesian manner, to pave paths of rational, intelligible understanding, with clear and distinct ideas.

These certainties trouble Nietzsche; he wishes to understand not what is being seen and shown, but what is being heard yet hidden. The concepts of WP and ER mark this place, this relationship with the infinite, but tied to existence, to life. In the ER, the German philosopher of the nineteenth century rewrites Kantian ethics no longer through the thou shalt of the power of inertia, but through the thou chooseth, through the act of one's will.

In the Kantian thou shalt, in the Newtonian cosmos, there is a God who normalises all forces and all wills. There is a normal force that balances actions in spite of the subjects. In Nietzsche it is the will to power, it is the amor fati that derives in subjects the 'responsibility', the joyful taste and enjoyment of choosing only that which the subject would not mind repeating throughout all eternity.

This circular cosmos in which all things tend to repeat themselves. This cosmology in which there is no God to punish or to save is the tragic idea in its Greek conception before Sócrates. It is this dialogue with life, with existing, that caused those thinkers to have at one and the same time done philosophy, mathematics, geography, physics, medicine, astronomy. There was no distinction, because all knowledge was life.

Knowledge dialogued with the real problems of these men and with desperate, hopeless, joyful, wrathful attempts at explanation in the search for a meaning that transcended Apollonian reason and entered into the intuitive Dionysian. This encounter being the tragic. In other terms, tragic thinkers sought an explanation that had to be rational and not to resort to the gods, but at the same time, they understood that reason, in its Apollonian attributes, has limits. The marker they used was one: how to explain the phenomenon without divinising them?

Yet there is an immense distinction, an abyss, between the divinisation of the phenomenon and the attempt to mask the mystery that surrounds life and death. The great scientists, philosophers and physicians looked at this abyss without averting their gaze. They went to seek meaning. Some groups of historians and commentators, however, created a line in which the Dionysian was removed from existence. It was elevated to the condition of the unnatural, the abnormal. It is thus that Sócrates, who fell into permanent trances, remaining for hours in a catatonic state, conversing with his Daimon, was elevated to the condition of the first rational philosopher, with these events almost erased from his history.

It is in this same historiographical perspective that Newton is elevated to the condition of the icon of modern science, that is, the science of calculus, of mathematisation, of precision, at times even of atheism; when the most appropriate thing would be to see him as the “Last of the Magi” (THUILLIER, 1994; WESTFALL, 1995; KOYRÉ, 2001).

In the same historiographical lineage we have Kant who, if on the one hand he modelled the thought of Newton, on the other dialogued with the thought of the mystic Emanuel Swedenborg, a Swedish scientist, physicist, philosopher and spiritualist of the eighteenth century (DAVID-MÉNARD, 1996).

All the limits of reason that Kant establishes between knowledge and the probable have these two antipodes as their parameter. So that, outside a historiography that makes Apollonian cuts, that is, believing that History has an internal rationality, a linear horizon whose making must be stitched together by the historian on the basis of great deeds, great names, great geniuses, without opponents and interlocutors, we wish to present another. Another that erupts when we open up to more thematic, more fluid conceptions, in which the themes, the beings, the characters converse among themselves regardless of time, area,

locality. This “indefinite, amorphous” history is a complementary part of definition, of conceptualisation.

3 SECOND ITINERARY: GEOMETRY AND/OR COMPLEX THINKING, LINEAR TIME

To think about History and the very making of history refers us to a tacit concept that permeates this article—time. We shall not dare to conceptualise it, but we shall highlight it as being the space, the place, in which various areas of knowledge come together developing new existential cartographies. These cartographies allow us to use the complex thinking of Morin to see the whole in a part and, from this whole, to understand the parts.

In this mirroring we wish to reveal the concept of interdisciplinarity. Isabel Brasil Pereira reminds us that: “for Piaget (1981, p. 52), interdisciplinarity can be understood as the ‘mutual interchange and reciprocal integration between various sciences’.” It is this integration that the complex thinking of Morin elicits.

Morin, like Bachelard, models the thought of Descartes, presenting new readings. Morin elaborates this discussion on the basis of the idea of the recomposition of the Cartesian parts. Thus Descartes reminds us in the Discourse on Method:

The first was never to accept anything as true that I did not evidently know to be such; that is, carefully to avoid precipitation and prejudice, and to include nothing more in my judgements than what presented itself to my mind so clearly and so distinctly that I had no occasion to call it into doubt. The second, to divide each of the difficulties that I examined into as many parts as possible and as were necessary in order to resolve them better. The third, to conduct my thoughts in order, beginning with the simplest and most easily known objects, in order to ascend, little by little, as by degrees, to the knowledge of the most composite, and even supposing an order among those that do not naturally precede one another. And the last, to make in every case enumerations so complete and reviews so general that I could be sure of omitting nothing. (Discourse on Method, p. 21)

Morin proposes the recomposition of these parts in search of a totality that positivism, equally French, abandoned. Another aspect to highlight is that Morin seeks not the idealist, German totality that Comte, a good Frenchman, opposed. The totality that Morin seeks is the one that approaches what we are calling tragic.

The totality he yearns for is that philosophical dream of seeing the whole, that is, of dialoguing with all the parts, of dialoguing with the multiplicity of gazes. Upon entering these parts and dialogues, to understand, although not necessarily visualising, that the organisations and compositions of this multiplicity may occur in various modes, in many forms, in many ways (listening is one of them). Whether through a linearity seeking the cosmos and causing entropy; whether through a chaotic circularity generating new types of

order (Ilya Prigogine); whether through multiple, varied orderings whose hallmark, whose essence, is holography (Bohm) of each part reflecting the whole and this whole multifaceting innumerable parts. Order and chaos interpenetrate one another, consolidating life, existence, the tragic.

Morin closes for us this perspective that re-elaborates the place of the specialist. He (the specialist), possessing one part of knowledge, must dialogue with other areas of knowledge in order to visualise, listen to, scrutinise a possibility of totality, originating now not from a single point, or from a single man/woman, but from interdisciplinarity, from a network of interaction.

This vision of totality, constructed by means of almost alchemical amalgams, is called, in clinical philosophy, autogeny. Lúcio Packter thus states in the Caderno G3: “An autogenous process can be illustrated when we partially fuse two metals and thus weld them together.” (Packter, p. 7).

These chemical combinations that result in substances other than the two or other initial ones are how the systematiser of CP understands the interaction of aspects of the structure of thought, amalgamating the elaboration, the expression of a singularity. Let us see how the clinical philosopher Cláudio Fernandes presents the concept:

The word autogeny (...) draws attention to the fact that it is not a common word, neither in philosophy, nor in the clinic, nor in the sciences. Composed of the Greek word “auto”—that which is one's own, that which does not depend on third parties—and also of the Greek “genos”—origin or birth. Directly, without complicating, “autogeny” can be understood as the quality of that which is originated by itself, independently of force or resource external to itself. (FERNANDES, 2021, p. 257)

Autogeny, as understood by us in Clinical Philosophy, is at one and the same time the overall vision, the vision of totality, that is revealed at the end of the stage, just as it is the vision of totality that presents itself in each part of the stage. Stages that are didactically taught, divided in a Cartesian manner into three great axes that are structured from the gathering of historicity into: a) categorial base; b) structure of thought (ST); c) submodes (SM).

Every elaboration begins in the narrative of one's own life, told by the person themselves, HISTORICITY. And, possessing this data, the clinical philosopher situates this other existentially, (a) categorial bases. Observes what inhabits them (b) structure of thought. Understands their modes of being (c) submodes. (AIUB 2010, GOYA 2014, CARUZO 2020, CLAUS 2013, PACKTER 1997, CARVALHO, 2008). Nevertheless, each of these stages, of these phases, taken in isolation, cannot remove the epiphany of the face (Levinas). At each

stage the analyst cannot fail to re-cognise the PERSON in their entirety before them. This recognition takes place through autogeny.

In other words, it is the alchemical resource that is in all stages and that will once again unveil itself in the whole. It is beginning and end. Inside and outside. Self and other. Approximation and distancing at the same time. In all the parts it is the person who is sought. And in this totality of the search it is the singularity of the person that unveils itself and makes itself known. That which mirrors this being in itself and not another. Opening up to the same and another paradox, since that which in him is wholly otherness, and, consequently, the identity of the face, that is, human universality. Yet a singular human being, for that face is his. The miscellany of times, places, circumstances, relationships fuse together, amalgamate, forming and constituting the person. These paradoxes of the universal in the face of the singular touch upon the questions of our geometric thinking.

The “New Scientific Spirit” of Gaston Bachelard, more than modelling the “Discourse on Method” of Descartes, opens up a guide to understanding that is very dear, though little explored, the geometrisation of Western thought:

(...) let us first recall the long unity of geometric thought: from Euclides and for two thousand years, geometry receives, without doubt, numerous additions, but the fundamental thought remains the same, and one may believe that this fundamental geometric thought is the foundation of human reason. (Bachelard, 1968, p. 26)

Much is spoken of the influence of the thought of Aristóteles on Western culture, but at times we forget to mention the force of the thought of Euclides. His geometric, Platonic vision, in many measures of the world, was only overturned, or perhaps questioned, in the eighteenth/nineteenth century with Johann Carl Friedrich Gauss (1777-1855), Georg Friedrich Bernhard Riemann (1826-1886) and Nikolai Ivanovich Lobachevsky (1792-1856). Hence, the consolidation of such a conception takes place truly in the twentieth century with the theory of relativity.

For nearly two thousand years our mental architecture was structured in a linear, Cartesian manner. Thoughts outside this notation were regarded as discordant, abnormal, mad. The parametrisation instituted by the Newtonian mechanistic paradigm entered into social relations and even into our understanding of psychic structuring.

The success of industrial mechanics occupied all the spaces of the human mind and imperceptibly led man to apply it to another reality: to society. This, before the advent of science, was conceived as a body of hierarchised forces that moved within a static system, the ancien régime. (...) As science produced industrial mechanics to transmute the order of nature, it will now produce social mechanics for the <magus> who

produces technical artefacts; here the scientist appears as the <revolutionary> who produces new social regimes. The social revolution came after the industrial revolution. The latter is considered the matrix of the former. (BUZZI, 1985, p. 113)

This matrix establishes a new cosmos, or a new paradigmatic organisation of understanding, which spreads out to the various segments from the social to the psychic. Segments of a straight line that we are at all times seeking to interrelate, mirroring an interdisciplinary understanding in what Morin bequeathed to us as complex thinking.

It is in this segment that we can observe the various currents and historical interpretations, bringing together the most diverse historiographies. Historiographies which, when they ask themselves about the making of history, open up a distinction between it and the Philosophy of History, although they interpenetrate one another (MALERBA 2016; RUSEN 1987; TOPOLSKI 1999; COSTA LIMA 2011; BURKE 2011; to mention a few who elucidate these approximations and distinctions). More clearly, when we enter into the concept of time, various fields of knowing and of knowledge have their contributions to offer.

History cannot be left out, but our search is not historiographical, rather it is the interdisciplinary approximation that opens us up to the complexities that Morin explores so well and which can be found in Bachelard decades earlier:

Einsteinian mechanics increases the comprehension of Newtonian concepts. Brogliean mechanics increases the comprehension of purely mechanical and purely optical concepts. Between these last two groups of concepts, the new physics determines a synthesis that develops and completes Cartesian epistemology. If we knew how to double objective culture with a psychological culture, absorbing ourselves entirely in scientific research with all the forces of life, we would feel the sudden animation that the creative syntheses of mathematical Physics give to the soul. (Bachelard, op. cit., p. 151)

We insist on Bachelard because, besides the dialogue with the current of complexity of the French school of which he is part, he was one of the first to point out the need for Philosophy, for the human sciences, to accompany the developments of mathematical Physics.

It is still by meditating upon the object that the subject has the greatest chance of deepening. Instead of following the metaphysician who enters his room, one may, therefore, be tempted to follow a mathematician who enters the laboratory. Soon, indeed, there will be inscribed over the door of the laboratory of physics and chemistry the Platonic warning: 'let no one enter here who is not a geometer.' (Idem, p. 143)

It is curious that the warning proposed by the French physicist, far from calling for an objectivist realism, opens the doors to reveries, dreams, the psychoanalysis of fire. It opens

the doors to a highly tragic science, by allowing the Dionysian elements of scientific practice to enter the laboratory. Bachelard's criticism is of the post-Kantian.

His criticism is of the closed bodies of knowledge that do not open up to new experiences and continue to idealise a world that has been altered, complemented. In the incomprehension or myopia of this new scientific spirit, pseudo-problems are fantasised and created that only exist in the philosophical obstinacy of not experiencing the advances brought by Physics.

The radicalness of this criticism, in his eyes, lies in the philosophical insistence on seeing a world through the Cartesian-Kantian lens, whether through the body-mind duality, or through the understanding of space and time as a priori and absolute categories. But, before entering into this psychologism, we shall briefly bring a historiographical vision through the geometric lens, and how, in this lens, we shall visualise the fields of the human psyche (Morin's complexity).

Apparently, the first historical imaginary concerning time seems to be circular. It is thus that the mythoi are told, narrated, in the most diverse traditions, and remain current even today (Levi Strauss, Joseph Campbell). An event, which erupts through magical designs, takes on corporeality and is repeated each time it is re-told.

This circularity is the notation of the tragic. It is what Nietzsche heard and only Wagner understood. It is the return of the same, but it is above all the hero's attempt to defeat the Moirai, to overcome their destiny. The heroes, both in the Greek mythoi and in the most diverse cultures, are precisely those who, knowing their destiny (the circularity of the prophecy), struggle against it and, in precisely this, end up reaffirming it.

In a subsequent step, in the search for a rational explanation of facts and events, thought acquires a linearity. An amazement/Thauma at trying to explain natural phenomena not through the gods. The image would be a segment of a straight line that detaches from the circle. This idea and will, which no longer wishes a return of 360° to a narrative explanation of the world, is more than the beginning of philosophising. It is the hallmark of thinking.

A thinking that even re-turns upon itself, in a process of reflection that dialogues with the shadows we pointed out in the first itinerary. A thinking that progressively liberates itself, creating thousands of segments of straight lines, often parallel, sometimes perpendicular to one another. In any case, they are linear. A linearity which, through a process of amnesia, forgets the circle and comes to postulate that a segment of a straight line was the beginning of everything and that there is an end to everything (Truth and Lie in the Extra-moral Sense).

A linearity that, centuries later, will acquire factuality and causality. From this belief in beginning and end, one comes to draw a cause-consequence relationship that crystallises a

linear understanding of historical facts and events. Event (A) was caused by factor (X), almost in a vectorial, planified relationship, similar to two magnetic, gravitational forces in action.

In this new construction, the historian elucidates, explains, in a Cartesian manner, the succession of events that occurred in time and space. In some historical periods one dared to give these explanations the same objectivity with which one postulates algebraic relations of addition, subtraction, multiplication, division. History came to be visualised as a succession of events that left no remnants, in which, with one event parametrised, one had its modelling on the Cartesian plane.

This positivist, realist conception can be found even when the geometric format becomes spiral. We are thinking of dialectics, whether Hegelian or Marxist. There was and still is, in some historical currents, in some currents of knowing and of knowledge, an omnipotent, omnipresent feeling. The specialist knows everything in their area. They are no longer a man, nor a hero; possessing the knowledge of their speciality and the linearity of their knowledge, they are god. Imbued with a knowledge that can be modelled on the Cartesian plane, they give answers to everything that can be asked (Kant).

At this spiral moment, and not only in it, historians looked at time as being capable of elucidating, clearly and distinctly, the events of the past, and of foreseeing, determining, anticipating, controlling future events. This clarity is better evidenced both in the positivist motto: “to know in order to foresee, to foresee in order to know”, and in the class struggle as the “engine of history” and the union of workers as revolutionary insurgency for the alteration of exploitation. As regards the rationality of historical events—idealists, positivists and Marxists were all enlightened, too humanly so.

Beyond a society that trains specialists, it should be clear to any historian the similarities between the positivist historiographical interpretation and Newtonian mechanicism. The clear, rational, triumphant, Apollonian understanding that, in this historiography, the narrative is structured that control was achieved over the principles of causality that govern the world.

In these same dialogues one can observe the correlation between Hegelian rationality and the electromagnetism of James Clerk Maxwell (1831-1879). In this relationship there is an omnipotence of reason hitherto unseen. In that historical period (nineteenth century), which endures still in many mentalities, a certainty is edified that there was nothing more to be discovered, to be known. The apex of knowledge had already been reached. They dominated magnetism, electromagnetism, and with this everything that could be known.

The historical movements were already registered, and for the next steps there was no space for the new, the different, the unusual. The European man of the nineteenth century

had control of his modes of production, of his consumer goods, of his relations. In a way, looking back, it becomes clear that they did not understand what dialectics is. And it is in this lack of understanding and within this myopia that non-Euclidean geometries arise, and alongside them new time-existential modellings.

Time becomes place, transforms itself into space and engenders new rhythms, new possibilities. The third and fourth forces are unveiled, observed, researched, as are the fourth and fifth dimensions. The infinite, whether in its macro appeal, or in its micro appeal, “returns”, haunting minds, hearts, imaginaries, perspectives, understandings. The openings of possibilities of the imaginary widen fields and spaces in the most diverse areas of knowledge. And here it is in fact interesting, because time can be observed not as a straight line whose direction is evolution. Time acquires variables and takes up again thinkers, ideas, postulates that had already been forgotten.

This thematic historiography becomes atemporal. The units come to be given by the problematics experienced. It is thus that returning to the past, going to the present, drawing the future, is one and the same movement of recognition for those who thought their time. This is the tragic circularity of Nietzsche, who, even in the nineteenth century, was dialoguing with the twentieth, the twenty-first, and the tragic philosophers of the sixth century BC. It is the same circularity that allowed and allows us to bring together Morin and Bachelard.

So that, if at a first moment we glimpse a time of Apollonian characteristics, in its direct, objective and linear causal relationships; at a second moment, we behold a Dionysian time (SANTOS, 2021). Almost a non-time, since its displacement occurs in a zigzag, observing the historiography of science from a biological perspective (FLECK 1986), in a discontinuous manner, with a thematic character.

A theme that arises, emerges as a phenomenon from the relationship, from the circumstances of the problems faced (Bachelard) and at times is emptied, loses interest, does not attain the consolidations for a normal science (KHUN 1997). This non-time produces other geometries and systematisations that break the linear structure. I shall draw upon Conde and Jeferson for an approximation to these ideations, although the professors are weaving a narrative that does not depart from our ideations of the moment:

One then came to attempt to understand the process of the establishment of scientific facts, of how the acceptance of these and of the theories that were founded upon them was negotiated. What this approach revealed was that these two aspects of negotiation—the factual and the interpretative—were simultaneous and circular: the conclusions giving form to the descriptions of the facts, and these constituting the conclusions drawn from them. The circularity evidenced showed, among other things, how fragile was the weight given to experiments in the determination of their results,

and how scientific interpretations and conclusions depend on contingencies and on non-rational factors. (OLIVEIRA E CONDE, 2002, p. 4)

It is here, at one and the same time, that we enter into psychologism and seek to go beyond it. We enter by bringing the genius of Freud in parametrising the internal, private states of subjects, while at the same time decoding aspects of the mind regarded as linguistically non-existent. We seek to go beyond, because this revolutionary notation of Freud adopts a mechanistic-Cartesian model of Euclidean notation, that is, absolute, universal, linear. A model of an atomic self that progressively pulverises in the face of new clinical, physical, mathematical and social observations.

4 THIRD ITINERARY: INTERNAL CARTOGRAPHY, THE DISSOLUTION OF THE ABSOLUTE SELF, SUBJECTIVE TIME

Mathematics is the mother of all figured thought. It permeates and structures constructions. In part, it is the Platonic eidos derived from the Pythagoreans. That essence which gives form to the world, to things, to being. The amusingly strange thing about this construction is that this ipseity is the characterisation of Philosophy. Is Philosophy, then, a mathematics?

For example, zoology studies animals, astronomy, celestial bodies; what does mathematics study? The obvious answer: mathematics deals with numbers, figures, and other abstract objects of the kind; more than a solution, it is a source of new questionings, for what, after all, are numbers, figures and other mathematical objects; what reality should one attribute to them, are they mere inventions of ours or do they exist independently of us and, if so, what place do they inhabit, since they are spatio-temporal objects. In general, what kind of object is an abstract object of mathematics? (SILVA, 2007, p. 14)

Professor Jairo's questioning is very similar to that which Maura Iglesias addresses in her chapter—"What is Philosophy and what is it for".

(...) perhaps it is possible to say and to understand what physics is, from outside physics; and to say what chemistry is, from outside chemistry. But, in order to say and to understand what philosophy is, it is necessary to be within it. "What is physics" is not a physical question, "what is chemistry" is not a chemical question, but "what is philosophy" is already a philosophical question—and perhaps one of the characteristics of the philosophical question is the fact that its answers, or attempts at answers, never exhaust the question, which thus remains with its force as a question, inviting other people and other possible approaches. (IGLÉSIAS, 1986, p. 12)

Philosophy, in this conception, is a pointing, a doing, as Heidegger emphasised. In this pointing, the clearing opens up, the opening is created in which we situate ourselves. A

clearing, an opening in which the tragic philosophers believed that yes, philosophy is a mathematics. Or, not only mathematics, it is also Physis, Bios, Metaphysics.

It is physis both in its appeal of essence, and as natural laws, and also as the physical world, that is, the totality of the mineral, vegetable, animal kingdoms; natura that approaches biology. Bios that in its opening narrows the dialogue with complex thinking.

It is in complexity that life happens. It is in life as concrete existence that the parts unveil the whole and the whole reveals the parts. It is in existentiality that beautiful, plausible, real abstractions, as mathematical, abstract objects, such as a thousand-sided polygon, or a perfect circle, or mountains of gold, are not found in reality, although they fit into language, into the mind, as Bachelard warns us: "It is upon the immutable character of the architecture of geometry that Kant founds the architectonic of reason. If geometry divides, Kantianism can only be saved by inscribing the principles of division in reason itself, that is, by opening up rationalism". (Bachelard, 1968, p. 26)

Sigmund Freud (1856-1939), in his elaboration of the human psyche, draws upon a Cartesian-Kantian matrix with a thermodynamic model of fluids.

Thermodynamics is the branch of the physical sciences that deals with various phenomena of energy and the properties of matter related to it, especially the laws of the transfer of heat into other forms of energy and vice versa. (UFPEI, 2022)

Energy in Freudian theory is understood as libido. Its functioning will be analogous to that of fluids. By fluids one understands: "a substance that deforms continuously, that is, flows, under the action of a tangential force, however small it may be." (GOMES, 2022).

This deformation, flow, force and tangential action will receive the characters of drives, manifesting in each of the phases of the subject's development. A certain lack or excess of flow in a phase tends to entail x, y, z situations.

However improbable it may seem, Freud, in his search for a scientific psychology, models a conception of mind, neurophysiological, but observing that a significant part of hysteria was not of a physiological order, but of a libidinal one. Let us read a little more:

Any resemblance of this mechanistic supposition to the underlying ideas of the "Project for a Scientific Psychology" (1895/1976c) is not mere coincidence. Considered by Freud one of his "idols", Helmholtz founded, together with other physicists and physiologists, among whom E. Brücke, Freud's teacher and master, the scientific movement that would bear his name—the Helmholtz School of Medicine—whose programme consisted in applying physico-chemical postulates to the living organism (Jones, 1953). Now, the "Project" avowedly aims to project into the psyche suppositions of the hard sciences of Freud's time, well in line with the programme that Binswanger qualified as reductionist. The historian of psychoanalysis, Andersson

(2000), nevertheless points out that the Helmholtz School was part of an innovative tendency, which reoriented medical research from anatomy to physiology, from the until then over-valued attempt at anatomical localisation of mental illnesses towards the study of the functions of the nervous system, researched by means of electrophysiology. For the author, this new approach would have allowed Freud to undo the confusion between organic paralysis and hysterical paralysis, a distinction which even Charcot proved incapable of making, because he was still caught up in the old localisationist paradigm. (VIDAL, 2009, p. 270)

Freud, at the end of the nineteenth century and the beginning of the twentieth century, widens and deepens our worldview, “however” his modelling of the psychic apparatus is still Kantian, that is, Newtonian. The criticism we make is not of the father of psychoanalysis, one of the great pioneers of human subjectivity. The criticism is of the part of his followers who incur in an absolute model of mind, of a universal psychic apparatus, almost a century later and in opposition to many advances and scientific models.

Two dissents within psychoanalysis are very emblematic for this exemplification. First, that of Wilhem Reich (1897-1957) who, deepening the dynamics of the libido, unveils the energy of the orgone and opens the doors to bioenergetics. Freudian followers saw, and many continue to see, in this Reichian sharpening an aberration and a decharacterisation of the original Freudian theory. The emblematic thing is that Reich literally touches the G-spot of psychoanalytic theory.

The second is Carl Gustav Jung (1875-1961) who, precisely, contrary to a very reductionist interpretation of libido as genitality, opens up to new themes of understanding, such as, for example, the observation of non-causal components in this psychic structuring. These observations lead him to develop the idea of archetypes, a collective model of some individual patterns, and the concept of synchronicity. This concept, elaborated alongside fruitful dialogues with Wolfgang Pauli (1900-1958), known as “the conscience of physics” due to his perfectionism and meticulousness in verifying the epistemology of his own works and those of colleagues.

With Jung, Pauli was no different, which helped the thinker of archetypes to structure his research on the field of quantum physics that was “being born” at that time. Again, emblematic, because Jung ‘sublimates’ psychoanalysis from almost all genital content and is repudiated just as Reich was, who sharpens it around the sexual question. In any case, both, Reich and Jung, were already observing, both as experience and as theoretical elaboration, that the cellar which the master of Vienna opened unveiled more rooms and possibilities than thermodynamics indicated. There was ‘dissipation’ and flow of fluids to areas, fields, regions far beyond those mapped.

By this we wish to say that the influence of Physics in the fields of psychic modelling is latent and evident. Nevertheless, if the criticisms and elaborations of the father of psychoanalysis were predominantly made on his approximation to the project of making a scientific psychology, that is, reductionist and mechanistic. A model that continues to think subjectivity structured in a Cartesian self, drawing upon a plane geometry of these mental spaces. Thinkers such as Rorty developed their criticisms in a paradox, which I have tried to sketch, briefly, in expounding Reich and Jung, or, on the one hand, mechanistic reduction, on the other, the unconscious.

Through mechanistic reduction, Reich proved the orgone, expanding the concept of sexuality and genitality almost to a return to infinity, an amorphous, indefinite substance that permeates all things. On the other hand, entering into the unconscious and “fleeing” from this sexuality, Jung enters into archetypes, the collective unconscious, basically sublimating psychoanalysis. In general, by mechanistic reduction, read both the project of science and thermodynamics (libido, genitality).

Through the unconscious, one understands one of the greatest hermeneutic projects of humanity in presenting this cellar as being a surrealist architecture. Yes, the Freudian construction is of a stunning beauty. He builds it from the Kantian fields, that is, in the synthetic a priori judgements, he decodes an architecture whose language we were illiterate in. If Descartes opens up the dimensions of the cogito. Kant is the one who models our subjectivity. Yet it is Freud who deciphers a cartography of this space and especially touches one, which had many names and representations, and which he called the unconscious. This space, this place, he saw was not local, it could not be.

The hysteria that he examined physiologically, pointwise, genitally, led him to another place. The hysterical patients showed direct improvements, catharses and reliefs upon being touched; later, he develops listening as another form of touch, generating mentally relieving catharses.

More than a scientific project, psychoanalysis has a whole revolutionary character. In speaking of sex, pleasure, desire in a Victorian society, it liberates minds and imaginaries; yet, dialectically, it ends up keeping the address of being merely the place of this speech and not of this act.

The mind-body division that Reich broke, psychoanalysts, in many of their therapeutic processes, safeguard the conservative place of the body. Enjoyment is a mental delight, a male possibility, not very recommendable for women. There is a chauvinist repression within psychoanalysis, today openly combated by women psychoanalysts.

In spite of this, the unfolding of this image, from the concept of transference, is a hygienist posture in which the psychoanalyst safeguards himself from touch, from contact, with the impurities, read, desires of his patients, more precisely, of his female patients. It is through this focus that we unfold the restrictions placed upon the Reichian discoveries as regards touch and the confirmations that energetic dissipation is also corporeal and not merely mental, psychic. Reich showed that the body without armour, male or female, is free, does not respond to family, state, husband, wife. The sexual revolution of the 1960s runs through the Reichian retrieval and rediscovery.

But, returning, Freud, like few, had clarity about these infinite, dystopian, eruptive, oneiric, fantastical, circular spaces. Nonetheless, as a man of his time, he had an obstinacy in doing science. Normal science (Kuhn). In this undertaking, he draws upon the thermodynamics of fluids. Again, nothing more natural.

The criticism is that, from this hermeneutic construction in its most symbolic and significant appeals, psychoanalysis ends up being elevated to a psychiatric, psychological language of linear parametrisation, with the intention of decreeing what is or is not normal. What is or is not illness. Who is imputable or non-imputable. What is madness or sanity.

For our part, we shall insist on the Bachelardian geometric annotations, and here we move towards the final considerations. Considerations that present theoretical and practical conceptions beyond the Euclidean parallels, that is, through a single point it is possible to pass innumerable straight lines, provided we transpose our gaze from the plane to the existential. Or more directly: psychoanalysis became a model of mind, of psyche, that serves as a seminal orientation for other formulations, but will it be the only one? Could it be that all minds, all psychic structures, would have this matrix? It seems to us not. Could this model be falsified, as Popper proposed?

5 FINAL CONSIDERATIONS

It seems evident to us that, by breaking the Cartesian perceptions, one deconstructs Kantian perspectives, and with this the human sciences can narrow richer dialogues with the matrices of the hard sciences.

We do not think of these dialogues under the aegis of the realist, positivist, that took hold of philosophical thought in the middle of the twentieth century. The dialogue that we think of is in the moulds that Bachelard ends up developing, a poetics, an encounter. In this perspective, it seems clear to us that, by deconstructing the cogito, widening Euclidean geometry, we have thousands of possibilities of mental spaces, of other subjectivities, and not only one, as is Kantianly presumed. Various bodies of knowledge have postulated and

presented these new mental spaces, these diverse architectures, not only in their neural, synaptic bases.

But, to touch this point also requires the courage to deal with the part that escapes reason, the part that transcends the demarcation of limits. The part that, even if we close our eyes, makes itself present and life; the nothing.

The nothing is precisely rejected by science and abandoned as an annihilating element. And when, thus, we abandon the nothing, do we not precisely then admit it? But can we speak of admitting something, if we admit nothing? (...) Against this, science must now affirm anew its seriousness and sobriety: it occupies itself solely with beings. The nothing—what else could it be for science but horror and phantasmagoria? If science is right, then one thing is indisputable: science wishes to know nothing of the nothing; this is, after all, the rigorous scientific conception of the nothing. We know of it, inasmuch as of it, of the nothing, we wish to know nothing. Science wishes to know nothing of the nothing. But it is no less certain, too, that, precisely there, where it seeks to express its own essence, it resorts to the nothing. That which it rejects, it takes into consideration. What ambivalent essence reveals itself there? When we reflect on our present existence—as an existence determined by science—we arrive at a paradox. Through this paradox an interrogation has already been developed. The question requires only an adequate formulation: What happens with this nothing? (HEIDEGGER, 1983, p. 36)

“What happens with this nothing” is the interdisciplinary complexity that casts us into the facticity of existence. “What happens with this nothing” is the question that founds philosophical thought, that is, thinking death, dialoguing with the finitude in which we are experientially placed and inserted. It is in the field of finitude that Philosophy embraces Medicine, referring us to existence, in what it has of the most latent and poignant.

It is in existence that Clinical Philosophy is realised. It is in existence that one seeks to welcome the other in their pains, anguishes, fragilities, disencounters, restlessness. It is in this non-place of the loss of health, of fragility, of illness, of death, that life, living well, begins:

We must accept our existence in all its scope; everything, even the unheard-of, must be possible within it. At bottom, this is the only courage demanded of us: to be courageous in the face of what is most strange, most marvellous and most inexplicable among everything we encounter. (RILKE APUD ARANTES, p. 59)

It is in concrete existence, in four-dimensionality, that other existential logics, that other non-Euclidean geometries, make themselves real. In other terms, in mental abstraction, everything can exist and acquire existence. In the consulting room one observes real fears, real prisons of thoughts as dense and concrete as bars of titanium. These mental constructs are not the motive of our criticism, on the contrary.

The Platonic worlds, the formal creations, mental constructivism, are an entity which the therapeutic proposals propose to investigate. But, is it possible to investigate without resorting to terms that disqualify those who perceive in a different way? Is it possible to investigate phenomena without thereby indexing the other? Labelling them, stigmatising them?

Clinical philosophy believes that it is; yet, more than a belief, it is urgent that there be discussion as to upon which theoretical, physical, philosophical bases and frameworks these systems and our way of seeing the other, of reading the world, are supported. Works by innumerable serious researchers throughout the world have been pointing to clearings that surpass the vision and the psychic model that we possessed (GROFF 1995; DAMÁSIO 1996; SACKS 2007; HART 2014). This is to speak of 4 researchers from distinct areas who have been developing works that lead perceptions to other spheres of understanding, invariably humanising people, expanding conceptual and epistemological limits.

Auditory hallucination, notably classified as symptoms of schizophrenia, in the analyses of Oliver Sacks, in the prism of neurology, casts new gazes upon the understanding of the phenomenon. Researchers such as Stanislav and Cristina Groff, still on the same processes of hallucinations, classifications, labellings, diagnoses, also contribute to a more humanised gaze upon the same phenomenon. Under the aegis of another culture, how would this phenomenon be and is it understood? Could it be that there is only one way to interpret the phenomena of the mind? Could it be that the ailments of the brain must be interpreted as a disqualification of the perceptions of subjects? Grof, Hart, Damásio and innumerable others, even within anti-psychiatry (Laing, Cooper, Szasz), point out that they should not.

They reconfigure time-spatial understandings as not being absolute. They make the phenomenological, hermeneutic adjustment, explaining that one thing is the observation of the stars, of the atoms, transforming them into objects. Another thing is the application of this logic to living beings.

In life (bios), in existence, although everything may still be reduced to natural phenomena (physis), the limits of reason need to be placed. And, incredibly, in these epistemological and methodological foundations, these demarcations are not criticised. Human beings, animals, the ecosystem are elevated to the condition of objects, of patients, and in them they remain in spite of their own thinking and perceiving, without ever returning to the condition of subjects, of persons.

The areas of knowledge, in their realist, objectivist metrics, under the parameter of a conception of modern physics, labelled and stigmatised bodies, worlds and minds, divided the human and life into specialities. As much as we may seek a neurologist, or a cardiologist,

or a psychologist, or a clinical philosopher, the person is not only a mind, or a heart, or a psi field, or an intellectual mesh. The person is all of this and several other things, beings, states.

It is this complexity that transcends the Cartesian plane. It is in it, but also beyond it. A beyond that does not make itself metaphysical. At least, not in the traditional, classical sense. All this overflowing, all this figured is Physics, in the sense of being world and of the world. Not a closed world, but an open world in which beings erupt the stipulated, classified, stereotyped, labelled quadrants. They are situated in them, but should not be determined by them.

It is in the flight from these postulates that non-Euclidean geometries widen new paradigms, not only physico-mathematical, but also social, psychic, medical. It opens up to the perception of the person as a whole, even when one of their parts is examined. An opening that directs us to singularity.

To see each being as human (universal) and singular (person), a dimension very well illustrated by Levinas in the figure of the face. An image very dear to CP, because it is philosophy and clinic. It is the field of abstract objects, just as it is the locus of experiential practice. It is in this correlation that it becomes complex thinking (Morin), open (Bachelard), perspectivist (Nietzsche). In going to the world of the other, it strips itself of itself.

The mental movements of the geometer fall silent, in order to approach the world of the other without pre-judgements, conceived and anticipated truths; clinique. The etymological meaning of the word refers to inclining oneself in the direction of the bed. And in this inclination there is the complementarity of philosophical practice, at least of one of them, the clinic.

It is no exaggeration to say that the ethical science of Sócrates, which occupies the centre of the dispute in the Platonic dialogues, could not have been conceived without the model of medicine, to which Sócrates refers so frequently. Medicine was more akin to him than any other branch of human knowledge then known, including mathematics and the natural sciences. (REALE 1990: 115)

The Socratic praxis in its ethical derivations is born of this relationship with medicine, beginning with his mother; a midwife. This praxis is a doing. An aid in the birthing of ideas, an accompanying of the other's process. There was no ultrasound, the sex of the child was not known before it came to light; one suspects, one intuit, one gets it right, but one does not know. These limits have always been clear and intermingled. So that one does not become pregnant for another, neither does one give birth for anyone, yet it is possible to be alongside, assisting in every sense. It is the dimension of care.

The idea of a speculative philosophy is Platonic. The idea of elaborating ideas and getting lost in these elaborations to the point of separating body from mind is the fruit of the Platonic, Apollonian exacerbation. There is no metaphysics more obsessed than thinkers thinking about the thought of what the other thought, without any correlation with the problem, the birth, the pregnancy, the pain, life, light.

These distinctions progressively separated the bodies of knowledge, dividing the person into various quadrants; yet there was a medicine whose practice was to listen. A listening that had no ready-made truths, only approximations to be carried out, and from this encounter with the other to present solutions. Solutions whose meaning was made and given according to the given conditions, again, it was not an a priori. We are speaking of a knowledge that did not fear not knowing, did not fear not having ready-made answers, all the more so because the answers were woven, elaborated in contact.

Obviously the physician knew, but he knew that he did not know and had no fear of this void. Today everyone knows. There is no space for doubts, for not knowing. All specialists are a kind of gods who answer everything, except the central questions: finitude, death. Death is concealed and in the process a normalised, infantile society is generated by not accepting the only concrete limit—in the end, one dies. And one does not know when. At times, not even why. One dies whether life has been brief, or long, whether one has found and given meaning to one's own life, or not.

It is in this place that knowledge becomes authentic, in the attempt to help in meaning, in care. Far from losing hope, it is this finitude that opens the doors to the infinite and to transcendence. Not only in the mystical sphere, but in the sphere of a more possible human doing. Thus the palliative care physician Ana Cláudia tells us:

The physicians prophesy: "There is nothing more to be done." But, I have discovered that this is not true. There may be no treatments available for the illness, but there is much more to be done for the person who has the illness. (...) I think that every physician should be prepared never to abandon their patient, but in medical school we learn only not to abandon their illness. When there are no more treatments for the illness, it is as if we no longer had the conditions to be alongside the patient. (Arantes, 2019, p. 44-45)

Clinical philosophy is also one of these areas that refuses to accept that there is nothing more to be done. It refuses to reduce the person to their diagnoses. It refuses to accept that there is only one form of mind. It refuses not to deal with existence in what it has of life and death. Clinical philosophy inclines towards the person and asks them to tell their historicity.

All this movement takes place because, even being a philosopher, having done a postgraduate course that flirts with anthropology, mathematics, physics, chemistry, neurology, geography, psychiatry, pharmacology; nothing is known about the other before us, this “infinitely other”, this completely unknown.

The universality of the recognition of this other is an objective fact, yet it only becomes existential concreteness when the clinical philosopher empties himself in order to reach the singularity of the one who shows himself. Yes, there are two basic a priori in CP: one is that we cannot do violence to the human being; two, that singularity is the identity of the human being. In this way, one does not possess a privileged access to the other, given by any of the bodies of knowledge, by any universal point. They served until then, but from that encounter onwards, new elaborations are necessary.

Sócrates's mother attended hundreds of births, but all that knowledge was emptied in order to perform the next one. The next birth was singular to the woman giving birth, even if it were the first or tenth child. It was singular to the midwife, because she had never been there in those conditions to perform that event. This phenomenon that is the same, but other. This event that is other, but is repeated as singular, is the tragic component of the eternal return. It is the call to the ethical responsibility of taking responsibility for that moment as if it were going to repeat itself throughout all eternity.

It is in this elaboration that we speak of structure of thought. More than everything that inhabits the sharer (the one who shares their historicity with us) is their existential architecture. An architecture that is edified in consonance with their categorial bases (circumstance, time, place, relationship), transfiguring itself into their modes of being, into their way of acting, responding, dealing with life.

This architectonic structuring does not allow us to determine anything, nor to prejudge anything. Still less to label anyone. This intellectual mesh is fluid, malleable, and knowing this, the clinical philosopher welcomes their sharer. They welcome, understanding that depression may have been, for that person, the salvation of their life, that mood oscillation is the inherent way of that person being in the world, that there is no normal, single way to exist, and that one should not place people in this existential mould.

Existence, in its biological, physical appeals, insists on showing us that everything is singular. Thousands of species, billions of beings, and the existential complexity is that, even being similar, we are singular. So, how to do the human sciences? How to do the medical sciences?

Our wager is for approximation just as in mathematical Physics. It is in the stipulation of non-being that one qualifies being. It is in the flirtation with death that we qualify life. It is

here that the welcoming in the theme of finitude takes place. Yes, one dies, one comes to an end, one ceases, one becomes ill. And, far from this being treated and thought of as depressive, as anguishing, this is the motive of Philosophy. This is the field of existence.

It is in the search for thinking existing, for welcoming existence, for understanding that we do not have a single and absolute model of being, that clinical philosophy dialogues not with physics, mathematics, medicine, but rather with life, with time. In the best ancient and classical tradition, as Galeno reminds us: "He who is a true physician is always a philosopher." Galeno. (REALE 1990: 364).

To dialogue with time should be the primacy of every area of knowledge. To deal with finitude is similar to the Nietzschean experiment in the face of the abyss; at a certain moment, it looks at you and enters into all your spaces. At this hour it is clear the perception that we are not only straight lines, we have curves, thousands of them crossing a single point and drawing complex, marvellous architectures. But, to face both the infinite and finitude demands humility. The humility of knowing. The humility of knowing that one does not know everything, however much one may know. The humility of asking and of accepting answers from other areas. The humility of accepting that time, the infinite, life, are indecipherable, even though we may decode them.

ABSTRACT

Chronic kidney disease, characterised by a set of pathological abnormalities in the kidneys, is characterised by the accumulation of waste in the blood. Tuberculosis in patients with chronic renal insufficiency presents more frequently in the extrapulmonary form, being the predominant infection in the first 12 months of haemodialytic treatment. The aim of this study was to report a singular clinical experience of care for patients diagnosed with infectious spondylodiscitis in the intervertebral disc caused by Mycobacterium tuberculosis and to discuss the impacts generated to the patient when diagnosis is not made at the appropriate time and the implications for nursing. This is a descriptive observational study, an experience report (ER) type, based on theoretical references that discuss the clinical diagnosis and care management for this pathological condition not so present in clinical practice. Adults present gradually with fever, anorexia, weight loss, malaise, fatigue, and most importantly, complaints of chronic pain, low back pain, pain on local palpation, significant limitation of movement and muscle spasms. The presence of spinal cord compression associated with infectious collection reinforces the severity of the condition, in addition to evidencing the importance of early investigation in patients with risk factors. Although manifestations such as pain are frequently present in this group, its trivialisation may result in the neglect of potentially serious conditions. It results in a rare disease, with few structured studies in the literature. It is essential to expand studies and greater discussions on the subject.

Keywords: Spondylodiscitis. Haemodialysis. Extrapulmonary Tuberculosis.

RESUMO

A doença renal crônica, caracterizada por um conjunto de anomalias patológicas nos rins, caracterizada pelo acúmulo de resíduos no sangue. A tuberculose em pacientes com

insuficiência renal crônica apresenta-se mais frequentemente na forma extrapulmonar, sendo a infecção predominante nos primeiros 12 meses de tratamento hemodialítico. O objetivo deste estudo foi relatar uma experiência clínica singular da assistência aos pacientes com diagnóstico de espondilodiscite infecciosa no disco intervertebral pela *Mycobacterium tuberculosis* e discutir os impactos gerados ao paciente quando o diagnóstico não é realizado no tempo adequado e quais as implicações para a enfermagem. Trata-se de um estudo observacional descritivo, tipo relato de experiência (RE), fundamentando-se em referenciais teóricos que discutem o diagnóstico clínico e manejo de cuidados para essa condição patológica não tão presente na prática clínica. Adultos apresentam de forma gradual febre, anorexia, perda de peso, mal-estar, fadiga, e o principal, à queixa de dor crônica, lombalgia, dor à palpação local, limitação importante de movimentação e espasmos musculares. A presença de compressão medular associada à coleção infecciosa reforça a gravidade do quadro, além de evidenciar a importância da investigação precoce em pacientes com fatores de risco. Embora manifestações como a dor sejam frequentemente presentes nesse grupo, sua banalização pode resultar na negligência de condições potencialmente graves. Resulta-se em uma doença rara, com poucos estudos estruturados na literatura. Fundamental a ampliação de estudos e maiores discussões sobre o tema.

RESUMEN

La enfermedad renal crónica, caracterizada por un conjunto de anomalías patológicas en los riñones, se caracteriza por la acumulación de residuos en la sangre. La tuberculosis en pacientes con insuficiencia renal crónica se presenta más frecuentemente en forma extrapulmonar, siendo la infección predominante en los primeros 12 meses del tratamiento de hemodiálisis. El objetivo de este estudio fue reportar una experiencia clínica singular de la atención a pacientes con diagnóstico de espondilodiscitis infecciosa en el disco intervertebral causada por *Mycobacterium tuberculosis* y discutir los impactos generados al paciente cuando el diagnóstico no se realiza en el tiempo adecuado y cuáles son las implicaciones para enfermería. Se trata de un estudio observacional descriptivo, de tipo informe de experiencia (IE), fundamentado en referencias teóricas que discuten el diagnóstico clínico y el manejo de cuidados para esta condición patológica no tan presente en la práctica clínica. Los adultos presentan gradualmente fiebre, anorexia, pérdida de peso, malestar, fatiga, y lo más importante, quejas de dolor crónico, dolor lumbar, dolor a la palpación local, limitación significativa del movimiento y espasmos musculares. La presencia de compresión de la médula espinal asociada con colección infecciosa refuerza la gravedad de la condición, además de evidenciar la importancia de la investigación temprana en pacientes con factores de riesgo. Aunque manifestaciones como el dolor estén frecuentemente presentes en este grupo, su trivialización puede resultar en la negligencia de condiciones potencialmente graves. Resulta en una enfermedad rara, con pocos estudios estructurados en la literatura. Es esencial ampliar los estudios y mayores discusiones sobre el tema.

1 INTRODUCTION

Chronic Kidney Disease (CKD) is characterised by a set of pathological abnormalities in the kidneys, characterised by the accumulation of waste in the blood. Progressive disease of debilitating and terminal evolution, its aetiology develops from three main factors: senescence, arterial hypertension and Diabetes Mellitus, and once developed, it can still evolve into several other diseases (Ribeiro, 2019).

It is estimated that approximately 850 million people worldwide suffer from kidney disease, with the majority living in low-income countries. A large portion of the population still does not have adequate access to diagnosis, prevention or treatment of this condition (Jager *et al.*, 2019). By 2040, the disease could be the fifth leading cause of death in the world (Foreman *et al.*, 2018).

Patients undergoing haemodialysis (HD) have a risk of developing tuberculosis (TB) 6.9 to 52.5 times higher than the general population, this is because CKD patients are immunosuppressed, as uraemia is associated with reduced expression of glycoprotein costimulators on antigen-presenting cells. There is malnutrition, zinc deficiency, vitamin D, in addition to impaired phagocytic, migratory and chemotactic function, resulting in lower capacity to eliminate microorganisms (Fonseca *et al.*, 2013; Lundin *et al.*, 1979; Santos *et al.*, 2025).

The authors associate the presence of bone tuberculosis in patients with CKD with immune dysfunction, characterised by relative immunosuppression and alterations in the inflammatory response. Such a condition may imply a higher risk of unfavourable evolution, greater morbidity, diagnostic delay (often attributed to the renal conditions themselves) and greater complexity in pharmacological management, especially due to the increased risk of drug toxicity (Ferreira *et al.*, 2021).

2 THEORETICAL BACKGROUND

According to *Guidelines Kidney Disease: Improving Global Outcomes* (KDIGO), CKD is defined as a structural or functional alteration in the kidney for at least 3 months, causing implications for health. It is classified through glomerular filtration rate (GFR) in stage V, less than 15 ml/min/1.73m² and albumin levels in the body (*Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease*, 2024).

Kidney disease increases the risk of mortality, morbidity and disability, as well as reducing quality of life. It brings significant economic consequences for individuals and health systems, as well as causing significant environmental impacts (Francis *et al.*, 2024).

CKD is considered the third fastest-growing cause of death in the world, being the only one among non-communicable chronic diseases showing a continuous increase in age-adjusted mortality (Wang *et al.*, 2016).

Given this reality, the patient undergoing renal replacement therapy by HD faces changes in their daily life, encompassing social, occupational, dietary and sexual life aspects which directly impact their physical and mental integrity. Such changes contribute to increased vulnerability and to the impairment of quality of life (Ferreira; Silva Filho, 2011; Francis *et al.*, 2024).

With this, frailty syndrome stands out, a condition of clinical and multifactorial nature, characterised by greater susceptibility to stressors, associated with reduction of physiological reserve, muscle strength and functional capacity. As a consequence, there is greater risk of dependence, hospitalisations, functional decline, as well as increased morbidity and mortality (Gesualdo *et al.*, 2020).

The World Health Organization (WHO) points out that TB has returned to its position as the leading cause of death from an infectious agent in the world, despite being a preventable and treatable disease, even surpassing the mortality rates previously attributed to Covid-19 (WHO, 2025).

Between 2022 and 2023, an increase of 3% in mortality from the disease was observed in Brazil, with the rate reaching 2.8 deaths per 100,000 inhabitants in 2023. In 2024, newly registered cases increased by 21%, totalling 84,308 notifications (Brasil, 2025).

Looking at developing countries, the diagnosis of extrapulmonary tuberculosis faces significant challenges, mainly related to limited infrastructure of health services and technical lack of knowledge. Adding to this is the presence of non-specific clinical signs, which vary according to the anatomical location of the disease, as well as the frequent absence of concomitant pulmonary involvement. The unavailability or difficulty of access to specific examinations, such as bacilloscopy, biopsy and molecular and bacteriological tests, contributes to diagnostic delays, favouring underdiagnosis and underreporting of cases (Farer; Lowell; Meador, 1979; Florencia, 2024; Queiroz, 2008).

Within this panorama, tuberculous spondylodiscitis (TS) emerges as a relevant extrapulmonary manifestation. It is characterised as an infectious process affecting the spine, affecting vertebral bodies and adjacent paravertebral structures, which can lead to the formation of abscesses and bone involvement (Conti *et al.*, 2025a).

The origin of the infection can be classified as endogenous or exogenous. The endogenous form is preceded by a primary infectious focus distant from the vertebral bodies, with haematogenous dissemination and subsequent colonisation of the spine. Frequently, at

the time of diagnosis of spondylodiscitis, the initial focus is no longer identified. The exogenous form is related to invasive procedures performed in regions close to the spine (Herren *et al.*, 2017).

It is a condition of high morbidity, associated with important neurological sequelae, frequently accompanied by chronic low back or thoracic pain. Despite being infrequent, its incidence has increased in recent decades, due to the increase in life expectancy, the greater prevalence of chronic diseases, the use of intravenous drugs, immunosuppression, prolonged use of corticosteroids, infection with human immunodeficiency virus (HIV), renal or hepatic failure, as well as the performance of invasive procedures and surgeries (Massabni; Bonini, 2019; Matos Queiroz; Alves De Assis Pereira; Figueiredo, 2013; Ribeira *et al.*, 2008).

The disease affects, more frequently, socially vulnerable populations, which may contribute to its neglect in research and therapeutic aspects. Underdiagnosis favours the occurrence of irreversible neurological sequelae and implies high-cost treatments, including prolonged antibiotic therapy, long periods of hospital stay, invasive investigations and, in some cases, surgical approach (Ferreira *et al.*, 2021).

Clinically, the evolution of TS is marked by a mixture of neurological, systemic and orthopaedic signs and symptoms, which must be investigated. The onset is usually gradual, a slowly progressing disease, the time between appearance of symptoms and diagnosis is approximately 12 months (Shanmuganathan *et al.*, 2023).

TB in patients with chronic renal failure presents more frequently in the extrapulmonary form, being the predominant infection in the first 12 months of haemodialytic treatment. In the Sant *et al.* study (2004), 1,266 patients with CKD under HD in the municipality of Rio de Janeiro were analysed. Tuberculosis was diagnosed in 2.6% (n=30) of individuals. When compared to the general population of Rio de Janeiro, these patients presented significantly higher prevalence of the disease, with a relative risk of 19.68. There was also a significant predominance of the extrapulmonary form (63.3%; n=19) in relation to the pulmonary form 33.3% (n=11).

A study conducted in Turkey (Turunc *et al.*, 2007) aiming to compare the clinical, laboratory and radiological characteristics of TS, brucellous and pyogenic demonstrated that, among the 75 patients evaluated, 13 presented TS. In this group, a significantly higher frequency of CKD was observed, as well as greater prevalence of general symptoms and manifestations, such as weight loss, night sweats and general malaise.

The systematic review with meta-analysis of (Alemu *et al.*, 2022) was, to date, the first to analyse data from scientific electronic databases, with publications between 2000 and

2021. The study identified 104 observational studies conducted in 32 countries, totalling 1,548,744 patients with CKD, of which 12,189 had TB. The pooled incidence of TB in patients with CKD was estimated at 3,718 cases per 100,000 individuals.

The relevance of the extrapulmonary form of the disease is highlighted, whose incidence was described in 73 studies, with values varying from 50 cases per 100,000 individuals. In the Brazilian context, the number of studies is still limited, with only seven studies identified, with a total of 294 cases identified.

TS, especially when associated with comorbidities such as chronic kidney disease, constitutes a picture of high clinical complexity, marked by persistent pain, progressive functional limitations and greater vulnerability (Alemu *et al.*, 2022)

TB in chronic renal patients has relevant impact at global level, however, still has limitation of studies in the Brazilian context restricting a more thorough understanding of clinical manifestations, which hinder early recognition and contribute to diagnostic delays and worsening of disease evolution and adequate clinical management. Furthermore, tuberculosis should not be understood as a condition restricted to populations in vulnerable situations, but as a possible reality in the daily reality of health services, being liable to be present in any care setting (Luczynski *et al.*, 2023).

This study aims to report a singular clinical experience of the author in the care of patients diagnosed with infectious spondylodiscitis in the intervertebral disc caused by *Mycobacterium tuberculosis*, where the evolutions were marked by infectious complications, with surgical re-approaches and acquired sequelae. This report seeks to add value to the literature in the field of nursing, by addressing the challenges of nursing in the face of signs and symptoms, loss of functionality and pain management during the evolution of the disease.

The importance of nursing care in the systematic assessment of pain, in continuous clinical monitoring and in the implementation of interventions aimed at maintaining functionality and preventing complications arising from immobility is highlighted.

3 METHODOLOGY

This study is a descriptive observational study, an experience report (ER) type experienced by the author. As it is purely about the author's own experience, without patient identification and without collection of primary data, this study was not submitted to the ethics and research committee. Ethical principles were respected, ensuring anonymity, confidentiality and secrecy of information.

The ER in academic context aims to record of experiences lived from research, teaching, university extension projects, among others, not necessarily, an academic research report (Mussi; Flores; Almeida, 2021).

The context in which the experience is narrated takes place in an outpatient haemodialysis clinic in the interior of São Paulo state. The reflections on the routine of the institution arose from the author's experience as a nursing graduate in the observation and care of chronic renal patients. The experience was described separately through thematic axes, defined from the most relevant aspects observed, organised in: the routine, the clinical manifestations and the late diagnosis. Furthermore, consultations are carried out in the literature and bibliographic sources to support such observations and lived experience.

The theoretical reference was obtained through studies, systematic reviews, master's dissertations, qualitative research, clinical practice guides that had the full text, in Portuguese and English, with a focus on the last 15 years, through the databases of the BVS (Virtual Health Library), SciELO (*Scientific Electronic Library Online*), MEDLINE (*Medical Literature Analysis and Retrieval System Online*), BDENF (Nursing Database) and LILACS (Latin American and Caribbean Literature in Health Sciences) and CAPES (Coordination for the Improvement of Higher Education Personnel) portal using Descriptors in Health Sciences (DeCS) interspersed with Boolean operators, in Portuguese and English: "Spondylodiscitis AND haemodialysis AND Extrapulmonary tuberculosis".

4 RESULTS

4.1 ROUTINE

The viability of this experience report occurred through the experience of the nursing graduate, from a private university, in spontaneously accompanying the routine service in an outpatient clinic, in the interior of São Paulo state, where they provide care for patients with chronic renal insufficiency dependent on renal replacement therapy, haemodialysis, for the public served by the single health system (SUS), during the period from January 2019 to July 2021.

At the clinic, patients were attended on average three times a week, with a duration of four hours each session, operating Monday to Saturday, with these divided into three shifts during the day, divided into 4 therapy rooms.

Patients were submitted to this therapeutic modality through vascular access, with the presence of the Shiley catheter (emergency situations/temporary), permacath (long duration), or the arteriovenous fistula (AVF) considered the gold standard in choice for chronic patients (Harduin *et al.*, 2023). This vascular access is connected to an invasive machine, which

promotes the filtering of the accumulation of waste in the blood, which the kidneys are unable to eliminate. Patients were subjected each session to pre and post therapy weighing, in order to monitor weight variation and quantify ultrafiltration (UF), aiming at the assessment of interdialytic weight gain and the establishment of targets to achieve dry weight. When patients reached values exceeding weight/liquid, the team itself took responsibility for programming and preparing extra sessions on alternate days for more frequent therapy with less intensity, for the purpose of eliminating the excesses. In interactions with these patients, one identified a maintenance of survival, even with low indices of quality of life (SBN, 2023).

Monthly, patients underwent laboratory examination collection for evaluation of biological markers and reassessment of general status. The exams are calcium, creatinine, phosphorus, glucose, haematocrit, haemoglobin, potassium, sodium, TGP, urea pre and post session, monitoring is performed through these monthly exams in addition to those scheduled semi-annually and annually, according to RDC 154 guidelines. The objective is to detect complications associated with the condition of therapy, such as anaemia, iron deficiency, vitamin B12.

During the substitute therapy sessions, the team creates a strong bond with the patient, discovering and understanding the context of life in which they are inserted, thus knowing the physical, psychological, emotional and social limitations and needs. The patient throughout the therapies created a high bond with the professionals, the environment, the management of care and even among the fellow dialysis colleagues. In the vast majority, patients of low purchasing power, from neighbouring cities, came to the clinic through municipal council transportation, presenting fragility also in the needs of caregivers, who needed to wait for the hours of dialysis, in order to be able to return to their home city.

4.2 CLINICAL MANIFESTATIONS

A progressive impairment of motor function was identified in patients undergoing substitute therapy, which, over sessions and years, becomes increasingly impaired, with a worse prognosis of the clinical picture (Pires *et al.*, 2017).

As the days progressed accompanying the routine, one perceived a painful and long-lasting treatment which, along with the evolution of the disease, has greater complications, being able to highlight: fatigue, nausea, depression, hypotension, muscle spasms, blood clots, infections and allergic reactions (Bennett *et al.*, 2025).

In accordance with the literature, a high index of infectious complications was observed, which could be caused by bacteria, fungi or viruses. Patients presented difficulties in coping with long-duration vascular accesses, care in handling and necessary maintenance,

and in addition, the team has the responsibility with preventive measures, such as hand hygiene and care towards accesses (Katneni; Hedayati, 2007).

During the sessions, some patients presented an increase in pain score, along with other signs and symptoms, the nurse and nursing technicians were the professionals who welcomed, classified and provided care for pain management, which in some cases was not enough to stop the pain crisis. Together with the multidisciplinary team, it was necessary to continue investigations to improve this acute condition. However, during this time the persistence and advancement of the picture was noted, even though it could be influenced by the underlying pathology, there is still a need and obligation for further investigations and continuous reassessments of the picture. In practice, the crisis is often treated as isolated cases, administering intravenous drugs to improve the pain score, showing a generic context, which does not always help to guide the construction of clinical reasoning (Mehrotra *et al.*, 2023).

Patients with chronic pain in haemodialysis are attributed as expected manifestations within the base conditions, thus resulting in a number of patients with underestimated adjacent diseases that cause greater damage to the patient's quality of life (Tavares *et al.*, 2020).

In this entirety, the occurrence of complications associated with bone tuberculosis in immunosuppressed patients, characterised by atypical signs and symptoms and slow evolution, was detected. The infection was related to haematogenous dissemination, resulting in vertebral involvement (Lopes *et al.*, 2023).

4.3 LATE DIAGNOSIS

Delay in investigation leads patients to seek emergency care services, where due to urgency and disease evolution it is necessary to check through magnetic resonance imaging (MRI) and computed tomography (CT) the reason for 'sudden' paraplegia.

Suspicious should be raised by the team at the beginning of investigations, laboratory exams should be analysed to guide the process, some studies bring as an initial follow-up the analysis of erythrocyte sedimentation rate (ESR) and C-reactive protein (CRP) values, and for better evaluations the use of radiographic exams of the vertebral body, with magnetic resonance imaging being the best option to identify bone distribution (Rodrigues; Bortoletto; Matsumoto, 2010; Santos *et al.*, 2023a).

The absence of diagnosis in a timely manner contributed to the worsening of the clinical picture, with serious outcomes, long hospitalisations and surgical approach that further compromises the vertebra, in advanced cases there is spinal cord compression by

collection, as well as the emergence of other associated complications that directly impact the quality and maintenance of life. These interventions could have been uncomplicated and non-invasive if the diagnosis were not so late, in this case 10 months of signs and symptoms without adequate conduct, since the patient is welcomed and monitored by the haemodialysis team (Schettino; Carelli; Barbosa, 2010; Tavares *et al.*, 2021).

Complications such as kyphosis, permanent neurological deficits, vertebral canal stenosis, can be reduced with appropriate therapy (Anjos *et al.*, 2024).

Such factors directly impact the prognosis of patients, and may even lead to exclusion from the transplant queue, which in the context of this patient is a setback in a process of liberation from the haemodialysis machine.

TB in chronic renal patients may be more common than the literature brings us, as there is underreporting of cases. This experience in the scenario of increasing morbidity and decline in quality of life, makes professionals not recognise such patterns of pain and functional dependence.

The care experience allowed us to recognise that investigation, early identification, pain pattern are essential both for complications of low to high scale, and that when this conduct is not carried out, the morbidity of patients increases along with mortality.

5 DISCUSSION

Tuberculosis remains an important public health issue worldwide, with the pulmonary form being the most frequent and widely studied, accounting for approximately 95% of cases, whilst extrapulmonary manifestations have scarce and limited national content, with involvement of the thoracolumbar region being one of the main regions of musculoskeletal tissue affected (Rodrigues; Bortoletto; Matsumoto, 2010). The dissemination of the disease can occur via haematogenous, lymphatic or by contiguity from adjacent infectious foci (Rodrigues; Bortoletto; Matsumoto, 2010).

Immunosuppression is defined as the deficiency that the immune system presents in response to aggressive agents; the acquired form (in the case of chronic renal) is due to an external factor that affects the immune system (Garcia *et al.*, 2004). Bloodstream infection in chronic renal patients is one of the main causes of hospitalisation and mortality in this group of patients, after cardiovascular diseases (Harduin *et al.*, 2023).

A retrospective study by Menis *et al.* (2022) analysed 431 patients, over a 5-year period (2016-2021), notifications of bloodstream infection in the haemodialysis sector. Patients using permacath presented 64% notifications of bloodstream infection (BSI),

followed by 34% in cases using double lumen catheter and 1% in patients using arteriovenous fistula (AVF).

Another study by Weldetensae (*et al.*, 2023) from 2016 to 2022, with 353 patients identified 38.2% of catheter-related BSI, with an incidence of 7.74 episodes per 1,000 device-days, the study also revealed that the second main reason for catheter removal was 25.6%, due to infection, second only to renal recovery.

The signs and symptoms of the patient with BSI may be: chills, fever, hypotension, tachycardia, phlogistic signs and even secretions at the insertion site (Andrade; Garcia; Cruz, 2025). The presence of infections evidences the potential for dissemination of infectious agents via haematogenous route. This propagation enables the involvement of secondary sites, with parallel complications such as pain, dyspnoea, low back pain, bone and joint pain being common in patients undergoing haemodialysis (Ribeiro; Jorge; Queiroz, 2020).

According to the World Health Organization, risk factors for tuberculosis are considered to be contact with an active carrier, immunosuppression by cancer, HD, HIV, drug use, Diabetes Mellitus, renal failure, malnutrition (WHO, 2011).

In the case of tuberculosis, the agent *Mycobacterium tuberculosis* can disseminate via haematogenous route, reaching bone and joint structures, characterising the extrapulmonary form of the disease. It manifests itself in various ways, is accompanied by fever, night sweats, spinal rigidity, muscle weakness and alterations in the lower limbs of sensory aspect (Santos *et al.*, 2023b).

Leal and colleagues (Leal *et al.*, 2003) studied 24 patients between one and 78 years old with septic spondylodiscitis. It was identified in their study that 8.3% achieved improvement without complications, while there were 12.5% deaths and among the cure (79.2%) obtained 8.3% neurological deficit. He further reinforces that the factors related to haematogenous spondylodiscitis are: diabetes mellitus, rheumatoid arthritis, use of corticosteroids, intravenous drugs, history of infections, between 20 to 82% of cases, CKD undergoing HD.

Collaborating with this study, the report of Zanatelli *et al.* (Zanatelli; Zanatelli; Galassi, 2013) demonstrates the difficulty in identifying and treating the patient, which at the beginning was interpreted as ischaemic stroke (AVEI), with worsening of the picture and sensory level, was submitted to MRI of the dorsal spine, identifying inflammatory process in disc D7/D8 extending to disc reduction and spinal cord compression. With diagnosis dependent on medical suspicion, delay in discovery and appropriate therapy collaborates for worse outcomes.

Adults present gradually with fever, anorexia, weight loss, malaise, fatigue, and most importantly, complaint of chronic pain in the back, low back pain, pain on local palpation, significant limitation of movement and muscle spasms (Matos Queiroz; Alves De Assis Pereira; Figueiredo, 2013).

A retrospective study by (Ribeira *et al.*, 2008) conducted at Coimbra Hospital Centre, between 2002 and 2007 reviewing clinical records of 28 patients diagnosed with spondylodiscitis observed that the average length of hospital stay was 76.6 days (SD $\pm$ 34.2); most frequent clinical manifestations were pain in (92%) and average duration of pain until diagnosis was assessed in 10 patients and lasted an average of 95 days. Of the patients who presented neurological injury, complete paraplegia in two and incomplete paraplegia in eight patients.

The basis of therapy is anti-TB therapy, with more than 90% success of cases, MS guides the same institution of pulmonary tuberculosis, maintaining the surgical approach to specific cases with precise indications. The recommended scheme is Rifampicin, Isoniazid and Pyrazinamide and Ethambutol (RHZE), being the basic scheme RHZE for 2 months (intensive phase) and RH for 10 months (maintenance phase) (Ministry of Health, 2025).

Corroborating with this experience, the case report of Fonseca *et al.* (2022) presents a patient admitted with a picture of paraplegia, associated with infectious spondylodiscitis and presence of thoracic collection with spinal cord compression. Despite being a young patient, surgical intervention was considered high-risk, with the possibility of maintaining permanent neurological sequelae, exceeding the potential benefits. Given this, it was decided to opt for drug therapy; however, the patient evolved with profound areflexia, muscle strength grade 0 and loss of sensitivity in the lower limbs. These findings evidence the severity of neurological involvement associated with disease progression, especially when diagnosis and intervention occur late.

Comparing with the mentioned study, similar clinical evolution is observed to the present experience, characterised by persistent pain, associated with non-specific signs and symptoms, which contributed to delay in the recognition of the picture and progression of the infection, culminating in the development of serious neurological complications. The presence of spinal cord compression associated with infectious collection reinforces the severity of the condition, as well as evidencing the importance of early investigation in patients with risk factors.

A retrospective study conducted in northern Italy, with data collection between January 2010 and December 2023, analysed the characteristics of infectious spondylodiscitis over 14 years. It was observed that 53 cases (54.1%) had pyogenic bacterial aetiology, 10 cases

(10.2%) were attributed to *Mycobacterium tuberculosis* and 35 (35.7%) presented unknown aetiology. Among patients with TS, 30% were carriers of diabetes mellitus and 20% of CKD. The most frequent symptom was low back pain (90%), followed by fever (90%), whilst only 20% presented neurological signs. It is noteworthy that, in this group, all cases had an initially undetermined origin, with an average time to diagnosis of 35 days (16–60 days), as opposed to other studies, this average time was relatively low (Conti *et al.*, 2025b).

In the experience lived, there was no establishment of diagnosis in a timely manner, even after multiple investigations. The identification of the picture occurred only in the face of a neurological emergency, when imaging exams evidenced spinal cord compression, already associated with the risk of serious complications, such as meningitis. It is noteworthy that the presence of non-specific symptoms favours misinterpretations, frequently attributed to less serious conditions, which contributes to diagnostic delay and disease progression.

6 FINAL CONSIDERATIONS

In this practical experience in tertiary care and with high-complexity care, it was identified how much patients undergoing haemodialysis require comprehensive and holistic care, that adjacent diseases can further compromise the patients' lives. The therapeutic interventions offered to patients undergoing haemodialysis do not guarantee the recovery of quality of life, but rather its maintenance. This experience showed how much patients are fragilised in levels of education, housing, income, understanding of their own disease and in their own self-care. Patients spend long periods subjected to the machine, without effectively understanding their disease, its alterations, the morbidities and their probable risks. The team becomes essential in the process of health education, in physical and emotional support. In accordance with the experience, patients consider treatment anguishing, suffering and painful not only due to the disease, but due to the therapy that becomes the only form of life maintenance. Such observations promoted greater sensitivity and drive to unearth in the literature (mainly national) such atypical findings and that deserve to reach larger proportions, since many of the morbidities presented are masked by the underlying disease. The most important thing is that these are not isolated cases, but sporadically one noticed patients with similar characteristics, but that after discussions, observations, lived experiences and understanding of the severity by the multidisciplinary team, began to be conducted in a differentiated manner, thinking and acting in a more active way. Thus, although this experience represents a small contribution given the complexity of the subject, it is hoped that the lived experiences reported here may encourage new perspectives on patients with similar presentations, stimulating clinical investigation, multidisciplinary action and the

production of scientific knowledge, in order to favour more timely diagnoses and care that is increasingly qualified and humanised.

This study brings as a theme a rare disease, with few structured studies in the literature, being essential to expand studies and greater discussions on the subject. When there is a scarcity of literature to support conduct and care, the difficulty arises in understanding and managing the symptomatology that initially suggest victimisation of the patient. The attention of the multidisciplinary team is important, mainly nursing, being the category that has continuous contact with the patient during haemodialysis sessions, occupying a position of greater coexistence, acting as an important facilitator in the early identification of clinical alterations and in guiding diagnostic investigation.

Finally, it is emphasised that treatment, although often perceived as complex, is, in reality, accessible and well established and made available in the Single Health System. However, therapeutic success does not depend only on the availability of treatment, but, above all, on the careful and qualified view of the professional. In this sense, early diagnosis becomes essential to prevent disease progression, preventing neurological complications, the need for surgical interventions and even fatal outcomes.

ABSTRACT

Dental posts are materials used to provide load support and sustenance to the remaining tooth structure during oral rehabilitation. Their application is usually related to situations in which significant loss of tooth structure occurs, being employed after endodontic treatment, since the post is inserted within the root canal. In this regard, fibre posts are gaining prominence in the market owing to their excellent mechanical and structural properties. The present research aims to compare the fracture resistance of both the glass fibre post and the quartz fibre post in posterior teeth. Searches were carried out in the electronic databases Scielo, PubMed, ScienceDirect and Scopus between the years 2016 and 2026. A total of 1,353 records were found and only 5 articles were selected for meeting the requirements of the research in question. The quartz fibre post has high mechanical resistance, in addition to an elasticity modulus similar to that of dentine, better light transmission, as well as fibre density and orientation providing better force distribution. The glass fibre post, in turn, has high mechanical resistance, an elasticity modulus close to that of dentine, better adhesiveness and homogeneity with the resin. In comparative terms, the results related to

RESUMO

Pinos odontológicos são materiais utilizados para proporcionar suporte de carga e sustentação aos remanescentes dentários durante a reabilitação oral. Habitualmente, sua aplicação está relacionada quando ocorre perda significativa da estrutura dentária, sendo empregada posteriormente ao tratamento endodôntico, pois o pino tem sua inserção dentro do canal radicular. Nesse sentido, os pinos de fibra estão ganhando notoriedade no mercado devido às suas excelentes propriedades mecânicas e estruturais. A presente pesquisa tem por objetivo comparar a resistência à fratura tanto do pino de fibra de vidro quanto do pino de fibra de quartzo em dentes posteriores. Realizou-se buscas nas bases de dados eletrônicos Scielo, PubMed, ScienceDirect e Scopus entre os anos de 2016 a 2026. Foram encontrados 1353 e apenas 5 artigos foram selecionados por cumprirem os requisitos da pesquisa em questão. O pino de fibra de quartzo possui uma resistência mecânica elevada, além de módulo de elasticidade semelhante ao da dentina, melhor transmissão da luz, além da densidade e orientação das fibras com uma melhor distribuição das forças. Já o pino de fibra de vidro, possui resistência mecânica elevada, módulo de elasticidade próximo ao da dentina, melhor adesividade e homogeneidade com a resina. De maneira comparativa, os resultados relacionados a resistência à fratura são satisfatórios para ambos os pinos, sendo o pino de quartzo ligeiramente melhor no quesito resistência, entretanto, não foi evidenciado uma diferença significativa entre os pinos.

RESUMEN

Las espigas dentales son materiales utilizados para proporcionar soporte de carga y sostén a los remanentes dentarios durante la rehabilitación oral. Habitualmente, su aplicación está relacionada con situaciones en las que ocurre una pérdida significativa de la estructura dentaria, empleándose posteriormente al tratamiento endodóntico, ya que la espiga se inserta dentro del conducto radicular. En este sentido, las espigas de fibra están ganando notoriedad en el mercado debido a sus excelentes propiedades mecánicas y estructurales. La presente investigación tiene por objetivo comparar la resistencia a la fractura tanto de la espiga de fibra de vidrio como de la espiga de fibra de cuarzo en dientes posteriores. Se realizaron búsquedas en las bases de datos electrónicas Scielo, PubMed, ScienceDirect y Scopus entre los años 2016 y 2026. Se encontraron 1353 registros y solo 5 artículos fueron seleccionados por cumplir los requisitos de la investigación en cuestión. La espiga de fibra de cuarzo posee una resistencia mecánica elevada, además de un módulo de elasticidad similar al de la dentina, mejor transmisión de la luz, así como la densidad y orientación de las fibras con una mejor distribución de las fuerzas. La espiga de fibra de vidrio, por su parte, posee resistencia mecánica elevada, módulo de elasticidad próximo al de la dentina, mejor adhesividad y homogeneidad con la resina. De manera comparativa, los resultados relacionados con la resistencia a la fractura son satisfactorios para ambas espigas, siendo la espiga de cuarzo ligeramente mejor en cuanto a resistencia; sin embargo, no se evidenció una diferencia significativa entre las espigas.

1 INTRODUCTION

Dentistry is the science responsible for the study of the stomatognathic system, analysing its constituent parts such as the mouth, face, joints, jaws, gingiva and tooth. In the oral cavity the dental arch plays a fundamental role, with each tooth being responsible for performing specific functions, which are related to phonetics, aesthetics, mastication and balance in dental occlusion. Posterior teeth (premolars and molars) are known for receiving loads and distributing forces, promoting harmony during mastication (Keçec; Heidemann; Kurnaz, 2016).

In view of this, tooth loss constitutes a problem that must be observed carefully, since the absence of certain teeth, especially posterior ones, may lead to disarrangement of the occlusion and negatively stimulate future problems. Among the “villains” that promote loss in the dentition is caries, a multifactorial and biofilm-dependent disease, which provides extensive tooth destruction. In the rehabilitative scope, from the moment the tooth has total crown impairment, but there being little coronal remnant (around 2 mm), direct rehabilitation with composite resin is no longer viable, owing to the constant fractures in this region (Amritha *et al.*, 2023).

The use of dental posts gained prominence in contemporary oral rehabilitation as a reinforcement structure, which would reduce the risk of dental fracture, it being important to point out that the dental element needs to be endodontically treated to obtain success in the procedure. In former times the process of restoring the dentition was more rudimentary, with the use of gold/metallic alloys and the soldering of crowns with multiple retentions being some of the alternatives proposed during the period (Batra *et al.*, 2022).

With the evolution of dentistry the cast metal core became indispensable for dental treatments, being usable both for anterior and posterior teeth. These cores have positive characteristics such as better area filling, versatility and hardness. However, they present a risk of corrosion, chromatic alterations, longer working time, an elasticity modulus extremely different from that of dentine, being more susceptible to vertical fracture of the tooth. These are disadvantages that accompany the use of this metallic post. Currently, the oral rehabilitation of endodontically treated teeth, with coronal remnant, is performed through the use of fibre posts. The main dental fibre posts are the glass fibre post and the quartz fibre post (Batra *et al.*, 2022).

The former is known in the market for presenting high mechanical resistance, an elasticity modulus similar to that of dentine, better adhesiveness and homogeneity with the resin, in addition to having no risk of corrosion; another important point to highlight is its low cost and high longevity. However, the glass fibre post, in some cases, requires adaptation

within the root, with the anatomisation of the glass fibre post with resin being an alternative that allows its use in these specific situations (Batra *et al.*, 2022; Amritha *et al.* 2023; Meimandinezhad *et al.*, 2023).

The latter, the quartz fibre post, has high mechanical resistance, in addition to an elasticity modulus also similar to that of dentine, better light transmission, as well as the density and orientation of the fibres with better force distribution. The negative points of using the quartz post in question are its lower adaptation in canals with irregular anatomy, alteration of mechanical property if the surface is not well treated, and the fact that good adhesiveness is related to the correct use of the technique (Meimandinezhad *et al.*, 2023).

It is worth pointing out that there must be a specific preparation for the cementation of these fibre posts within the root canal; the preparation of a canal that creates anchorage is recommended, the total length of the remnant being 2/3, with it being necessary to leave 4 mm of restorative material at the apex of the tooth, in addition to an adequate surface treatment and the use of conventional resin cement to provide better adhesiveness (Amritha *et al.*, 2023; Meimandinezhad *et al.*, 2023; Wag *et al.*, 2024).

The choice of theme: use of glass fibre and quartz fibre posts in the rehabilitation of endodontically treated posterior teeth, is justified by its current relevance, since fibre posts are widely used in the dental market and treatment alternatives are necessary for the development of dentistry (Meimandinezhad *et al.*, 2023).

And the present work aims to compare the fracture resistance of both the glass fibre post and the quartz fibre post in endodontically treated posterior teeth.

2 METHODOLOGY

This research will be based on the descriptive study of the integrative literature review type. Hassunuma *et al.* (2024) defines integrative review as “a powerful research tool. Its methodology allows a broad review of the literature and the creation of new knowledge from the reflection of the researcher based on the collection, extraction and analysis of pre-existing data.”

The present integrative review will allow the detailed and comparative analysis of the use of different fibre posts, namely glass fibre and quartz fibre, with a focus on the assessment of fracture resistance in rehabilitated posterior teeth, so that this study will be conceived and outlined following the stages expressed in the study by Souza, Silva and Carvalho (2010), who recommend the structure of the integrative review in the following six stages:

Initially, the 1st stage for preparing the integrative review will be carried out, whose purpose is the elaboration of the guiding question that will be used as the central point of the research, which must be answered at the end of the study.

Subsequently, the 2nd stage of the methodology, called search or sampling in the literature, will be carried out, whose purpose is the search for data on the basic theme of the main subject, providing a broad and diversified search. From this perspective, it is necessary to seek reliable information in the various digital scientific libraries, through the choice of criteria that correctly ensure the inclusion and exclusion of the articles found, in addition to the direct link between the use of the article and its correlation with the guiding question.

Soon after, the 3rd stage of the integrative review will be executed, defined as data collection, in which the researcher will select the data from the articles. It is essential to develop methods that ensure the extraction of the relevant data, guaranteeing precision and mitigating the risk of bias in the research, taking into consideration the inclusion of the definition of the subjects, methodology, sample size, variables and underlying concepts employed.

Next, the 4th stage of the work will be developed, in which the critical analysis of the included studies will occur, weighing the rigour and the characteristics of each study, using a classification of evidence; to define a hierarchy for these highlighted forms of evidence, an outline of the study is proposed, through levelling, that is, the study is divided into strata. In this interim, the first level of scientific evidence is located at the top of the pyramid, which presents systematic review studies and meta-analysis of multiple controlled and randomised clinical studies. Moving towards the base of the pyramid, the second level demonstrates the evidence obtained in individual studies with an experimental design. The third level demonstrates the evidence from quasi-experimental studies. The fourth level demonstrates the evidence from descriptive (non-experimental) studies or those with a qualitative approach. The fifth level demonstrates the evidence from case or experience reports and the sixth level demonstrates the evidence based on expert opinions.

Subsequently, the 5th stage of the descriptive study will be carried out, in which the presentation and discussion of the results will occur, with comparison of the data evidenced in the analysis of the articles, in addition to demonstrating the gaps found and the future perspectives for new studies.

Finally, the 6th stage will be carried out, whose objective is the presentation of the integrative review; in this final stage, all the information of the study is presented to the reader in a clear and complete manner, who will have a critical evaluation of all the exposed ideas.

The author of the work cannot omit evidence related to the theme and must be detailed in all their findings/results.

Following the sequences of the previous stages, from the first stage to the sixth stage, the guiding question that will be used in this integrative review is “Does the use of different types of fibre post present differences regarding fracture resistance in posterior teeth?”

From this perspective, the initial hypothesis (H1) infers that different types of fibre posts have differences regarding fracture resistance in posterior teeth. The second hypothesis (H2): the glass fibre post has greater fracture resistance when compared to the quartz post in posterior teeth. The null hypothesis (H3): the quartz fibre post has greater fracture resistance when compared with the glass fibre post in posterior teeth. The null hypothesis (H0): there are no significant differences between glass fibre and quartz posts regarding fracture resistance in posterior teeth.

Regarding the research procedure, a search was carried out in electronic platforms and databases; through descriptors taken from the Mesh (Medical Subject Headings), the keywords used were chosen, namely fiber quartz (quartz fibre), fiber glass (glass fibre) and dentistry, which were interlinked with the aid of the Boolean operator “and” and searched on the Scielo platform and the PubMed, Science Direct and Scopus databases.

For the delimitation of the research, exclusion and inclusion criteria for articles were chosen for a better selection of the studies that will compose this review. Regarding the exclusion criteria: articles that did not analyse fracture resistance in posterior teeth were excluded; articles that did not make the comparison between glass fibre and quartz fibre posts, duplicate articles and those not directly linked to dentistry; master's and doctoral theses and opinion articles were also disregarded.

For the delimitation of the research, exclusion and inclusion criteria for articles were chosen for a better selection of the studies that will compose this review. Regarding the exclusion criteria: articles that did not analyse fracture resistance in posterior teeth were excluded; articles that did not make the comparison between glass fibre and quartz fibre posts, duplicate articles and those not directly linked to dentistry; master's and doctoral theses and opinion articles were also disregarded.

As for the inclusion criterion, articles that dealt, simultaneously, with glass fibre and quartz fibre posts, and with fracture resistance in posterior teeth were included; articles in which the abstract and the title were related to the theme discussed; articles that made the comparison between the different fibre posts; articles that were contained within the desired period, only the articles of the last 10 years being considered, from 2016-2026; and articles in the Portuguese and English languages.

To carry out the selection of articles, initially a reading of the title and abstract of each article was performed; soon after, the full reading of each work was carried out to define whether the articles really fit the main aspects of this research, highlighting the use of different fibre posts, both the glass fibre and the quartz fibre in posterior teeth, and that contain information on fracture resistance.

Thus, 1,353 records were found; after the filters, 63 publications were analysed, and only 5 articles were selected for meeting the requirements of the research in question. The entire course of the research and selection of the articles can be visualised in figure 1 below.

Onlay cavities extended to the buccal and palatal cusps and reaching the endodontic accesses were prepared. Ceramic onlay restorations with or without fibre posts were categorised as Group CO (ceramic onlays without posts), Group COQF (ceramic onlays and quartz fibre posts) and Group COGF (ceramic onlays and glass fibre posts). The positive control group was left unrestored (Group NR). Ten intact teeth were stored as the negative control group (Group IT). Fracture resistance was measured using a universal load-testing machine applying compressive load at a crosshead speed of 1 mm min ⁻¹ until fracture. Fracture resistance and modes were assessed statistically.	control group (IT) presented significantly higher fracture resistance than all the others ($P < 0.05$). The fracture types presented significant differences between the groups ($P < 0.01$).	improvement in the fracture resistance of endodontically treated premolars. However, the insertion of glass or quartz fibres did not significantly increase fracture resistance.
BATRA, R. <i>et al.</i> Fracture resistance in teeth treated using known endodontic techniques in Indian patients. 2022	We compared the efficacy of the zirconia post, glass fibre post, polyethylene fibre posts and quartz post.	For this study, forty-eight recently extracted mandibular first premolars were selected and randomly grouped into 4 different groups with 12 samples in each group. After endodontic treatment, the samples in all groups were submitted to post preparation, followed by	The data show that the zirconia post had the highest fracture resistance compared to other tested groups. In an inter-group analysis, excluding the zirconia post.	They assessed the fracture resistance of the glass fibre post with carbon and quartz posts and concluded that the quartz post had higher fracture resistance compared to other groups.

		restoration with the respective posts.		
MEIMANDI-NEZHAD, M. <i>et al.</i> Comparison of different surface treatment methods on flexural strength and elasticity modules of quartz and glass fibre-based posts: a narrative review. 2023	To assess the effect of different surface treatment methods on the FS and EM of quartz and glass fibre posts in the form of a narrative review study.	To conduct this study, all studies related to the subject under discussion during the years 2022-2000 were verified by systematic search in internationally available databases, including Web of Science, Science Direct, Scopus, PubMed and Google Scholar. Finally, completely relevant studies were selected to investigate the main objective.	Based on the results of some previous studies, the surface preparation of glass and quartz fibre posts by laser and 10% hydrogen peroxide has no effect on their FS and elasticity, with fracture resistance being little evidenced.	The results of previous studies are very contradictory and, therefore, it is not possible to provide a completely superior surface treatment method to increase flexural strength. The amount of flexural strength depends mainly on the intrinsic properties of the fibre post.
AMRITHA, K. M. Comparison of the fracture resistance of endodontically treated teeth restored with different aesthetic post and core systems in all-ceramic restorations cemented with two types of cements. 2023	The objective of this study is to assess the fracture resistance of three different post systems cemented by two varieties of luting cements, followed by core and full-coverage ceramic restoration. In this study, endodontic posts manufactured from zirconia, glass fibre and quartz are used.	For this study, thirty single-rooted endodontically treated mandibular premolars were selected, in which the post spaces were prepared and divided into three different groups. Group 1 (n = 10): zirconia post group. Group 2 (n = 10): quartz fibre post group. Group 3 (n = 10): glass fibre post group. Each group is subdivided into two based on the cementation system: resin-modified glass ionomer cement (RMGIC) or dual-cure resin cement (DCRC). The fracture resistance test was performed in a universal testing machine with a crosshead speed of 0.5 mm/min.	Within the zirconia post group, the mean fracture resistance was higher in the DCRC subgroup compared to the RMGIC subgroup and the difference was statistically significant ($p = 0.017$). The difference in fracture resistance between three different post systems was not considered statistically significant in relation to both cementation systems.	It was observed that when the zirconia post is used, the mean fracture resistance was higher in the dual-cure resin group compared to the resin-modified GIC group.
WANG, J. <i>et al.</i> Surface modifications of short quartz fibres and their influence on the	The objective of this study is to modify the surface properties of the fibre to improve the interfacial	In this study, we systematically introduced four different surface modification strategies on short	Of all the fillers, the SQFs-POSS demonstrated the best reinforcement effect, providing significantly greater	This work provided valuable insights into the optimisation of the filler-matrix interaction through modifications on the

3 RESULTS AND DISCUSSIONS

Dental fibre posts are indispensable materials when it comes to the rehabilitative aspect; they provide both aesthetic value and resistance for endodontically treated posterior teeth. During the period of refinement of dentistry, fibre posts became predominantly more used than metallic posts, with their hybrid properties being greatly emphasised, relating mechanical and aesthetic-functional aspects (Batra *et al.*, 2022).

Currently, there is the availability of posts with different materials that have improved characteristics, with the glass fibre post standing out, which has high mechanical resistance, an elasticity modulus close to that of dentine, better adhesiveness and homogeneity with the resin; and the quartz fibre post also stands out, which has high mechanical resistance, in addition to an elasticity modulus similar to that of dentine, as well as better light transmission. It is worth emphasising that the surface treatment and the adequate preparation of the post are stages that interfere with the deflection capacity of these posts (Meimandinezhad *et al.*, 2023).

Fibre posts are better than metallic posts because they have peculiar characteristics; however, failures related to fracture can occur regardless of the type of post, with success in rehabilitative treatment being an association between several factors. The aspects of

occlusion, dental preparation, restoration and silanisation gain prominence (Keçec; Heidemann; Kurnaz, 2016; Meimandinezhad *et al.*, 2023).

Quartz fibre posts present themselves as slightly superior to the glass fibre post, observed through the elasticity coefficient being slightly closer to that of dentine. Furthermore, other factors such as: better adhesiveness after surface treatment and satisfactory chemical compatibility benefit the use of quartz fibre posts. However, these peculiarities of quartz fibre posts differ minimally from glass fibre posts (Amritha *et al.*, 2023; Meimandinezhad *et al.* 2023; Wag *et al.*, 2024). It is important to highlight that glass fibre posts, when used in the rehabilitative process, ensure results similar to those of quartz fibre posts, with their use being an efficient alternative with an economic advantage owing to the cost-benefit (Meimandinezhad *et al.*, 2023).

The mechanical characteristics of glass fibre and quartz fibre posts are undeniable; both dental materials have similar fracture resistances, but, in a secondary manner, the preparation of the clinical crown for the positioning of the post is an action that cannot be neglected. Posts that obtained partial coverage with ceramic onlays achieved a significant improvement in fracture resistance, showing that the preparation of the tooth and the material that will be used provided optimisation in the results (Keçec; Heidemann; Kurnaz, 2016).

It is recommended that the choice of conventional resin cement ensures multiple benefits regarding stress distribution, since correct cementation needs to create a better bond to the cervical, middle and apical thirds of the radicular dentine, allowing greater final resistance. The statistical analysis performed by the unpaired t-test and one-way ANOVA, All data were analysed with a significance level of $P < 0.05$, ensured that quartz fibre posts cemented with conventional resin cement provided a slight increase in fracture resistance (Amritha *et al.*, 2023). However, the cementation must be free of defects, with it being necessary to remove bubbles and correctly fill the post (Amritha *et al.*, 2023). Another important point is the aspect of the adhesiveness of the cement, which is only effective when there is a correct balance in the final restorative assembly, that is, effective adhesion must occur between post, core and reinforcement structure. Thus, efficient adhesion between post and cement increases longevity, reducing the risk of dental fracture (Batra *et al.*, 2022; Amritha *et al.*, 2023).

From this perspective, the analysis of the fibres that compose the post is important, by the fact that the alteration in their length can cause modifications in the biomechanical and biocompatibility properties. Short fibres (small length) of quartz can improve the aforementioned properties when the work is associated with composite resin. The amount of fibre that composes the post is also relevant; the greater the volume of fibre within the post,

the higher the resistance tends to be, increasing proportionally. However, a factor that must be taken into consideration is the excess of rigidity, with a balance between the amount of fibre and the degree of rigidity being necessary so that the reverse effect does not occur and the post does not fracture easily (Meimandinezhad *et al.*, 2023; Wag *et al.*; 2024).

The advantages of quartz fibre posts that differentiate them regarding translucency are not merely aesthetic, but are also related to the polymerisation potential, since the translucency will provide greater depth of polymerisation of the cement, which will reduce possible failures and bubbles, these caused mainly by the inadequate mixing of the cement and the combined application of cement and incorrect insertion of the post. In view of this, it will lead to a better cohesion of the restorations, distributing the loads in a balanced manner and reducing probable fractures (Amritha *et al.*, 2023). As for aesthetics, they are similar between quartz fibre posts and glass fibre posts, with this advantage being allowed because of the translucency of the posts, which facilitates the passage of light, obtaining better compatibility with the conventional resin cements used. Thus, for patients who have wide smiles, showing even the posterior teeth, the use of fibre posts is indispensable (Batra *et al.*, 2022; Amritha *et al.*, 2023).

Added to this, it is important to highlight that after a tooth suffers a fracture, the rehabilitative process must be adequately planned. Endodontically treated teeth without the subsequent use of a post have fractures that are normally irreparable. Teeth that suffered fractures, but had the presence of a post within the root, both the quartz fibre post and the glass fibre post, promoted more favourable coronal fractures, with a tendency to fracture above the gingival line, which ensures a better prognosis. The present work showed no difference between glass fibre and quartz fibre posts regarding the degree of fracture analysed (Keçec; Heidemann; Kurnaz, 2016).

Glass fibre posts are widely used in the rehabilitative process, being more famous than quartz fibre posts. In general terms, the main factors that foster the use of glass fibre posts are the acceptable clinical performance already proven, the better cost-benefit, in addition to the diversities of size in the market (Batra *et al.*, 2022).

In general lines, glass fibre posts can be better than quartz fibre posts when a careful surface treatment with sandblasting and silanisation is involved. Thus, this action can increase the retention properties of the posts and promote durability (Meimandinezhad *et al.*, 2023).

4 CONCLUSION

In view of the foregoing, both the glass fibre post and the quartz fibre post present excellent biomechanical properties and biocompatibility. However, a slight advantage of the quartz fibre post over the glass fibre post is notable, a fact proven by the elasticity modulus being slightly closer to that of dentine and by responding positively to surface treatments. However, in view of a general analysis, both fibre posts obtained success in the rehabilitative treatment of posterior teeth, with both the glass fibre post and the quartz fibre post being usable. It is worth emphasising that there are no significant differences between glass fibre and quartz posts regarding fracture resistance in endodontically treated posterior teeth. And also that the surface treatment and the use of conventional resin cement, in relation to self-adhesive resin cement, are factors that need to be taken into consideration to obtain success during oral rehabilitation.

ABSTRACT

This article provides a comprehensive analysis of the historical, sociocultural, economic, and political impact of the Protestant Reformation in the Netherlands, emphasizing the role of Calvinism as a transformative force. The research traces the journey from the origins of the Reformed movement in the sixteenth century — through its precursors in the *Devotio Moderna* and the influences of Jan Łaski, Guido de Brès, and William of Orange — to the theological consolidation at the Synod of Dort (1618–1619) and the social, educational, and economic developments that defined the Dutch Golden Age of the seventeenth century. The study examines how the principle of *Sola Scriptura* drove a revolution in literacy, how the *Statenvertaling* (1637) standardised the language and access to knowledge, and how the Protestant work ethic shaped the capitalist spirit that enabled the rise of the Dutch East India Company (VOC) and the Amsterdam Exchange Bank. The analysis extends to the republican political structuring of the United Provinces, Abraham Kuyper's doctrine of Sphere Sovereignty, and the profound secularisation characterising the contemporary Netherlands. It concludes that the Reformation was not merely a religious event, but a first-order civilisational engine.

Keywords: Protestant Reformation. Calvinism. Netherlands. Golden Age. Literacy. Protestant Ethic. Synod of Dort. Dutch Society. Secularisation.

RESUMO

Este artigo analisa de forma abrangente o impacto histórico, sociocultural, econômico e político da Reforma Protestante nos Países Baixos, com ênfase no papel do calvinismo como força transformadora. A pesquisa traça o percurso desde as origens do movimento reformado no século XVI — com seus precursores na *Devotio Moderna* e as influências de Jan Łaski, Guido de Brès e Guilherme de Orange — até a consolidação teológica pelo Sínodo de Dort (1618–1619) e os desdobramentos sociais, educacionais e econômicos que definiram a Era de Ouro Holandesa no século XVII. O estudo examina como o princípio da *Sola Scriptura* impulsionou uma revolução na alfabetização, como a *Statenvertaling* (1637) padronizou a língua e o acesso ao conhecimento, e como a ética protestante do trabalho moldou o espírito capitalista que possibilitou a ascensão da Companhia das Índias Orientais (VOC) e do Banco de Amsterdã. A análise se estende à estruturação política republicana das Províncias Unidas,

1 INTRODUCTION

The history of the Netherlands in the period between the sixteenth and seventeenth centuries represents one of the most fascinating and widely studied cases of civilisational transformation driven by religious ideas. Within a span of approximately one century, a peripheral region of the Habsburg Empire — composed of seventeen politically fragmented, economically diverse, and religiously heterogeneous provinces — emerged as the most prosperous, intellectually advanced, and politically innovative nation in Europe. This phenomenon, known as the Dutch Golden Age (*Gouden Eeuw*), was not the result of geopolitical accidents or simple geographical advantages. Its genesis is deeply rooted in a religious transformation of revolutionary proportions: the adoption of Calvinism as the cultural, ethical, and political matrix of the Dutch nation.

The Protestant Reformation, formally initiated by Martin Luther in 1517 with the publication of his Ninety-Five Theses, unleashed a process of reconfiguration of European societies that greatly transcended the ecclesiastical sphere. In the Netherlands, this process took on peculiar characteristics, shaped by the local context of resistance to Spanish absolutism, by the humanist tradition of the Netherlands, and by the presence of heterodox religious movements that had already prepared the ground for a critical reception of papal authority. The result was a unique synthesis of Reformed faith, civic engagement, and entrepreneurial spirit that bequeathed to the world some of its most enduring institutions: the stock exchange, the central bank, modern capitalism, and the principles of religious tolerance and representative government.

The relevance of this study extends beyond purely historical interest. Understanding how a theological transformation was able to eradicate mass illiteracy, structure a republican and democratic political system, and create the conditions for the economic and cultural flourishing of an entire nation offers invaluable lessons for contemporary debates on the role of religion in the public sphere, on the cultural foundations of economic development, and on the institutional conditions necessary for the creation of open and prosperous societies. Max Weber, in his seminal analysis, identified in the Protestant ethic one of the engines of modern capitalism. However, as we shall argue in this article, the Dutch legacy of the Reformation goes far beyond the economic sphere, encompassing educational, political, social, and cultural dimensions of equal or greater importance.

The present article is structured into ten main sections. Following this introduction, the arrival of the Reformation in the Netherlands in the sixteenth century is examined, identifying the principal historical agents and currents of thought that prepared the ground for the religious revolution. The third section analyses the process of consolidation of the movement,

with emphasis on the Eighty Years' War and the Synod of Dort. The fourth section is devoted to the impact on literacy and education. The fifth examines economic development, with particular attention to the Golden Age and the Weberian thesis. The sixth section deals with the political and social structuring of the Republic of the United Provinces. The seventh analyses the trajectory of Dutch Protestantism up to the present day, including the phenomenon of secularisation. Sections eight, nine, and ten present, respectively, the literature review, the benefits of the research, and the conclusion, followed by the references in the Vancouver format.

In methodological terms, this article situates itself within the tradition of the history of ideas and the historical sociology of religion, articulating primary sources (confessions of faith, synodal records, state documents) with the secondary academic literature of recent decades. The analysis seeks to overcome both the reductionism that minimises the role of religion in social development and the apologetic interpretations that attribute to the Reformation a mechanical and linear causality. The aim is a nuanced, critical, and comprehensive reading of one of the most significant chapters of modern history.

2 THE INTRODUCTION OF THE PROTESTANT REFORMATION IN THE NETHERLANDS (SIXTEENTH CENTURY)

2.1 PRECURSORS AND HISTORICAL GROUND

To understand the extraordinary receptivity of the Netherlands to Reformed ideas, it is essential to look back beyond the sixteenth century and identify the movements of spiritual renewal that had previously cultivated a mentality inclined to question established ecclesiastical authority. The most influential of these precursors was the *Devotio Moderna*, a movement of practical spirituality that emerged in the fourteenth century in the region of Guelders (present-day eastern Netherlands), founded by Geert Groote (1340–1384). This movement, which organised itself institutionally through the Brethren of the Common Life and the monasteries of the Congregation of Windesheim, promoted a personal and interior piety, centred on the imitation of Christ (*Imitatio Christi*) and the meditative study of the Scriptures.

The importance of the *Devotio Moderna* for the later Reformation lies in several respects. Firstly, it cultivated a habit of independent devotional reading which, once the Scriptures became more accessible following the invention of printing by Gutenberg (c. 1440), would evolve naturally into a personal reading of the Bible. Secondly, it developed an implicit critique of the formalism and corruption of the regular clergy, without, however, reaching an open rupture with Rome. Thomas à Kempis (1380–1471), whose *De Imitatione Christi* would become one of the most widely read books of Christendom, was formed in this tradition.

Thirdly, the Brethren of the Common Life administered high-quality schools, forming a generation of literate individuals that included figures such as the humanist Erasmus of Rotterdam, whose work of translation and textual criticism of the Bible directly prepared the intellectual ground for the Reformation.

Erasmus (1466–1536), although he never abandoned Catholicism and opposed Luther's positions on free will, exerted a paradoxical and decisive influence in preparing the Netherlands for the Reformation. His critical edition of the New Testament in Greek (1516), with a new Latin translation, demonstrated that the Church's official Vulgate contained significant translation errors, undermining the textual authority on which Rome based its doctrines. His satirical critique of clerical hypocrisy in works such as *The Praise of Folly* (1509) created a climate of scepticism towards ecclesiastical institutions that would be exploited by the reformers. It was no accident that the contemporary saying held that "Erasmus laid the egg that Luther hatched".

The political context also favoured the dissemination of Reformed ideas. The Netherlands was under the dominion of the Spanish Habsburgs, but maintained a tradition of local autonomy and urban governance that resisted the centralisation imposed by Charles V and, later, by Philip II. The mercantile cities of the northern provinces — Utrecht, Amsterdam, Leiden, Haarlem — possessed a literate and cosmopolitan bourgeoisie that received Reformed ideas from Germany, France, and Switzerland through established commercial routes. This urban bourgeoisie would find in Calvinism not only a theology, but an ideological justification for its aspirations towards political autonomy and economic freedom.

2.2 PRINCIPAL REFORMERS AND PROPAGATORS OF THE MOVEMENT

The introduction of Reformed ideas into the Netherlands was not the work of a single individual or event, but of a constellation of figures and movements which, in different waves and theological strands, gradually transformed the religious landscape of the region. Identifying these historical agents is fundamental to understanding the complexity and richness of the Dutch reforming process.

The **first wave** arrived with Lutheranism, in the years immediately following 1517. Luther's theses were rapidly printed and distributed in the cities of the Netherlands through the flourishing local printing industry. The linguistic and commercial proximity to Germany facilitated the circulation of these texts. However, Lutheran penetration encountered structural limitations: Lutheran ecclesiology, with its emphasis on the authority of princes over the territorial church (*cuius regio, eius religio*), was ill-suited to a region without a Protestant

sovereign, where political power remained in the hands of Charles V, an uncompromising defender of Catholic unity.

Hinne Rode deserves special mention as one of the first channels for Reformed theology of Zwinglian orientation. Rector of the school of the Brethren of the Common Life in Utrecht, Rode travelled to Zurich in 1523, where he maintained direct contact with Ulrich Zwingli. This meeting was especially significant with regard to the doctrine of the Lord's Supper: Rode presented to Zwingli the symbolic interpretation of the Eucharist (the “hoc est” meaning “hoc significat”), which would become a central point of distinction between the Zwinglian/Reformed and the Lutheran Reformation. Rode brought back to the Netherlands a sacramental understanding that would profoundly shape Dutch Reformed spirituality.

The **second wave**, and the more disturbing one, was **Anabaptism**. **Melchior Hoffman** (c. 1495–1543), a German furrier who embraced Anabaptism after passing through Lutheranism and Zwinglianism, became a charismatic and influential preacher in the Netherlands from 1530. With his apocalyptic message — prophesying that Strasbourg would be the “new Jerusalem” and that the second coming of Christ was imminent — Hoffman attracted thousands of followers in the northern provinces, especially among the urban lower classes displaced by economic transformation. Hoffmanite Anabaptism, with its rejection of infant baptism and of the hierarchical structures of society, represented a threat not only to the Catholic Church, but to the very established social order.

The violence of the Münster episode of 1534–35, when radical Anabaptists established a “theocratic kingdom” that was brutally suppressed, tarnished the Anabaptist cause and unleashed relentless persecution in the Netherlands. It was in this context that **Menno Simons** (1496–1561) emerged, a former Frisian priest who, in 1537, published his seminal treatise condemning the use of violence and reorganised the surviving Anabaptists around principles of non-violence, separation of church and state, and rigorous community discipline. His followers, the Mennonites, survived as a pacifist and economically prosperous minority, contributing enduringly to Dutch commercial and financial culture.

The **third and decisive wave** was **Calvinism**. The theology of John Calvin (1509–1564), systematised in his *Institutiones Christianae Religionis* (whose first edition dates from 1536), offered an intellectually rigorous and practically oriented synthesis that overcame the limitations both of Lutheranism and of Anabaptist radicalism. Calvinism reached the Netherlands mainly through two channels: the infiltration of texts and ideas coming from Geneva and Huguenot France, and the organisation of communities of Protestant refugees in German and English centres.

Jan Łaski (John a Lasco, 1499–1560), a Polish nobleman of Erasmian formation who had abandoned Catholicism for Reformed Protestantism, played a fundamental institutional role. As superintendent of the Strangers' Church in London (1550–1553), he developed a model of Presbyterian ecclesiastical organisation that would directly influence the Dutch Reformed churches. Forced to leave England after the accession of the Catholic Mary I, Łaski wandered through Europe, eventually returning to Poland, but leaving an organisational legacy that his disciples carried to the Netherlands. His emphasis on the Presbyterian structure — government by elected elders, synods for the resolution of theological disputes — became the model for the Dutch Reformed Church.

Guido de Brès (1522–1567) represents another crucial figure in the transmission and systematisation of Dutch Calvinism. Born in Mons (present-day Belgium), De Brès studied in Frankfurt and was a direct disciple of Calvin in Geneva. In 1561, while working clandestinely as a Reformed preacher in the southern Netherlands, he drafted the *Belgic Confession* (*Confessio Belgica*), a document of 37 articles that systematised Reformed doctrine for the context of the Netherlands. The Confession was deliberately composed as an apology addressed to King Philip II, seeking to demonstrate that the Protestants were not subversives or Anabaptists, but Christians who followed the Scriptures. De Brès was captured and executed in 1567, becoming a martyr of the Reformed cause, but his Confession survived as one of the foundational documents of Dutch religious identity.

2.3 THE FIRST PROTESTANT COMMUNITIES

The formation of the first Protestant communities in the Netherlands took place under conditions of severe clandestinity, forced by the Habsburg policy of repression. Charles V issued a series of increasingly severe edicts against heresy, culminating in the “Edict of Blood” of 1550, which made heresy a capital crime punishable by burning (men) or by the sword or live burial (women). It is estimated that between 1523 and 1566 approximately 1,300 people were executed for heresy in the Netherlands, many of them Anabaptists, but also a growing number of Reformed Calvinists.

In response to this persecution, the first Protestants developed creative forms of community organisation. The *hagenpreken* (hedge sermons) became a distinctive feature of Dutch Protestantism in the years 1550–60: Reformed preachers held open-air services, in fields and woods on the margins of the cities, attracting crowds that could disperse rapidly upon the arrival of the authorities. These events created a sense of community identity and solidarity that transcended divisions of social class, uniting wealthy merchants, artisans, and rural labourers around a shared faith and a common resistance.

The first formally organised Reformed churches in the Netherlands were established in the years 1540–1550, frequently with the help of pastors trained in Geneva or in other Reformed academies. Emden, a city in the northwest of Germany near the Dutch border, became a crucial refuge for Dutch Reformed exiles and a centre of pastoral training. In 1571, the first Synod of the Dutch Reformed Churches was held precisely in Emden, adopting a Presbyterian church order that would become the definitive model of the future Dutch Reformed Church.

3 CONSOLIDATION OF THE REFORMATION IN THE NETHERLANDS

3.1 KEY FIGURES IN THE CONSOLIDATION OF THE MOVEMENT

The consolidation of the Protestant Reformation in the Netherlands was a process that involved both religious leaders and political figures of exceptional historical stature. Understanding the specific contributions of these personalities is essential to grasping how Calvinism moved from a movement of a persecuted minority to a constitutive force of Dutch national identity.

William of Orange “the Silent” (1533–1584) occupies a singular place in this narrative on account of his personal trajectory and his role as the architect of the Dutch nation. Born a Catholic and raised at the court of Charles V, William was originally a loyal servant of the Habsburgs, a pragmatic statesman whose initial motivations were predominantly political. His gradual conversion to Protestantism — passing through Lutheranism and arriving at Calvinism — reflected not only a personal spiritual transformation, but also a political recognition that Calvinism was the most cohesive and committed social force in the resistance to Spain. William understood before other political leaders that the Dutch revolution needed a unifying element that transcended regional and class interests, and that the Reformed faith, with its emphasis on resistance to tyranny and on the sovereignty of God over all kingdoms, could provide this ideological cohesion.

The importance of William for the consolidation of the Reformation lies in two fundamental aspects. First, he conferred upon the Protestant cause an aristocratic and military legitimacy that allowed it to organise effective resistance against the Spanish army. Second, and more surprisingly for a sixteenth-century leader, he consistently advocated a degree of religious tolerance that was extraordinary for the time. The Pacification of Ghent (1576), which he negotiated, attempted to unite Catholic and Protestant provinces against Spanish domination. Although this attempt at a pan-religious Dutch alliance eventually failed, it revealed an ideal of pluralism which, ironically and paradoxically, would become a defining characteristic of Dutch culture.

Marnix de Sainte-Aldegonde (1540–1598), a direct disciple of Calvin in Geneva and a close friend of William of Orange, played a crucial role as theologian, diplomat, and man of letters of the Reformed cause. It was he who composed the *Wilhelmus*, the Dutch national anthem — one of the oldest in the world still in use — whose lyrics express a Reformed theology of dependence on God and resistance to tyranny. Marnix also drafted the Act of Abjuration of 1581, the document by which the United Provinces declared their independence from Philip II, a document that would later influence the American Declaration of Independence.

Franciscus Gomarus (1563–1641) and **Jacobus Arminius** (1560–1609) represent the two poles of the great internal theological debate that marked the maturity of the Dutch Reformation. Gomarus, a professor at Leiden, defended the strictest version of Calvinism, including the doctrine of double predestination (according to which God had predestined some to salvation and others to damnation from before the creation of the world). Arminius, also a professor at Leiden, questioned this doctrine, arguing that divine predestination was based on God's foreknowledge of human faith. This debate — apparently esoteric — had profound implications for questions of political sovereignty, human nature, and the structure of society, becoming the catalyst for the great council that would definitively seal the theological identity of Reformed Holland.

3.2 THE EIGHTY YEARS' WAR AND INDEPENDENCE

The Eighty Years' War (1568–1648), also known as the Dutch Revolt, was the crucible in which Dutch national identity and its particular form of Calvinism were forged. This long and costly conflict — which involved episodes of siege and surrender of cities, naval battles, European diplomacy, and military innovations — cannot be understood simply as a war of political independence. It was equally a religious war, a social revolution, and a philosophical dispute about the nature of legitimate authority.

The immediate spark of the conflict was the *Beeldenstorm* (Iconoclastic Fury) of August 1566 — an outbreak of iconoclasm that swept through the southern and northern Netherlands within a matter of weeks, resulting in the destruction of images, altars, and decorations in hundreds of Catholic churches. The *Beeldenstorm* was partly spontaneous and partly organised by Calvinist militants who saw in religious icons a concrete expression of the idolatry that the Reformation condemned. For Philip II, the episode was a declaration of war against his sovereign authority and his mission of defending the Catholic faith. His response was to send the Duke of Alba with an army of approximately 10,000 soldiers who were veterans of the Italian wars.

Fernando Álvarez de Toledo, Duke of Alba (1507–1582), arrived in the Netherlands in August 1567 and immediately established the “Council of Troubles” — nicknamed by the Dutch the “Council of Blood” — a tribunal that operated outside local laws and legal traditions and that condemned thousands of people to death or exile. Among those executed were the Count of Egmont and the Count of Horn, Catholic noblemen who had opposed the extremist policies of Madrid but who were not Protestants. This indiscriminate brutality proved politically counterproductive: by attacking even moderate Catholics, Alba alienated a large part of the nobility and bourgeoisie that might have remained loyal to Philip II.

The war that followed was marked by phases of advance and retreat. William of Orange financed mercenary armies with his own resources and launched several failed invasions from exile. The strategic turning point occurred in 1572, when the so-called “Sea Beggars” (*Watergeuzen*) — Protestant privateers operating from English and German ports — captured the port city of Brill (Den Briel), unleashing a wave of uprisings in the northern provinces that rapidly expelled the Spanish garrisons from numerous cities. From this moment on, the northern provinces — headed by the wealthy province of Holland — became the base of operations of the resistance, with William as their *Stadtholder*.

The Union of Utrecht (1579) formalised the alliance of the northern provinces: Holland, Zeeland, Utrecht, Guelders, Friesland, Overijssel, and Groningen. This document established a treaty of mutual defence and political coordination that would serve as the constitutional basis for the new republic. The Act of Abjuration of 1581 was the final step: drawing on a natural-law and Reformed logic concerning the limits of sovereign authority, the United Provinces formally declared that Philip II had forfeited his right to govern by violating the privileges and rights of his subjects, thereby becoming a tyrant. With this revolutionary act, the Republic of the Seven United Provinces of the Netherlands was born — the first modern republic in European history.

The war continued for a further six decades after the Abjuration, but the de facto independence of the United Provinces was established. The Treaty of Münster (1648), part of the Peace of Westphalia, formally recognised the sovereignty of the Dutch Republic before Spain and the Holy Roman Empire, bringing to an end 80 years of conflict. During this long period, the Reformed faith had consolidated itself as the public religion of the republic — the Dutch Reformed Church (*Nederduitse Gereformeerde Kerk*) was the only publicly recognised church, with its pastors paid by the state and its temples being the medieval churches confiscated from the Catholics. Although the republic did not officially prohibit Catholicism or other confessions, they were obliged to practise their faith in private, while the Reformed Church enjoyed an incontestable public privilege.

3.3 THE SYNOD OF DORT AND THEOLOGICAL CONSOLIDATION

If the Eighty Years' War represented the political and national consolidation of the Dutch Reformation, the Synod of Dort (Dordrecht, 1618–1619) was its theological equivalent. This international council — attended by delegates from Reformed churches in England, Scotland, France, Switzerland, Germany, and Nassau, in addition to all the Dutch provinces — was convened to resolve the theological crisis generated by the Arminian Controversy.

The immediate context was explosive. The followers of Arminius, known as Remonstrants, had published in 1610 the *Five Articles of Remonstrance*, questioning the Calvinist doctrines of unconditional predestination, limited atonement, and the perseverance of the saints. The debate had rapidly spilled over from the ecclesiastical sphere to become a matter of political life: the Grand Pensionary Johan van Oldenbarnevelt, the most powerful civil official of the republic, supported the Remonstrants, partly for theological reasons and partly out of political calculations aimed at increasing provincial authority over the church. The *Stadtholder* Maurice of Nassau, son of William of Orange, supported the orthodox Calvinist Gomarists. The conflict culminated in the arrest and execution of Oldenbarnevelt in 1619 — one of the darkest episodes in Dutch republican history — and in the exile of the theologian and jurist Hugo Grotius, who sympathised with the Remonstrants.

Presided over by Johannes Bogerman (1576–1637), the synod met from November 1618 to May 1619, over 180 sessions. After hearing and refuting the Remonstrant positions, the synod formulated the *Canons of Dort*, a doctrinal document that reaffirmed Calvinist orthodoxy in five chapters corresponding to the five Arminian Remonstrances: the total depravity of the human being, unconditional election on the part of God, the limited atonement of Christ (whose benefits are applied only to the elect), the irresistible grace of the Holy Spirit, and the perseverance of the saints. These five points would become known in the Anglo-Saxon world under the acronym TULIP.

In addition to the dogmatic decisions, the Synod of Dort took practical decisions of immense social impact. It ordered the translation of the Bible into Dutch from the original languages (which would result in the *Statenvertaling* of 1637), established guidelines for primary education in all parishes, regulated the catechism as a pedagogical instrument, and determined that pastors should give special attention to the instruction of children. The Synod was, therefore, much more than a theological council: it was a founding moment of a civilisation, in which the religious and intellectual elite of the Dutch republic outlined the educational, cultural, and spiritual project that would guide the nation for centuries.

The Canons of Dort (1619) — Summary: The document consolidated Dutch Reformed theology around five fundamental affirmations, frequently termed in the

Anglophone world as TULIP: (T) Total Depravity — human nature is entirely corrupted by sin; (U) Unconditional Election — God freely elects without regard to human merit; (L) Limited Atonement — Christ died specifically for the elect; (I) Irresistible Grace — the Holy Spirit effectively transforms the heart of the elect; (P) Perseverance of the Saints — the elect never definitively lose salvation. This theological system would shape the ethics, education, and public life of the Netherlands for more than two centuries.

4 IMPACT ON LITERACY AND EDUCATION

4.1 DEVELOPMENT OF POPULAR EDUCATION AND SCHOOLS

The impact of the Calvinist Reformation on Dutch education constitutes perhaps the most dramatic and empirically documented example of how a theological transformation can produce far-reaching social consequences. To understand this phenomenon, it is necessary to start from the theological principle that motivated it: *Sola Scriptura* — the doctrine that the Bible is the sole and supreme authority for the Christian faith and life. If the Scriptures are the direct word of God to the believer, then every believer has not only the right but the sacred duty to read them personally and as a family. This apparently simple theological conclusion had revolutionary consequences: it transformed literacy from a technical skill reserved for clergy, scribes, and merchants into a spiritual necessity of the first order for every member of the Christian community.

The complementary doctrine of the *priesthood of all believers* reinforced this logic. By affirming that there is no intermediary priestly caste between the believer and God, that every Christian is a priest before the Lord, Calvinism eliminated the figure of the priest as an irreplaceable and necessary mediator of access to the sacred. In practice, this meant that each head of household was responsible for the religious instruction of his children and dependants, which made the ability to read a domestic responsibility of a religious character.

The Synod of Dort (1618–1619) transformed these theological convictions into concrete ecclesiastical policy. Article 2 of the School Regulation adopted by the synod determined that in every city and every village a school should be established, funded by the State or the Church, where children were to be instructed to read, write, understand the catechism, and practise the fundamentals of the Reformed Christian religion. This was not an abstract educational programme, but an institutional mandate with mechanisms of implementation: the consistories (governing councils of the local churches) were responsible for supervising the schools, the pastors were to inspect the pupils' progress regularly, and the civil magistrates were compelled to fund the schools and to ensure that all children — including the poor — had access to instruction.

In practical terms, the resulting educational system was structured on multiple levels. The *Kleine Scholen* (Small or Elementary Schools) were established in the local parishes to provide basic instruction in reading, writing, arithmetic, and catechism. Above these were the *Latijnse Scholen* (Latin Schools), which prepared students for university with instruction in Latin, Greek, rhetoric, and philosophy. At the top of this hierarchy were the universities, of which that of Leiden was the most prominent. This integrated system, funded by a combination of ecclesiastical, municipal, and provincial resources, constituted the first outline of a system of public education in the history of modern Europe.

The role of teachers was also radically transformed. In the medieval tradition, teaching was primarily the responsibility of the clergy. In the Dutch republic, the schoolmasters (*schoolmeesters*) became a distinct professional category, frequently examined and approved by the ecclesiastical consistories to verify their doctrinal orthodoxy, but exercising an increasingly civil function. Many schoolmasters in the small communities also accumulated the functions of municipal secretary, examiner, and pre-deacon of the local church, becoming central figures in community life.

4.2 THE STATENVERTALING AND THE LINGUISTIC IMPACT

The publication of the *Statenvertaling* in 1637 represents one of the most significant moments not only in religious history, but in the cultural and linguistic history of the Netherlands. This translation of the Bible, commissioned by the Synod of Dort in 1618 and financed by the States General (the federal parliament of the republic), was the result of nearly two decades of meticulous work by a team of highly qualified scholars.

The translators were carefully chosen from among the greatest specialists in Hebrew and Greek in the republic: Johannes Bogerman and Gijsbert Voetius for the Old Testament, Festus Hommius and Jacobus Revius for the New Testament, among others. The methodology adopted was explicitly scientific by the standards of the time: the translation was to be made directly from the original texts in Hebrew and Greek, without the mediation of the Latin Vulgate, and was to reproduce the syntactic structure and idiomatic nuances of the originals as far as possible in Dutch, preserving the literary texture of the Scriptures.

The linguistic impact of the *Statenvertaling* was analogous to that which Luther's Bible exerted on German or the King James Bible on English: it became the literary and linguistic standard that shaped modern Dutch. In a country with significant dialectal variations between the provinces — the differences between the Dutch of Utrecht, that of Groningen, and that of Zeeland were considerable — the *Statenvertaling* provided a unified literary Dutch that transcended the regional dialects. Being read and heard in all the churches of the country, in

all families and in all schools, it established a linguistic standard that strengthened the common cultural identity of the united provinces far more than any political decree could have done.

From an educational point of view, the *Statenvertaling* functioned as the nation's principal textbook. At a time when printed materials were expensive and books relatively scarce, the presence of the Bible in almost every Dutch home — guaranteed by the subsidies of the state and the Church — ensured that every family that invested in the literacy of its children would have an immediate, rich, and highly literary reference text. Children learned to read by identifying words they already knew by heart from the oral instruction of the catechism and the Sunday services. The Bible was not merely a sacred book; it was the first book that most seventeenth-century Dutch people learned to read.

4.3 CREATION OF UNIVERSITIES AND CENTRES OF LEARNING

If the parochial primary schools represented the base of the educational pyramid built by the Reformation, the universities were its apex and its most eloquent expression of the Reformed vision of a community of faith fully committed to knowledge. The foundation of the **University of Leiden** in 1575 is a symbolic event of the first order. William of Orange granted it to the city as a reward for its heroic resistance during the Spanish siege of 1574–1575 — the inhabitants of Leiden withstood the siege for more than a year, suffering severe famine, before being relieved by the “Sea Beggars” who flooded the polders. The university was, therefore, both a prize for bravery and a deliberate investment in the intellectual future of the republic.

Leiden rapidly became one of the most important intellectual centres in Europe. Its location in the Netherlands — where the relative freedom of the press and intellectual tolerance were superior to those of any other European country — attracted scholars who elsewhere would have faced persecution. René Descartes lived in the Netherlands for 20 years (1628–1649), taking advantage of this atmosphere of freedom.

Baruch Spinoza, a Dutch Jewish philosopher, produced in Amsterdam works that would have been impossible anywhere else in Catholic Europe. Hugo Grotius, the founder of modern international law, developed at Leiden his ideas on natural law and the laws of war. This concentration of intellectual talent was not accidental: it was the direct result of a religious and state policy that valued knowledge as an essential dimension of the pious and republican life.

In addition to Leiden, other universities were founded during the Golden Age: the University of Franeker in Friesland (1585), the University of Groningen (1614), the University

of Utrecht (1636), and the University of Harderwijk (1648). This extraordinary number of universities — five institutions for a population of approximately 2 million people at the beginning of the seventeenth century — reflects both the commitment to higher education and the federal structure of the republic, where each major province wished to have its own institution for the training of pastors and magistrates.

4.4 COMPARATIVE LITERACY RATES

The results of the educational policies driven by the Reformation are empirically measurable and reveal an extraordinary divergence between Holland and the rest of Europe. Historical studies on literacy in the early modern period fundamentally use two types of evidence: the ability to sign one's own name on official documents (such as marriage registers, inventories, and contracts) and the number of works published and sold. Although the signature is only an approximate indicator of full literacy, it provides quantifiable data that allow robust historical comparisons.

Table 1*Estimated Literacy Rates in Western Europe (Seventeenth–Eighteenth Centuries)*

Country / Region	c. 1650 — Men (%)	c. 1650 — Women (%)	c. 1750 — Men (%)	c. 1750 — Women (%)
Dutch Republic (Holland)	75	50	85	64
England (London)	65	35	70	45
Scotland (cities)	60	30	65	40
France (North)	35	15	50	27
Spain (Castile)	20	8	30	12
Italy (Central)	22	10	32	14

Source: prepared by the authors.

Note: Estimated data based on Eskelson (2021), Stone (1969), and Graff (1987). The rates vary significantly between urban and rural areas within each country.

As the table above shows, the Dutch Republic had rates of male literacy that were double those of France and almost four times those of Spain in the mid-seventeenth century. Even more remarkable is the rate of female literacy: with 50% of adult women able to sign their name in the mid-seventeenth century, Holland was generations ahead of any other European country in this respect. This datum is especially significant because it reveals that the Dutch educational revolution was not limited to the male sex — although gender inequality persisted, it was dramatically smaller than in the neighbouring countries.

Eskelson (2021), in his study on institutions and literacy in early modern Western Europe, argues that the difference between Protestant and Catholic countries cannot be explained by the religious factor alone; variables such as urbanisation, per capita wealth, and the existence of commercial networks also play a significant role. However, he concludes that, controlling for these variables, the specific influence of Protestant institutions — especially Holland and Scotland — on literacy rates remains statistically significant, suggesting a genuine causal effect of Reformed Protestantism on popular education.

Another revealing indicator is the number of books published. In 1630, the Dutch Republic was responsible for approximately half of the entire typographical output of Europe.

Amsterdam had become the largest publishing centre in the world, publishing not only religious texts but also scientific, philosophical, literary, and political works that were censored in other European countries. This publishing flourishing was both a cause and a consequence of the high literacy rate: a literate population created demand for books, and the availability of books encouraged literacy.

5 ECONOMIC DEVELOPMENT

5.1 THE PROTESTANT ETHIC AND THE DUTCH CAPITALIST SPIRIT

The connection between Reformed Protestantism and economic development was analysed most influentially by the German sociologist Max Weber in his work *The Protestant Ethic and the Spirit of Capitalism* (1904–1905). The Weberian thesis, although widely debated, contested, and nuanced by subsequent research, remains an unavoidable point of departure for understanding the Dutch phenomenon. For Weber, Calvinism developed a set of attitudes and practices in relation to work, money, and material life that were especially conducive to the development of a rational and methodical capitalist economy.

The first element of this ethic was the doctrine of *vocation* (*Beruf* in German, *roeping* in Dutch). Whereas in the medieval Catholic tradition God's "calling" was primarily understood as a call to the contemplative religious life (monasticism), Calvinism radically democratised the concept: any legitimate activity — whether craftsmanship, commerce, agriculture, medicine, or the magistracy — was a divine calling that the believer was to exercise with the utmost diligence and excellence. This theological dignification of secular work had powerful behavioural consequences: to work with discipline, efficiency, and integrity was not merely an economic virtue, but an act of worship of God.

The second element was *inner-worldly asceticism*, the paradoxical combination of an intense activity in the world (and therefore of the production of wealth) with a rigorous restriction on personal consumption. The orthodox Calvinist was not a monk who fled from the world, but neither was he an aristocrat who displayed his wealth in feasts and palaces. He worked intensely, accumulated wealth, but consumed only what was necessary for a pious and ordered life. The mathematical result of this combination was inevitable: the difference between production and consumption, between income and expenditure, was systematically reinvested in the business itself or in the community, generating an accumulation of capital on an unprecedented scale.

The third element was the soteriological anxiety produced by the doctrine of predestination. If salvation was predetermined by God before the creation of the world, and if human beings could not, by their own works, influence this divine decision, how could the

believer have any certainty that he was one of the elect? Weber argued that Calvinists sought external signs of election in their successes in work and business: material prosperity, the product of a life of discipline and diligence, became a psychological evidence of divine grace. Although this relationship between prosperity and election was never affirmed as official doctrine by the Reformed churches, it functioned as a powerful psychological engine that drove the economic behaviour of believers.

It is important to note that the relationship between Calvinism and capitalism is not without historical complexity. Historians such as Amintore Fanfani (1935) and Hugh Trevor-Roper (1967) questioned different aspects of the Weberian thesis. Fanfani argued that commercial capitalism already existed in Catholic Italy of the fifteenth century, independently of Protestantism. Trevor-Roper observed that many of the most important entrepreneurs of the Dutch Golden Age were refugees from the southern Netherlands — Flemings and Brabanters — whose economic dynamism was not exclusively determined by religion, but also by their displacement from the Catholic centres and the need to rebuild their fortunes in a new environment.

However, these objections, though pertinent, do not refute the Dutch phenomenon as a whole. As the historian Jonathan Israel argues in his monumental *The Dutch Republic: Its Rise, Greatness, and Fall 1477–1806* (1995), what distinguished the Dutch economy was not merely the individual spirit of its entrepreneurs, but the institutional ensemble that Calvinism helped to create: an educational system that produced a highly literate and numerically competent workforce; an ethic of commercial trust based on the word of honour and on the community ties of church membership; a theological distrust of state absolutism that favoured the creation of a regulatory environment favourable to commerce; and a network of trans-regional and transnational solidarity among Reformed communities that facilitated credit and commercial information.

5.2 THE DUTCH GOLDEN AGE (SEVENTEENTH CENTURY)

The Dutch Golden Age (*Gouden Eeuw*), which spans approximately the seventeenth century, represents one of the most extraordinary periods of cultural, scientific, and economic flourishing in the history of humanity. A nation of approximately two million inhabitants — smaller than many contemporary European cities — controlled the largest maritime trade in the world, possessed the most sophisticated financial institutions on the planet, produced some of the greatest artists (Rembrandt, Vermeer, Hals) and scientists (Huygens, van Leeuwenhoek) of its time, and established colonies and trading posts on four continents.

The Dutch economic ascent was driven initially by what the Dutch themselves called the “mother trade” (*moedernegotie*): the grain and timber trade of the Baltic. Already in the fifteenth century, Dutch merchants dominated the routes between the producing ports of the eastern Baltic (Danzig, Riga, Königsberg) and the consumer markets of the Netherlands, France, and the Iberian Peninsula. This dominant position in the trade of essential commodities provided the initial capital and the commercial networks on which the future global expansion would be built. The *fluiten* — Dutch merchant ships of innovative design, more efficient and cheaper to operate than the English or Portuguese equivalents — gave the Dutch merchant fleet a decisive competitive advantage.

The expansion into the trade of Asian spices — pepper, nutmeg, clove, cinnamon — which the Portuguese had dominated since the beginning of the sixteenth century, represented the next step in the Dutch economic ascent. The creation of the *Vereenigde Oost-Indische Compagnie* (VOC) in 1602 was the organisational response to this challenge. With initial capital of 6.5 million guilders raised from more than 1,000 shareholders in six regional chambers, the VOC was not only the first joint-stock company in history, but also the first to possess quasi-sovereign powers: the right to wage war, to negotiate treaties, to mint coin, and to administer territories. Supported by a permanent fleet of warships and by the accumulated capital of its shareholders — many of whom were prominent members of the Reformed Church — the VOC expelled the Portuguese from their strategic positions in the Indian Ocean and established a commercial empire that extended from Batavia (present-day Jakarta) to Ceylon, from the Malabar Coast to Japan.

In parallel with global trade, the Dutch domestic economy diversified and modernised in an impressive manner. Specialised agriculture — especially tulip flowers, whose speculative fever of 1636–37 may be considered the first financial bubble in history — was highly productive. The dairy industry, the herring fishery in the North Sea (with technical innovations such as the curing of the fish on board the boats), the textile industry of Leiden and Haarlem, shipbuilding, and the production of Delft ceramics (inspired by the Chinese porcelain brought by the VOC) constituted a diversified industrial base. This integrated economy was sustained by a financial system of unparalleled sophistication: the Bank of Amsterdam (1609), the Amsterdam Loan Bank (1614), the Amsterdam Stock Exchange (1609), and a developed marine insurance market created a system of mobilisation and allocation of capital that would only be surpassed by the English Industrial Revolution of the eighteenth century.

5.3 COMMERCIAL EXPANSION, THE VOC, AND THE IMPACT ON CLASS STRUCTURE

The Dutch commercial expansion of the Golden Age had profound implications for the internal social structure of the republic. Unlike the European feudal monarchies, where wealth and power were fundamentally associated with the possession of land and aristocratic birth, the Dutch commercial economy created a ruling class of mercantile origin — the *regenten* (regents) — whose power was based on the commercial and financial capital accumulated through business.

This class of regents controlled not only the great commercial companies, but also the municipal and provincial administration. In the assemblies (Estates) of the provinces and in the municipal councils, it was the representatives of this wealthy bourgeoisie who made the political decisions. Their power was, to a certain degree, counterbalanced by the influence of the Reformed pastors and by the populism of the artisans and skilled workers organised in the craft guilds. This tension between different social groups, all articulating their demands through a representative political structure, brought the Dutch republic closer to a modern democracy than any other form of European government of the seventeenth century.

The Calvinist ethic of work and saving created, according to some historians, a culture of social mobility based on merit that was remarkably rare for the time. Although the republic was not an egalitarian society — the disparities of wealth were considerable, especially between the great merchants of the VOC and the workers of the shipyards — the dominant cultural narrative valued self-improvement through diligent work, education, and integrity, not the privilege of birth. This mentality favoured upward social mobility for those who demonstrated the Reformed virtues of discipline, frugality, and commercial honesty.

6 POLITICAL AND SOCIAL STRUCTURING

6.1 THE POLITICAL SYSTEM OF THE UNITED PROVINCES

The Republic of the Seven United Provinces constituted an unprecedented political experiment in seventeenth-century Europe. On a continent dominated by absolutist monarchies that asserted the divine right of kings, the Netherlands developed a republican, federalist, and representative system that challenged the dominant political logic of the time. Understanding how Calvinist theology contributed to the formation and legitimation of this political system is essential to evaluating the historical legacy of the Dutch Reformation.

The theological basis of Dutch republicanism lay, in part, in the Calvinist doctrine of *total depravity*. This doctrine, which holds that all dimensions of human nature — including reason and will — are corrupted by sin since the Fall of Adam, had profound political implications: if no human being is intrinsically good enough to exercise unlimited power over

his fellow human beings without succumbing to corruption and tyranny, then no political system should concentrate excessive power in a single person or institution. This theological distrust of absolute human power translated into a practical preference for systems of checks and balances, division of power, and institutional accountability.

The political system of the United Provinces reflected this philosophy in its structure. Sovereignty resided formally in the seven provinces (Holland, Zeeland, Utrecht, Guelders, Overijssel, Friesland, and Groningen), each with its own provincial assembly (the *Staten*). These assemblies, in turn, sent delegates to the *Staten-Generaal* (States General), the federal body in The Hague that coordinated foreign policy, defence, and other matters of common interest. Crucially, decisions in the States General on fundamental questions required unanimity among the provinces, ensuring that none of them — not even the far richer and more populous Holland — could impose its will on the others.

The executive power was divided between two potentially rival centres. The *Stadtholder* — an office that in practice remained in the House of Orange-Nassau during most of republican history — was the military commander and the arbiter of provincial disputes. The Grand Pensionary (*Raadspensionaris*), the highest civil official of the province of Holland, was the principal diplomatic negotiator and the spokesman for the commercial interests of the urban bourgeoisie. The tension between these two sources of authority created a fluid political dynamic which, although it sometimes generated crises (such as the one that culminated in the execution of Oldenbarnevelt in 1619 and the “murder” of Oldenbarnevelt's brother), prevented the crystallisation of power in a single centre.

This political system was intellectually justified through a legal and philosophical theory that combined classical natural law with Reformed principles. **Hugo Grotius** (1583–1645), the greatest jurist of the period, developed in works such as *De Jure Belli ac Pacis* (1625) a theory of international law and just war that was explicitly founded on principles of natural law, but which resonated with the Reformed ethic of responsibility and limitation of state power. The Act of Abjuration of 1581 itself, by justifying the deposition of Philip II on the basis of his violation of the fundamental rights of his subjects, anticipated arguments that would only be fully developed by John Locke at the end of the seventeenth century.

6.2 RELIGIOUS TOLERANCE AND PLURALISM

One of the most paradoxical and fascinating aspects of the Dutch republic was its practice of relative religious tolerance, which contrasted vividly with the wars of religion that devastated the rest of Europe during the same period. Although the Reformed Church was the only publicly privileged denomination — with its pastors paid by the state and its temples

being the public churches — the other religious confessions were, for the most part, tolerated in practice, provided they contented themselves with the private practice of their worship.

The Catholics, who constituted a significant minority especially in the southern provinces and the border regions, could practise their faith in “hidden churches” (*schuilkerken*) — residential spaces converted into places of worship that were of general knowledge to the authorities, but which were tacitly tolerated in exchange for the payment of fees. The Mennonites and other Anabaptist denominations, whose pacifism and industriousness made them economically valuable citizens, were generally tolerated, especially in Amsterdam. The Lutherans maintained their own congregations in the cities. The dissident Calvinists (Remonstrants) found refuge after the Synod of Dort especially in Amsterdam and in other cities.

Even more remarkable was the tolerance extended to the Jews. Amsterdam became at the beginning of the seventeenth century one of the principal centres of the European Jewish diaspora, receiving both Sephardic Jews expelled from the Iberian Peninsula (where they had suffered the persecutions of the Inquisition and been forced to convert to Catholicism as *conversos*) and Ashkenazi Jews from Central and Eastern Europe. The Jews could openly practise their religion, maintain synagogues and academies of religious study (*yeshivot*), and participate in the economic life of the republic to degrees of freedom without parallel in the contemporary Christian world. Baruch Spinoza (1632–1677), born in the Sephardic community of Amsterdam, although eventually excommunicated by his own community, produced his revolutionary philosophical works in an environment that, despite its tensions, was fundamentally more open than any other in Europe.

This practice of tolerance should not be romanticised or seen as a coherent application of the modern principle of religious freedom. It had fundamentally pragmatic bases: the republic needed to attract and retain human and financial capital, and religious persecution was economically destructive. The Jewish merchants, the Mennonite artisans, the Sephardic financiers, the Flemish artisans who were refugees from the wars of religion of the south — all contributed skills, capital, and commercial networks that the republic needed. In addition, many of the regents who governed the cities had a political interest in keeping the Calvinist pastors under control, preventing the Reformed Church from becoming a state within the state. Tolerance was, in part, an instrument of governance that kept clerical influence within acceptable limits.

However, regardless of its motivations, the effects of Dutch tolerance on the intellectual culture of the republic were immeasurable. The possibility of publishing works prohibited in other countries, the presence of communities of different religious and intellectual traditions,

and the lesser intervention of ecclesiastical censorship in public life created in Amsterdam and the other cities of the republic an environment of intellectual pluralism that was, for more than a century, the most fecund in Europe.

6.3 SPHERE SOVEREIGNTY: ABRAHAM KUYPER AND THE POLITICAL LEGACY OF CALVINISM

Abraham Kuyper (1837–1920) represents the most elaborate and influential synthesis of Dutch Calvinism as a political and social philosophy. Pastor, theologian, journalist, founder of a political party, founder of a university, professor, and Prime Minister of the Netherlands between 1901 and 1905, Kuyper was one of the most extraordinary figures of the nineteenth and early twentieth centuries, whose influence extended well beyond the Dutch borders.

Kuyper's most enduring contribution to political philosophy was the doctrine of *Sphere Sovereignty* (*Souvereiniteit in eigen kring*), elaborated in his celebrated inaugural lecture at the Free University of Amsterdam in 1880 and developed over the course of his career. The central thesis of this doctrine is that God created society as a plurality of spheres of authority — family, church, state, science, art, commerce, etc. — each with its own sovereignty derived directly from divine ordination, not from the delegation of the state. The role of the state, according to Kuyper, is threefold: to guarantee harmony among the spheres; to prevent any one of them from dominating or invading the others; and to protect individuals within each sphere against abuses of power.

This doctrine had radical implications for practical politics. In the first place, it provided a theological justification for institutional pluralism: in a confessional Christian society such as the Netherlands, different religious groups — Calvinists, Catholics, Lutherans — had the right to their own schools, universities, newspapers, and social organisations, each with its own confessional identity, without the state imposing a secularist uniformity or a dominant religious denomination upon all. In the second place, it structurally limited the power of the state: the government had no authority to intervene in the internal affairs of the family, the church, or other voluntary associations, except to guarantee the law and to prevent injustices.

In practical politics, Kuyper translated these ideas into the creation of the *Anti-Revolutionary Party* (1879) — the first mass political party in the Netherlands — the *Free University of Amsterdam* (1880) — a university explicitly founded on Calvinist principles, independent of the state and of the established church — and the system of confessional education subsidised by the state (*bijzondere scholen*), by which private schools of religious inspiration received public funding proportional to the number of enrolled pupils. This last

point was the core of the Dutch “school struggle” that dominated the country's politics for decades, being finally resolved by the Pacification of 1917, when the Dutch Constitution guaranteed equal funding for public and confessional schools — a system that persists to this day.

7 EVOLUTION UP TO THE PRESENT DAY

7.1 PILLARISATION (VERZUILING) AND ITS LEGACY

The social system that Kuyper helped to build — the so-called *verzuiling* (pillarisation) — became the dominant form of organisation of Dutch society in the twentieth century. The concept of pillarisation describes the division of Dutch society into parallel vertical ideological “pillars” (*zuilen*): an orthodox-Protestant (Calvinist) pillar, a Catholic pillar, a socialist pillar, and a liberal pillar, each with its own complete infrastructure of social, cultural, and political organisations. In its full development, around 1920–1960, pillarisation meant that a Dutch citizen could be born in a hospital of his pillar, be educated in schools of his pillar, work in a trade union of his pillar, read the newspaper of his pillar, listen to the radio of his pillar, and be buried by an undertaker of his pillar, without ever having significant contact with members of the other pillars.

The Protestant pillar, direct heir of the Calvinist tradition and of the work of Kuyper, exerted a formidable political and cultural influence during the first decades of the twentieth century. Kuyper's Anti-Revolutionary Party and its coalition partner, the Christian Historical Union, governed the Netherlands in coalition with the Catholic party during much of the interwar period. The Protestant confessional schools educated a significant proportion of Dutch youth. The Free University of Amsterdam, the University of Utrecht (with strong Reformed influence), and the Free University of Amsterdam trained generations of pastors, lawyers, doctors, and teachers who carried Calvinist values into all professions and instances of public life.

This system of pillarisation was, during its existence, remarkably effective in managing the religious and ideological diversity of a pluralist society. By ensuring that each major group had its own institutions subsidised by the state, it avoided the acute religious conflicts that had devastated other European countries. The “civil peace” that characterised the Netherlands during much of the twentieth century, in contrast to the religious or ideological civil wars of other countries, can be attributed in part to this system of “consociationalism” — the management of pluralism through the guarantee of institutional autonomy for each group.

7.2 SECULARISATION AND CONTEMPORARY SOCIETY

The most dramatic transformation of the Netherlands in the post-war period was the accelerated process of secularisation which, within a few decades, transformed one of the most deeply religious nations of Europe into one of the most secular in the Western world. This process, known as *ontzuiling* (de-pillarisation), refers both to the decline of individual religiosity and to the collapse of the system of pillars that had organised Dutch society during the twentieth century.

Dutch secularisation began slowly in the decades of the 1950s and 1960s, but accelerated dramatically after the cultural uprisings of 1968. The post-war generation, having grown up in unprecedented economic prosperity and educated to ever higher levels, began to question the traditional religious authorities. The concept of “emancipation” — of paradoxically Calvinist and socialist origin — which had been employed to describe the achievement of equality of rights by subaltern groups within the system of pillars, was redirected towards personal liberation from traditional moral and religious restrictions. Television, the universalisation of higher education, the expansion of the welfare state, and the international counterculture conspired to erode the communitarian loyalties that sustained the pillars.

The decline was especially pronounced among the Protestants. The Dutch Reformed Church (*Nederlandse Hervormde Kerk*), which had been the most influential institutional expression of Dutch Calvinism for centuries, saw its membership fall dramatically. In an attempt to reverse this decline through consolidation, the Dutch Reformed Church merged in 2004 with the Reformed Churches in the Netherlands (*Gereformeerde Kerken in Nederland*) and with the Evangelical Lutheran Church to form the *Protestantse Kerk in Nederland* (PKN). Despite the merger, the decline continued: in 2022, the PKN counted fewer than 1.6 million active members, compared with the nearly 4 million that the founding churches had had in previous decades.

The statistics of Statistics Netherlands (CBS) for 2022 reveal a radical transformation of the Dutch religious landscape: approximately 58% of the population over 15 years of age belonged to no religion, an expressive increase in relation to the 45% recorded in 2010. The Catholics represented about 18% of the population (a fall from 27% in 2010), while the Protestants totalled only 14% (a fall from 18% in 2010). The Muslims, whose presence is largely the result of the immigration of the 1960s–1980s, maintained a stable proportion of about 5%, with rates of religious observance significantly higher than those of the Christians. Among Dutch young people aged 18 to 25, fewer than 25% identified with any religion in 2022.

Table 2*Religious Profile of the Netherlands (2010–2022)*

Religious Affiliation	2010 (%)	2015 (%)	2022 (%)
No religion	45	52	58
Catholics	27	23	18
Protestants (PKN and others)	18	16	14
Muslims	5	5	5
Others (Hindus, Buddhists, Jews)	5	4	5

Source: Statistics Netherlands (CBS), 2022. Data referring to the population over 15 years of age.

Notwithstanding the secularisation of formal religious life, the cultural legacy of the Protestant Reformation remains deeply inscribed in the structures and values of contemporary Dutch society. The emphasis on education and literacy, which produced one of the most efficient educational systems in the world (with Dutch students consistently among the best in the international PISA rankings); the culture of tolerance and pluralism, which made the Netherlands a pioneer in the recognition of civil rights for minorities; the ethic of disciplined work and the meticulous management of resources, which manifests itself in the efficiency of Dutch agriculture and the solidity of its public finances; the commitment to international law and multilateral institutions, which has roots in the Grotian tradition of natural law; all these elements are, to a significant degree, secularised inheritances of the Calvinist culture that the Protestant Reformation implanted in the Netherlands.

8 LITERATURE REVIEW

The academic literature on the Protestant Reformation in the Netherlands and its impacts is vast and multidisciplinary, encompassing works of history, sociology, theology, economics, and political science. This section presents a critical review of the most relevant and influential works, organised by thematic axes.

8.1 THE THEOLOGICAL AND CULTURAL PERSPECTIVE

The work of **Abraham Kuyper**, especially the *Lectures on Calvinism* (conferences delivered at Princeton University in 1898 and published in 1899), remains indispensable for understanding the comprehensive cultural impact of Calvinism. Kuyper argued not merely about Reformed theology in the strict sense, but about Calvinism as a *Weltanschauung* — an integral worldview that generated specific implications for art, science, politics, and

economics. His analysis of Sphere Sovereignty continues to be a powerful theoretical framework for understanding the institutional plurality of modern democracies. The critique that may be made of Kuyper is that his vision is essentially apologetic and at times teleological, tending to present the Dutch developments as the necessary realisation of Calvinist principles, without sufficient attention to the contingent aspects and the non-religious forces that also shaped the Dutch trajectory.

Herman Bavinck (1854–1921), a contemporary and collaborator of Kuyper, offers a complementary perspective. In his monumental *Reformed Dogmatics* (4 volumes, 1895–1901), Bavinck articulates Calvinist theology systematically with a historical sensibility and an openness to dialogue with modernity that prefigure many theological developments of the twentieth century. Bavinck is particularly useful for understanding the relationship between Calvinist orthodoxy and the Erasmian humanist heritage, which Dutch Calvinism never completely abandoned.

8.2 THE SOCIOLOGICAL AND ECONOMIC PERSPECTIVE

The work of **Max Weber**, *The Protestant Ethic and the Spirit of Capitalism* (1904–1905), remains the obligatory point of reference for any discussion of the relations between Protestantism and economic development. Although many of his specific arguments have been contested by later research — especially his dating of the “capitalist spirit” and his characterisation of medieval capitalism — his central intuition concerning the relationship between religious ethics and economic behaviour continues to be fecund. The most sophisticated response to the Weberian thesis came from R. H. Tawney in *Religion and the Rise of Capitalism* (1926), which offers a more nuanced analysis of the relationship between Protestantism, Catholicism, and capitalism, avoiding the unilateral determinism of Weber.

For the Dutch case specifically, the unavoidable reference work is the monumental *The Dutch Republic: Its Rise, Greatness, and Fall 1477–1806* by **Jonathan Israel** (Oxford University Press, 1995). With more than 1,200 densely documented pages, Israel analyses the rise and decline of the Dutch republic as a multifactorial phenomenon, in which the Protestant Reformation is one among several determining elements, including the geographical structure (the Rhine delta), the naval innovations, the pre-existing urban tradition, and the geopolitical conjunctures. Israel is particularly useful for understanding the internal tensions of the republic and the factors that eventually led to its decline in the eighteenth century.

Geoffrey Parker, in *The Dutch Revolt* (1977), offers the most detailed and balanced analysis of the Eighty Years' War, situating it in the broader context of the European wars of

religion and the crisis of the Habsburg system. Parker examines both the religious and the political, social, and military dimensions of the conflict, demonstrating that the victory of the Dutch revolution was contingent and dependent on a specific combination of factors that would hardly be repeated.

8.3 THE PERSPECTIVE OF EDUCATION AND LITERACY

Tyrel C. Eskelson, in “States, Institutions, and Literacy Rates in Early-Modern Western Europe” (2021), published in the *Journal of Education and Learning*, offers the most recent and methodologically sophisticated quantitative analysis of the relationship between Protestantism and literacy. Using data from multiple countries over the period 1500–1800 and controlling for economic and urban variables, Eskelson confirms the existence of a “Protestant effect” on literacy that is statistically robust, especially in the case of the Calvinist nations. The work is required reading for any researcher who wishes to go beyond generalisations and work with rigorous empirical evidence.

The classic work of **Harvey J. Graff**, *The Legacies of Literacy: Continuities and Contradictions in Western Culture and Society* (1987), provides the broader context for understanding the reading revolution in modern Europe. Graff demonstrates that the relationship between literacy and Protestantism, although real, was mediated by a series of other factors — urbanisation, economic development, typographical tradition — that made Protestantism a facilitating condition, not a sufficient condition, for mass literacy.

8.4 THE CONTEMPORARY PERSPECTIVE

For the analysis of contemporary Dutch secularisation, the works of **Peter Berger** are essential. In *The Sacred Canopy* (1967) and in later works such as *The Desecularization of the World* (1999), Berger revised his initial thesis on secularisation as an inevitable consequence of modernity, recognising that the Netherlands is an exceptional case within a world that, globally, remains deeply religious. This revision offers a valuable comparative perspective for understanding why Dutch secularisation was more profound and rapid than in many other Protestant countries.

The works of the Dutch sociologist **Peter Achterberg** and collaborators on the “Dutch paradox” — how a country with such deep Calvinist roots secularised so completely — represent the most current empirical research on this phenomenon, using data from longitudinal surveys of Statistics Netherlands to trace the religious transformations of Dutch society over the decades.

9 BENEFITS OF THE RESEARCH

The investigation of the impact of the Protestant Reformation on Dutch development offers benefits that transcend historical interest in the strict sense, projecting themselves onto fundamental questions of contemporary debates in the sociology of religion, political science, the theory of economic development, and the philosophy of education.

For the Sociology of Religion and the Theory of Secularisation: The Dutch case is a privileged historical laboratory for testing the hypotheses on the relationships between religion and modernity. The trajectory that goes from the most fervent of the Calvinist nations of the seventeenth century to the most secularised society of contemporary Europe challenges the simplistic versions of the secularisation thesis — which predicted a linear relationship between modernisation and the decline of religiosity — while at the same time illustrating the mechanisms by which a religious tradition can gradually produce the conditions of its own supersession. The Calvinist emphasis on education and critical reading produced generations of literate citizens capable of questioning religious authority itself; the doctrine of sphere sovereignty, by limiting the power of the Church over the state and civil society, created the autonomous spaces from which secularisation could advance.

For the Theory of Economic Development: The Dutch experience demonstrates the importance of institutional and cultural variables in economic development, complementing and at times challenging the analyses that privilege geographical, technological, or resource-endowment factors. Investment in education as a factor of economic development — today an axiom of development economics — finds one of its most eloquent historical examples in the Holland of the seventeenth century, where mass literacy, motivated by religious reasons, created a workforce of high productivity and a mercantile class capable of financial and organisational innovation. The creation of the VOC as a joint-stock company, of the Bank of Amsterdam as a precursor of the central bank, and of the Amsterdam Stock Exchange as the first organised capital market are institutional innovations whose cultural roots go back, at least in part, to the Reformed tradition of community organisation, accountability, and collegial management.

For Political Science and Democratic Theory: The republican system of the United Provinces anticipated many of the characteristics that we consider essential to modern democracies: representation, federalism, checks and balances, tolerance of minorities, independence of the judicial power. The analysis of the theological bases of this system — the Calvinist distrust of unrestricted human power, the doctrine of sphere sovereignty, the tradition of collegial ecclesiastical government — contributes to the understanding of the cultural foundations of liberal democracies, a subject of growing relevance in an era of rising

authoritarianism. Kuyper's doctrine of Sphere Sovereignty, in particular, offers a conceptual framework alternative to the liberal social contract of Locke and Rousseau for grounding political pluralism and the limitation of state power, with direct implications for contemporary debates on the role of religion in democracy.

For Theology and the Church: This study demonstrates, with robust historical evidence, that doctrinal fidelity and social engagement are not mutually exclusive alternatives. Dutch Calvinism was, simultaneously, rigorously orthodox in its doctrinal standards (the Canons of Dort, the Belgic Confession, the Heidelberg Catechism) and profoundly transformative of the society in which it was inserted. This combination challenges both the pietism that divorces faith from civic engagement and the social activism that sacrifices doctrinal depth in favour of immediate relevance. The Dutch model suggests that a community of faith that takes seriously both its theology and its responsibilities towards the creation of God can be a powerful agent of civilisational transformation.

For the Educational Sciences: The Dutch educational revolution of the seventeenth century offers historical evidence for the thesis that the best educational systems are those that are rooted in a coherent and motivating vision of human dignity and destiny. The Dutch school was not merely an institution for the transfer of technical information; it was the space for the formation of a civic and spiritual identity, for the transmission of values, and for the creation of a community of persons capable of reading, thinking, and participating actively in public life. This integral vision of education — which rejects both pure instrumentalism (education as preparation for the labour market) and narrow ideologism (education as indoctrination) — has much to offer to contemporary educational debates.

10 CONCLUSION

The historical journey analysed in this article confirms and expands the central thesis that motivated the investigation: the Protestant Reformation, in its specific Calvinist form, was a first-order civilisational engine in the development of the Netherlands. Starting from the first Lutheran and Anabaptist infiltrations of the 1520s, passing through the theological and organisational systematisation brought by figures such as Guido de Brès, Jan Łaski, and John Calvin, up to the dramatic consolidation in the forge of the Eighty Years' War and the intellectual crucible of the Synod of Dort, Dutch Calvinism forged a nation whose influence on the development of Western modernity is inversely proportional to its geographical size.

The impacts identified and analysed throughout the sections of this article may be synthesised into four fundamental dimensions:

In the first place, the **educational dimension**: the principle of *Sola Scriptura* and the doctrine of the priesthood of all believers transformed literacy from an elite privilege into a universal spiritual necessity, producing the highest literacy rates in Europe in the seventeenth century and establishing the model of public education that the following centuries would only refine. The *Statenvertaling* of 1637 linguistically unified the nation and provided the textual basis for an unprecedented intellectual revolution.

In the second place, the **economic dimension**: the Protestant ethic of work as a divine vocation, of inner-worldly asceticism, and of the systematic reinvestment of the surplus created the cultural conditions for the accumulation of capital and the institutional innovation that defined the Golden Age. The VOC, the Bank of Amsterdam, the Amsterdam Stock Exchange — all these institutional innovations that shaped modern capitalism emerged from a cultural environment profoundly marked by Reformed values.

In the third place, the **political dimension**: the Calvinist distrust of absolute human power, grounded in the doctrine of total depravity, was the theological substrate of an innovative republicanism that anticipated central elements of modern liberal democracies. The Act of Abjuration of 1581, by grounding the legitimacy of government in respect for the rights of the governed, foreshadowed Locke and, through him, the declarations of independence of the eighteenth century. Kuyper's doctrine of Sphere Sovereignty articulated this Reformed intuition systematically into a political philosophy of high contemporary relevance.

In the fourth place, the **cultural and identity dimension**: Dutch Calvinism not only produced institutions and behaviours; it produced a culture — a constellation of values, practices, narratives, and symbols — that shaped the collective character of the nation in an enduring manner. The pragmatic tolerance of Amsterdam, the moral seriousness of the Dutch bourgeoisie portrayed in the group portraits of Rembrandt and Hals, the scientific meticulousness of van Leeuwenhoek and Huygens, the legal sagacity of Grotius — all these expressions of the Dutch genius of the Golden Age are unthinkable without the cultural underpinning that Calvinism provided.

The subsequent trajectory of the Netherlands — from the Calvinist fervour of the seventeenth century to the almost complete secularisation of the twenty-first century — does not invalidate this legacy; rather, it transforms it into a fascinating paradox. A religious tradition that valued education, critical reason, the questioning of authorities, and the autonomy of the individual before God prepared the ground, inadvertently, for its own supersession by secular modernity. The values of tolerance, pluralism, universal education, and limitation of state

power, which the Reformation implanted in Dutch culture, survived and prospered even when the religious faith that had generated them retreated to the margins of public life.

This is, perhaps, the most profound teaching of the Dutch case: ideas have consequences that transcend the intentions of their authors and the currency of the beliefs that generated them. The Protestant Reformation in the Netherlands was a singular historical event, unrepeatable in its specific form, but whose lessons for the present are perennial: education as the commitment of a community to its own future; the limitation of power as a safeguard of human dignity; tolerance as a condition of collective prosperity; and faith — any authentic faith — as a force capable of moving not only mountains, but entire nations.

PRESIDENTIALISM AND DEMOCRACY IN LATIN AMERICA

PRESIDENCIALISMO E DEMOCRACIA NA AMÉRICA LATINA

PRESIDENCIALISMO Y DEMOCRACIA EN AMÉRICA LATINA

10.56238/sevened2026.019-115

José Lucio Santos Gorayeb¹**ABSTRACT**

This paper addresses the concepts of Latin America, democracy and presidentialism, including coalition presidentialism, providing a brief comparison with Parliamentarism. It presents impressions published in scientific articles and the media regarding the impeachment of the Brazilian President Dilma Roussef and the trial/conviction of Jair Bolsonaro for attempting a coup d'état. The objective is to theoretically examine the relationship between presidentialism, democracy and Latin America, while analysing the two aforementioned cases. The methodology employed is bibliographic, relying on books, scientific articles, and trial records. The study concludes that in presidentialism, it is necessary for the President to possess special political skills to remain in office, but the respect for constitutional rules is a must.

Keywords: Presidentialism. Democracy. Latin America. Impeachment. Coup D'État.

RESUMO

Este artigo aborda conceitos de América Latina, democracia e presidencialismo, incluindo o presidencialismo de coalizão. Faz-se breve comparação com o Parlamentarismo. Traz-se impressões publicadas em artigos científicos e nos média acerca do impeachment sofrido pela Presidenta do Brasil Dilma Roussef e no julgamento e condenação do Presidente Jair Bolsonaro por golpe de estado, dentro outros crimes. O objetivo é tratar teoricamente da relação entre presidencialismo, democracia e América Latina, além de analisar os casos mencionados. A metodologia é bibliográfica (livros, artigos científicos e atas de julgamento). Conclui-se que no presidencialismo é necessário que o Presidente tenha especial habilidade política para conseguir se manter no poder, mas o respeito às regras constitucionais e legais é de rigor.

Palavras-chave: Presidencialismo/ Democracia. América Latina. Impeachment. Golpe de Estado.

RESUMEN

Este artículo aborda los conceptos de América Latina, democracia y presidencialismo, incluido el presidencialismo de coalición. Se realiza una breve comparación con el Parlamentarismo. Se presentan impresiones publicadas en artículos científicos y en los medios de comunicación acerca del impeachment sufrido por la Presidenta de Brasil Dilma Roussef y sobre el juicio y condena del Presidente Jair Bolsonaro por golpe de estado, entre otros delitos. El objetivo es tratar teóricamente la relación entre presidencialismo, democracia y América Latina, además de analizar los casos mencionados. La metodología es bibliográfica (libros, artículos científicos y actas de juicio). Se concluye que en el presidencialismo es necesario que el Presidente posea especial habilidad política para lograr mantenerse en el poder, pero el respeto a las reglas constitucionales y legales es de rigor.

1 INTRODUCTION

The proposed theme combines three topics whose definitions are, in the case of the first, easier to understand and more uniformly defined among authors. *Democracy* and *Latin America*, however, require somewhat more debate concerning their nature and contours. The present *paper* will begin by addressing the concepts of each topic, passing through some problematisation or theoretical variation, limiting itself to mentioning specific examples of questions linked to real cases that occurred in the region.

Although in the title Latin America comes in third place, it was decided to begin the text by trying to understand what it is, its emergence and geopolitical context.

Subsequently, presidentialism will be dealt with based mainly on Juan Linz and Scott Mainwaring. It is impossible, on the other hand, to speak of presidentialism without recalling the separation of powers, for which the theory disseminated by Montesquieu is unavoidable. A brief description is made of “coalition presidentialism”, the Brazilian case. The advantages and disadvantages of the system of government unanimously chosen in this part of the globe are discussed. As a counterpoint, parliamentarism is superficially addressed.

Regarding democracy, an approach is taken concerning its varied meanings, from Abraham Lincoln, Robert Dahl and Guillermo O'Donnell.

The methodology used is bibliographic research (articles and books). It is concluded that political instability is quite present in the region, that the presidentialist system requires special political skill from the office-holder, and that it opens opportunities for authoritarianism.

2 LATIN AMERICA

For the purposes of the “regional report on Latin America and the Caribbean” of 2001, by the UNESCO Institute for Statistics of 2001, the term Latin America is a convention; it generally refers to that group of countries of continental America and the Caribbean whose inhabitants speak Spanish or Portuguese, composed of 19 republics: Argentina, Bolívia, Brasil, Chile, Colômbia, Costa Rica, Cuba, República Dominicana, Ecuador, El Salvador, Guatemala, Honduras, México, Nicaragua, Panamá, Paraguai, Peru, Uruguai and Venezuela.

It must not be forgotten that, in addition to the languages of the coloniser, many languages of the indigenous peoples are spoken in the region.

Bethell (2009) affirms that the term derives from the French *Amérique Latine*, used at the beginning of the 1800s by French intellectuals to refer to imperialism in Mexico under Napoleon III. However, Morse (1988) argues that Napoleon III would only have used this term 400 years after the discovery of the West Indies, with the aim of creating an alleged linguistic

and cultural unity of the Latin peoples, in opposition to Germanic, Anglo-Saxon and Slavic peoples.

Espinosa-Dassonneville (2022) asserts:

[...] le mot et l'idée d'« Amérique latine » ont été utilisés la première fois à Paris en 1856 sous la plume des écrivains Francisco Bilbao (Chilien) et José María Torres Caicedo (Colombien). Au nom d'une « conscience » latino-américaine, éveillée grâce à l'antithèse saxon/latin, ils dénoncent le matérialisme et l'impérialisme des États-Unis qui prétendent apporter le progrès et la civilisation [...]. Enfin, c'est le diplomate argentin Carlos Calvo qui a utilisé officiellement l'expression « Amérique latine » pour son *Recueil complet des traités* publié à Paris (1862) et dédié à Napoléon III, « le souverain de l'Europe qui a le mieux compris toute l'importance de l'Amérique latine »².

The concept of Latin America is born as a term in favour of the political and economic interests of Napoleon III, as well as by the need to impose France as a counterpoint against the growing influence of the United States. It is these geopolitical circumstances that will give rise to the idea according to which Latin America is a French invention, because in fact France was primarily the promoter and disseminator of the concept (TORRES MARTINEZ, 2016)

3 DEMOCRACY

In antiquity, in Herodotus, Democracy was a form of government, alongside other forms of government: monarchy (the government of only one) and aristocracy (the government of a few) (ROSENFELD, 1984).

The French Revolution retook the classical Greek notion of democracy, giving the world the modern notion of the State. The influence of France on what is understood by politics, State and democracy is vast. Eric Hobsbawm teaches, regarding the political conformation of the modern State:

If the economy of the nineteenth-century world was formed mainly under the influence of the British industrial revolution, its politics and ideology were formed fundamentally by the French Revolution. Great Britain provided the model for the railways and factories, the economic explosive that broke down the traditional socio-economic structures of the non-European world; but it was France that made its revolutions and gave them their ideas, to the point that tricolour flags of one kind or another became the emblem of virtually every emerging nation, and European (or even world) politics between 1789 and 1917 was largely the struggle for and against the principles of 1789, or the even more incendiary ones of 1793. France provided the vocabulary and the themes of liberal and radical-democratic politics for most of the world. France gave the first great example, the concept and the vocabulary of nationalism. France provided the legal codes, the model of technical and scientific organisation and the

² In free translation: The word and the idea of "Latin America" were used for the first time in Paris, in 1856, by the writers Francisco Bilbao (Chilean) and José María Torres Caicedo (Colombian). In the name of a Latin American "consciousness" awakened by the Saxon/Latin antithesis, they denounce the materialism and imperialism of the United States, which claim to bring progress and civilization [...]. Finally, it was the Argentine diplomat Carlos Calvo who officially used the expression "Latin America" in his work "*Recueil complet des traités*", published in Paris in 1862 and dedicated to Napoleon III, "the sovereign of Europe who best understood the full importance of Latin America".

metric system of measurement for most countries. The ideology of the modern world reached the ancient civilisations which had until then resisted European ideas initially through French influence. This was the work of the French Revolution (HOBBSAWM, 1962).

The French Revolution is a landmark in every country. Its repercussions, unlike those of the American revolution, brought about the uprisings that led to the liberation of Latin America after 1808 (Hobsbawm, 1962).

Some meanings that are held of the term Democracy are: a) democracy is “the government of the people, by the people and for the people”, which appeared in Abraham Lincoln's speech at a ceremony held in Gettysburg on 19/11/1863 (Lincoln, 1863); b) democracy as a deliberative process: this concept holds that democracy is not only a matter of elections of political representation, but also of dialogue and deliberation among free and equal citizens (Habermas et. al, 1996); c) democracy as equality of opportunity: this concept focuses on the idea that democracy must guarantee equality of opportunity for all citizens, regardless of their social and economic origins (Rawls, 1971); d) participatory democracy: this concept highlights the importance of the active participation of citizens in political decision-making and public management, going beyond the simple right to vote and elect representatives (Santos, 2005); e) democracy as political culture: these views emphasise the importance of a democratic political culture, with values and practices that promote tolerance, dialogue, diversity and social justice (SEN, 2010).

Oliveira (2020) argues that the classical models proposed by the theoretical currents of transitology and consolidology do not explain Latin America, the model of delegative democracy being the one closest to the reality of the region.

The models of consolidology and transitology are two theoretical approaches used to analyse the process of democratic consolidation and transition in different countries. Consolidology departs from the idea that democracy is a gradual process, in which political institutions are consolidated over time, whereas transitology understands the transition to democracy as an abrupt and singular process.

In Latin America, the theories of consolidology and transitology were widely used to analyse the process of democratisation in different countries of the region. Linz & Stepan (1996) argue that the region underwent an incomplete democratic transition, characterised by institutional fragility and by the weakening of civil society. Mainwaring & Pérez-Liñán (2013) hold that democracy in the region is marked by the persistence of authoritarian practices and by political corruption.

Among the enormous and often impenetrable thickets of ideas about democracy, Dahl (1998) states that there are at least 5 criteria for considering that democracy exists, using a fictitious association as an example:

- a) Effective participation: before a given policy is adopted, all members must have equal and effective opportunities to give their view to the other members concerning such policy;
- b) Equality in voting: at the moment of deciding which policy to adopt, each member must have an equal and effective opportunity to vote, and all votes must have the same weight;
- c) Enlightened understanding: within reasonable limits of time, each member must have equal and effective opportunities to learn more about the alternative policies and their probable consequences;
- d) Control of the agenda: the members must have the exclusive opportunity to decide how and, if they prefer, which matters will be part of the agenda. In this way the democratic process required for the first three criteria is never closed. The Association's policies are always open to changes, if the members so decide;
- e) Inclusion of adults: most, if not all permanent adult residents must have full rights of citizens that are implicit in the first four criteria. Before the twentieth century this criterion was not accepted by most defenders of democracy. (MAINWARING & PEREZ-LIÑAN, 2013).

O'Donnell (1994) establishes his criteria for verifying the democracy of a country:

1. Free and fair elections: Citizens must have the right to vote in elections that are free and fair, without coercion or intimidation, and where each citizen's vote has the same weight.
2. Popular participation: Democracy must allow the active participation of citizens in political life, not only through elections, but also through other forms of participation, such as protests, petitions and referendums.
3. Respect for civil liberties: Democracy must guarantee freedom of expression, freedom of association and freedom of the press, in addition to protecting human rights and minorities.
4. Accountability of the government: The government must be accountable to the people and subject to laws that limit and control its power.
5. Control of power: Democracy must guarantee the separation of powers and the existence of independent institutions, such as the judiciary and the press, which can oversee and limit the power of the government. (O'DONNELL, 1994).

Oliveira (2020) reports that O'Donnell (1988) added three criteria to his five aforementioned ones: “(6) elected authorities must not be removed before the end of the mandate; (7) elected officials cannot be subject to non-elected officials, such as the armed forces and; (18) territory that clearly defines the voting position”.

4 PRESIDENTIALISM

Montesquieu (2008) teaches that there are three species of government: Republic (in which the people in general, or only a part of them, holds sovereign power); Monarchy (in which only one governs, but by fixed and established laws); Despotism (a single one, without law and without rule, does everything by his own will and his caprices).

Paul Janet, editor of *The Spirit of the Laws*, clarifies that the first thinker to mention the separation of powers was Aristotle, reproduced by Locke and repeated by Montesquieu (Montesquieu, 2008). It is important to bear in mind the separation of powers, because presidentialism is generally based on this idea (CHEIBUB et.al., 2017)

A presidentialist democracy has two characteristics. First, the head of government is elected independently of the parliament, that is, legislative elections and post-electoral negotiations do not determine the executive power (unlike Parliamentarism, where post-electoral negotiations will define which parties will govern and who the leaders will be). The head of the executive is normally elected by popular vote (but there are exceptions, such as the United States, where the vote takes place by electoral college, but even there the popular vote conditions the electoral college). The second characteristic of presidentialist democracies is that the President is elected for a fixed-term mandate, although most democracies exceptionally permit *impeachment*. The President cannot be deposed by a vote of no confidence of the parliament, so that the president cannot be formally held accountable by Congress (MAINWARING, 1990).

Presidentialism is defined by at least one of the following criteria: a) election of the Head of State by popular choice, direct or indirect and for a fixed period; b) the Parliament cannot appoint nor reappoint the government; c) the Head of State is also the Head of Government. However, for there to be so-called “pure presidentialism” these must be present at the same time. Thus, a system is presidentialist if, and only if, i) the choice of the president results from popular elections, ii) during the mandate he cannot be dismissed by the parliamentary vote and iii) he heads the government or governments appointed by himself (SARTORI, 1992).

In comparison, in a parliamentary system, the head of government is elected by the Legislature and, consequently, depends on the confidence of the latter over time to remain in

the function, and for this reason the period is not fixed. This idea also approximates French semi-presidentialism, for example, where the executive power is divided between the President (elected by the people) and the Prime Minister (MAINWARING, 1990).

Bobbio *et al* (1998) teach that “the classical bipartition distinguishes the parliamentary Form of Government and the presidential Form of Government”, presidentialism being typical only of the republican system, whereas parliamentarism (or, as the author prefers, the Parliamentary Form of Government) can be found both in monarchical systems and in republican systems.

Latin America had parliamentarist governments in Brazil (1961-1963) and in Chile (1891-1924), but “the Latin American experiences sometimes called parliamentarism are in reality presidentialist systems” (MAINWARING, 1990, p. 159).

America (not only Latin America) is the stage of a totally original structure regarding the very clear separation between the Executive and the Legislature, which is the presidentialist regime. In the parliamentarism seen in Europe, this differentiation between who exercises the executive function and the legislative function is much less accentuated, “inasmuch as the Government is composed of deputies, who answer for their action, directly before the assembly or assemblies and, only indirectly, before the elections” (BOBBIO *et. al*, 1998, p. 249)

As the democracies of Western Europe presented stability and strong economic development, whereas in Latin America there were coups d'état, autocratic governments and military dictatorships – in addition to the serious social and economic problems of the region –, these problems are associated with presidentialism. Linz understands that presidentialism, as another characteristic, hinders accountability. How, he asks, is one to punish through the vote a president who can no longer be re-elected? The punishment would fall on the party, which is not fair, since the president may have governed with independence from party ties. In any case, the voters have to wait for the end of the mandate to demand accountability, whereas in parliamentarism the vote of censure can be presented against the prime minister by the Parliament and by his own party.

Juan Linz is critical of presidentialism, basing himself on five factors: 1) the president and the parliament fight for legitimacy; both are elected by popular vote, so that the survival of each is independent of the other; 2) the fixed-term mandate offers a rigidity less favourable to democracy than the flexibility offered by parliamentarist systems; 3) presidentialism introduces an “all or nothing”, where one wins and the other loses, whereas in parliamentarism there is a division of power and a formation of coalition where even the smaller parties obtain something for themselves; 4) the style: the president being the

representative of the whole nation may make him intolerant of the opposition; the sensation of having an independent mandate, granted by the people, may generate an excessive idea of power and divert him from the perception that he was elected by a plurality; 5) the “outsiders” are more prone to win the office, with destabilising powers. These lessons of Linz are contained in Mainwaring and Shugart (1997).

On the fight for legitimacy between President and Legislature in presidentialism, which he denominates “dual power”, Linz teaches:

“Sin entrar en la complejidad de la relación entre el ejecutivo y el legislativo en distintos regímenes presidenciales, los peligros relativos del predominio de uno o otro y la capacidad de vetar o paralisar decisiones sobre legislación, no cabe duda de que los regímenes presidenciales están basados en una legitimidad democrática dual y que ningún principio democrático puede decidir quién representa la voluntad popular en principio. En la práctica, y especialmente en países en vías de desarrollo con grandes desigualdades regionales en modernización, es muy probable que la composición y las opiniones políticas y sociales del legislativo sean distintas de las de los que apoyan al presidente” (LINZ *in* LINZ & VALENZUELA, 1998, p.35).

On the legal difference between presidentialism and parliamentarism, Bobbio teaches:

At a more superficial level is placed the distinction founded on the juridical-institutional criterion between presidential regime and parliamentary regime. The difference between the two regimes lies in the different relationship between legislature and executive. Whereas in the parliamentary regime the democraticity of the executive depends on the fact that it is an emanation of the legislature, which, in turn, is based on the popular vote, in the presidential regime the head of the executive is elected directly by the people. In consequence of this he renders accounts of his action not to the Parliament but to the voters who can sanction his political conduct by denying him re-election. (Bobbio, 1998, pg 327).

It is worth mentioning that Cadena and Gayoso bring the thinking of Nolan, Carpizo and Zovatto & Orozco, regarding the difference between hyperpresidentialism, pure presidentialism and attenuated presidentialism, as follows: in hyperpresidentialism the Constitution confers upon the president a considerable amount of powers; in pure presidentialism the original characteristics are maintained; in the attenuated one, the powers are constitutionally balanced between Executive and Legislature; whereas parliamentarised presidentialism incorporates mechanisms proper to parliamentarist systems, such as the vote of censure against ministers, the ratification of some members of the cabinet by the Legislature and the permanence of a collegiate Executive (Nohlen, 1998; Zovatto and Orozco, 2009; Carpizo, 1978, *in*: Cadena and Gayoso, 2016).

Let us deal with Coalition Presidentialism, a term coined by Sérgio Abranches in an article published in the year of the promulgation of the most recent Constitution of Brazil, 1988. According to the author, Executive and Legislature are always in conflict, this conflict

having as its basis 5 historical formative elements of the arrangement between the institutions: presidentialism, federalism, bicameralism, multipartism and proportional representation. (1988).

The coalition presidentialism that takes place in Brazil is unique in the world. Most of the democracies of the second post-war period are parliamentarist, the United States being the only purely presidentialist one. France presided over by De Gaulle was presidentialist, but of the mixed type, where the parliament could dismiss the ministry. Finland is technically considered a cabinet regime, since the presidential cabinet can be dissolved by the parliament. In Switzerland there is no vote of confidence, but it is a Federal Council of seven members elected by the parliament that is the head of the Executive. (ABRANCHES, 1988).

Brazil has many political parties because its cultural and social variety is enormous. There is a correlation between party fragmentation, social diversity and greater probability of large coalitions. "Brazil is the only country that, in addition to combining proportionality, multipartism and 'imperial presidentialism', organises the Executive on the basis of large coalitions" (ABRANCHES, 1988, p. 21).

The author published a new work on the theme, 30 years after the article above, that is, 2018. He seems to declare that coalition presidentialism would be a kind of hybrid system of government, with the fusion of characteristics of presidentialism and parliamentarism, as follows:

"It is no surprise that in the impasse between parliamentarists and presidentialists the compromise solution converged towards coalition presidentialism. Not as a preferential choice, but rather by reciprocal rejection of the alternatives. In the Brazilian circumstances, the choice for multiparty presidentialism materialises in coalition presidentialism" (ABRANCHES, 2018).

5 HOW TO DISMISS THE PRESIDENT? THE CASE OF DILMA ROUSSEFF

Since the president is elected for a fixed term, an established period, it is not part of the normal plans to dismiss this president, who has the right to fulfil their mandate, in respect of the votes received. However, the motion of censure, typical of parliamentarism, was gradually being inserted into the constitutions of 14 countries of Latin America, with the exception of Brazil, Chile, Honduras and Mexico. As for the vote of confidence, it was implemented only by Peru, the Dominican Republic and Uruguay (Cadena and Gayoso, 2016).

Ganghof argues that the methods for dismissing a president should be feasible and effective, as follows:

Given the direct power that modern chief executives have over their citizens, their dismissal should be feasible and effective. Direct recall and impeachment do not score highly on these criteria (e.g. Ginsburg *et al.* 2020; Pérez-Liñán 2020). The most

fundamental reason is arguably the same for both procedures: they often lack what we might call political neutrality. That is, they are extraordinary procedures that tend to inexorably connect the ousting of the chief executive to the more general power struggle between competing political forces in society. They are, in fact, not just procedures for replacing the chief executive but potentially allow the losers of the last election to change the electoral outcome or, at least, to hurt the winners politically. This lack of neutrality can give rise to deeply divisive and traumatic struggles between the political forces that support presidents and those that oppose them (Ganghof, 2021, pg. 156)³.

For those who defended the impeachment of President Dilma, the legal arguments needed to demonstrate that she had committed the crime of responsibility. The points alleged in the petition were a) fiscal manoeuvres, not provided for in law, carried out by the government, consisting of the delay in the transfer of funds from the National Treasury to private and public banks, in order to relieve the government's fiscal situation for a certain time (these measures became known as “fiscal pedalling”); b) issuance of decrees establishing the release of supplementary credits without authorisation from the Parliament. Thus, she would fall under the Law of Responsibility (No. 1079/50, which defines the crimes of responsibility and regulates the respective process and trial of presidents of the republic).

In her defence, sponsored by the Advocacia-Geral da União, Dilma Rousseff alleges that the *impeachment* process is in fact a coup d'état. Let us look at an excerpt:

It is common to use the expression “coup d'état”, in all continents (“Coup d'État”, “Staatsreich”), to define the situations in which the deposition occurs, by means not admitted by the legal order, of a legitimate government. Although, on the historical plane, the materialisation of coups by force of arms is more common, one also cannot ignore that, many times, and especially in the days that follow, such institutional ruptures are woven and executed under the apparent mantle of “legality”. This will occur whenever, under the rhetorical allegation of the occurrence of situations that in fact do not exist or do not justify in law the cassation of a presidential mandate, legal subterfuges, unfounded and unwarranted arguments are sought for the apparent legal legitimisation of the deposition of a government, without there being any constitutional basis for that. In these cases, tanks, bombardments, cannons or machine guns will not be used. False, mendacious legal arguments will be used, seeking to replace the violence of armed actions with the hollow and hypocritical words of those who feign to be democrats the better to trample democracy at the moment when this serves their interests. The Constitution is invoked, only for it to be torn up with elegance and without noise. (Camara Legislativa, 2016).

This trial, as is known, is essentially political, even though it is necessary to fit the conduct of the president, in the case of Brazil, within the Law of Responsibility. The votes of the 367 parliamentarians in favour of the impeachment, nevertheless, had as their foundation motives that were not at all legal, such as God, family, homage to a torturer, respect, conscience. Certainly, the word corruption was much used in the votes (in tune with the word used many and many times in the mainstream media), but outside its legal sense. At no point, in the votes, was an article of law sought that describes an act of corruption (however there

³ In free translation

exists Law No. 12,946 of 2013, which brings acts harmful to the National or Foreign Public Administration in articles 5 and following). Once the process was admitted in the Chamber of Deputies, the process went to the Federal Senate, where it was confirmed as admissible, by 59 Senators in favour, 21 against, no abstention (Senado Federal, 2016).

The final sentence, in its operative part (that is, the decisive part, without the long reports), was as follows:

The Federal Senate understood that Madam President of the Republic Dilma Vana Rousseff committed the crimes of responsibility, consisting of contracting credit operations with a financial institution controlled by the Union and issuing supplementary credit decrees without authorisation from the National Congress, provided for in art. 85, item VI, and art. 167, item V, of the Federal Constitution, as well as in art. 10, items 4, 6 and 7, and art. 11, items 2 and 3, of Law No. 1,079, of 10 April 1950, by 61 votes, there having been registered 20 votes against and no abstention, the accused being thus condemned to the loss of the office of President of the Federative Republic of Brazil.

In a subsequent vote, the Federal Senate decided to set aside the penalty of disqualification from the exercise of public office, by virtue of not having obtained in this vote the two thirds of the votes constitutionally provided for, there having been verified 42 votes favourable to the application of the penalty, 36 against and 3 abstentions.

This sentence, drawn up in the records of the process, shall appear in a resolution of the Federal Senate, shall be signed – the sentence – by me and by the Senators who functioned as judges, transcribed in the minutes of the session and, within these, published in the *Diário Oficial da União*, in the *Diário do Congresso Nacional*, according to art. 35 of Law No. 1,079, and in the *Diário do Senado Federal*.

Such decision formally concludes the *impeachment* process instituted against the President of the Republic in the Federal Senate, on 12 May 2016.

Let the communications be made to His Excellency the acting President of the Republic, to Their Excellencies the Presidents of the Chamber of Deputies, of the Federal Senate and to Her Excellency the Vice-President of the Federal Supreme Court, 31 August 2016. I sign the sentence. (*Applause.*) (Senado Federal, 2016).

It is noted that in Brazil this type of trial, as already mentioned, is political, so that it may be said that the legal argumentation is a mere excuse for the application of the sanction. This overlap would make sense if *impeachment* in Brazil were treated as *recall* and not as a crime of responsibility. However, Masturcelli (2020) points out that this expedient serves as political blackmail and even as a “constitutional coup” against a president of the Republic, it being sufficient to “count on the activism or acquiescence of the Judiciary, legitimising the thesis that everything is working as the Federal Constitution preaches, and the qualified majority of 2/3 in the National Congress coming to approve the process” (MASTURCELLI, 2020).

6 JAIR BOLSONARO: THE FATEFUL 8 JANUARY 2023

After the result of the ballots in the Brazilian general elections of October 2022 had announced that Luis Inácio Lula da Silva had come out the winner, Jair Bolsonaro and his accomplices decided to gather a crowd to invade and vandalise the Federal Supreme Court, the Palácio do Planalto (seat of the Executive Power) and the National Congress.

It was evidently a quite prepared movement and with the necessary anticipation. Between 4 and 5 thousand people (Costa, 2024) marched towards the Praça dos Três Poderes. Probably the leaders of this criminal march were inspired by Donald Trump, who had previously led an invasion of the Capitol, in Washington. Unlike the United States of America, however, Brazil tried its perpetrators, ending up convicting them.

At 8:20 a.m., alerts from the Brazilian Intelligence Agency reported the arrival of 101 buses in Brasília. At 10 a.m., a new alert regarding the arrival of demonstrators, with incitements to move towards the Esplanada dos Ministérios. At 1 p.m., a march with thousands of people set out from the camp of the Setor Militar Urbano (Costa, 2024).

At 1:23 p.m. the substitute of the Secretary of Public Security of the Federal District sends an audio to the then Governor of the Federal District, Ibaneis Rocha, reassuring him. At 3:12 p.m. Military Police of the 2nd Riot Policing Platoon arrived at the Congress, but did not repress the invaders, having even gone so far as to make gestures for them to proceed (Costa, 2024).

The invaders, saying that they did not accept the result of the elections, used violence against property of inestimable and above all symbolic value. Inside the buildings, they broke furniture, tore works of art off the walls, destroyed glass windows, lamps, chairs, carpets. They filmed their actions and proudly posted them on social networks (which greatly helped in the police investigations).

The Federal Supreme Court accounted for losses exceeding twelve million reais, with 951 items stolen, broken or completely rendered useless. In the Congress, a loss of almost 5 million reais; in the Palácio do Planalto, registered damages of more than 4 million reais. In money, a loss of 21 million reais – or approximately 3.5 million euros – caused in a single afternoon (MPF, s.d.).

Several authorities were convicted, among them military personnel of the highest rank, but we shall focus our attention on the conviction of the former President Bolsonaro, since the scope of the present article is presidentialism.

If the crimes of damage and destruction of public patrimony were enormous, even greater dimension had the crimes against democracy itself.

The trial, which mobilised the nation and had live televised transmission, took place in nuclei. Jair Bolsonaro was part of the “crucial nucleus”, responsible for the planning and organisation of the coup acts (Supremo Tribunal Federal, Ação Penal 2668). According to the Attorney General's Office of the Republic (Ministério Público Federal, which brought the action), Jair Bolsonaro participated in the formulation and drafting of coup drafts and was fully aware of (approving it) the “Punhal Verde e Amarelo” plan, which intended to kill the elected president Lula, the elected vice-president Geraldo Alckmin and the STF minister Alexandre de Moraes.

Jair Bolsonaro was convicted of the crimes of leadership of a criminal organisation, attempt at the violent abolition of the democratic rule of law, coup d'état, damage against the patrimony of the Union and deterioration of listed patrimony.

The STF decided

TO CONVICT, by majority, the Minister Luiz Fux being outvoted, the defendant **Jair Messias Bolsonaro** for infractions of the articles: art. 359-L; art. 359-M; art. 163, sole paragraph, I, III and IV, all of the Penal Code; art. 2, *caput*, §§ 2, 3 and 4, II, of Law No. 12,850/2013 and art. 62, I, of Law No. 9,605/1998, in the form of art. 29, *caput*, and of article 69, *caput*, both likewise of the Penal Code. Totalling the custodial sentence, DEFINITELY, at **27 (twenty-seven) years and 3 (three) months, being 24 (twenty-four) years and 9 (nine) months of imprisonment (reclusão) and 2 (two) years and 6 (six) months of detention**, the initial closed regime being applied for the beginning of serving the sentence of the hereby convicted, in the form of art. 33, of the CP. Also sentenced to the pecuniary penalty of **124 (one hundred and twenty-four) day-fines**, which shall be calculated at the rate of 2 (two) minimum wages, in force at the time of the fact, duly adjusted, under the terms of article 49, § 1, of the CP (STF, AP 2668, s.d.)

7 CONCLUSIONS

Presidentialism is the regime of government unanimously adopted in Latin America, and it is possible to associate it with political instabilities and military dictatorships. In order to obtain success, the President needs to make an abundant distribution of positions and exchanges to the parties that make up the Legislature, allies and members of the opposition, in order to achieve some viability in the task of governing. This requires much skill from the President, who ideally will still keep within the dictates of democracy. When this limit is exceeded, then what is seen is the purchase of alliances, threats to destroy enemies, to destroy the free press, being able to reach coups.

If the president is merely unpopular, they will not be re-elected, having then been “punished” at the ballot box. There is no regular way to expel the president before the end of the mandate. Moreover, exceptionally there is *impeachment*, much more traumatic for the president and for the country. What cannot be accepted, and Brazil did not accept, is the practice of coup d'état.

ABSTRACT

This article examines the theoretical and normative foundations of reproductive self-determination from the perspective of contemporary constitutionalism and feminist constitutionalism. It argues that reproductive decisions transcend the private sphere and constitute a matter of constitutional justice directly linked to human dignity, liberty, equality and health. The study analyses the international development of reproductive rights through the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), the International Conference on Population and Development (Cairo) and the Beijing Platform for Action. It also explores the contribution of feminist theories and Martha Nussbaum's capabilities approach to understanding reproductive autonomy as an essential condition for citizenship and substantive equality. Finally, it argues that reproductive self-determination should be recognized as an implicit fundamental right within the Brazilian constitutional order.

Keywords: Reproductive Self-determination. Fundamental Rights. Feminist Constitutionalism. Human Dignity. Bodily Autonomy.

RESUMO

O presente artigo analisa os fundamentos teóricos e normativos da autodeterminação reprodutiva a partir da perspectiva do constitucionalismo contemporâneo e do constitucionalismo feminista. Parte-se da compreensão de que as decisões relacionadas à reprodução ultrapassam a esfera privada e constituem questão de justiça constitucional diretamente vinculada à dignidade da pessoa humana, à liberdade, à igualdade e à saúde. O estudo examina a progressiva internacionalização dos direitos reprodutivos por meio da Convenção sobre a Eliminação de Todas as Formas de Discriminação contra a Mulher (CEDAW), da Conferência Internacional sobre População e Desenvolvimento do Cairo e da Plataforma de Ação de Pequim. Analisa-se, ainda, a contribuição das teorias feministas e da abordagem das capacidades desenvolvida por Martha Nussbaum para a compreensão da autonomia reprodutiva como condição indispensável para a efetivação da cidadania e da igualdade material. Sustenta-se que a autodeterminação reprodutiva pode ser reconhecida como direito fundamental implícito no ordenamento constitucional brasileiro, decorrente da articulação entre dignidade humana, liberdade, igualdade, privacidade, saúde e planejamento familiar.

Palavras-chave: Autodeterminação Reprodutiva. Direitos Fundamentais. Constitucionalismo Feminista. Dignidade Humana. Autonomia Corporal.

RESUMEN

El presente artículo analiza los fundamentos teóricos y normativos de la autodeterminación reproductiva desde la perspectiva del constitucionalismo contemporáneo y del constitucionalismo feminista. Se parte de la comprensión de que las decisiones relacionadas con la reproducción sobrepasan la esfera privada y constituyen una cuestión de justicia constitucional directamente vinculada a la dignidad de la persona humana, a la libertad, a la igualdad y a la salud. El estudio examina la progresiva internacionalización de los derechos reproductivos a través de la Convención sobre la Eliminación de Todas las Formas de Discriminación contra la Mujer (CEDAW), de la Conferencia Internacional sobre Población y Desarrollo de El Cairo y de la Plataforma de Acción de Pekín. Se analiza, además, la contribución de las teorías feministas y del enfoque de las capacidades desarrollado por Martha Nussbaum para la comprensión de la autonomía reproductiva como condición indispensable para la efectivización de la ciudadanía y de la igualdad material. Se sostiene que la autodeterminación reproductiva puede ser reconocida como derecho fundamental implícito en el ordenamiento constitucional brasileño, derivado de la articulación entre dignidad humana, libertad, igualdad, privacidad, salud y planificación familiar.

Palabras clave: Autodeterminación Reproductiva. Derechos Fundamentales. Constitucionalismo Feminista. Dignidad Humana. Autonomía Corporal.

1 INTRODUCTION

The constitutionalisation of matters relating to reproduction represents one of the most significant transformations of contemporary constitutionalism. Themes historically treated as belonging to the private, moral or religious sphere have, in recent decades, come to form part of the core of constitutional debates concerning the protection of fundamental rights. This shift stems from the growing perception that decisions relating to sexuality, motherhood, contraception and family planning do not constitute merely individual choices devoid of public relevance, but directly influence the realisation of liberty, equality, health and human dignity.

For much of constitutional history, reproduction was understood as a dimension linked to family organisation and social morality, remaining relatively removed from the field of fundamental rights. The classic liberal distinction between the public and private spheres contributed to matters relating to the female body being treated as issues foreign to constitutional oversight, even when subjected to intense mechanisms of legal, religious and political regulation. The critique developed by feminist theories throughout the twentieth century revealed, however, that the apparent neutrality of this separation concealed structural power relations that profoundly conditioned women's reproductive experience.

From the second half of the twentieth century onwards, the strengthening of feminist movements and the progressive internationalisation of human rights contributed to transforming reproduction into a legitimate object of constitutional protection. International conferences, multilateral bodies and constitutional courts came to recognise that reproductive autonomy constitutes an indispensable condition for the realisation of gender equality and the full exercise of citizenship. In this context, the understanding was consolidated that the freedom to decide whether, when and under what circumstances to have children forms part of the set of existential choices constitutionally protected.

The recognition of reproductive rights, however, remains marked by intense legal, political and moral controversies. The protection of reproductive autonomy frequently comes into tension with arguments relating to the protection of potential life, public morality, religious convictions and the limits of state intervention over the human body. These disputes reveal that reproduction constitutes one of the most complex themes of contemporary constitutional theory, requiring the articulation of different fundamental rights and constitutional principles.

In light of this scenario, this article aims to analyse the constitutional foundations of reproductive self-determination, investigating whether it is possible to recognise it as an implicit fundamental right within the Brazilian constitutional order. To this end, it draws on the contribution of feminist constitutionalism and the theory of fundamental rights, examining the

internationalisation of reproductive rights, their relationship with human dignity and bodily autonomy, as well as the normative foundations that sustain their constitutional protection.

The hypothesis defended is that reproductive self-determination constitutes a fundamental right materially protected by the Constitution of the Republic of 1988, even though it is not expressly provided for in its formal catalogue of fundamental rights. Its protection derives from the systematic interpretation of the constitutional principles of human dignity, liberty, equality, privacy, health and family planning, as well as from the commitments assumed by the Brazilian State within the international framework of human rights.

2 REPRODUCTION AND CONSTITUTIONAL JUSTICE

For a long period, matters relating to reproduction were understood as issues belonging to the private sphere of human life. Pregnancy, motherhood, family planning and the raising of children were traditionally treated as themes linked to morality, religion and family organisation, remaining relatively removed from constitutional debate. This perception was influenced by the classic liberal separation between the public and private spheres, according to which constitutional law should concentrate on the organisation of the State and the protection of civil liberties, reserving a reduced space of legal intervention for family relations.

However, the apparent neutrality of this division proved insufficient to understand the power relations that historically shaped women's reproductive experience. As demonstrated by the feminist theories developed throughout the twentieth century, the location of reproduction in the private sphere did not mean the absence of state regulation. On the contrary, it allowed legal, political, religious and cultural mechanisms to operate intensely upon female bodies without the scrutiny proper to constitutional guarantees.

In this context, reproduction came to be understood not only as an individual or family experience, but as a phenomenon directly related to the distribution of power, resources and opportunities in a given society. The possibility of deciding whether, when and under what circumstances to have children significantly influences the insertion of women in educational, professional, economic and political spaces. Reproduction ceases to be perceived exclusively as a biological event and assumes its own constitutional relevance, insofar as it conditions the exercise of various fundamental rights.

Juliana Cesario Alvim Gomes observes that rights relating to sexuality and reproduction cannot be analysed solely from the perspective of abstract individual liberty. In examining the construction of sexual rights in contemporary constitutionalism, the author holds that autonomy can only be effectively exercised when accompanied by material and

symbolic conditions of equality, affirming that personal choices tend to become progressively more autonomous “as circumstances of equal access to material, symbolic and political goods can be achieved”. Such a formulation makes it possible to understand that reproduction constitutes not only a space of liberty, but also a matter related to distributive justice and to confronting structural inequalities.

The approximation between reproduction and constitutional justice finds its foundation in the observation that restrictions on reproductive autonomy disproportionately affect historically vulnerable groups. Poor, Black, Indigenous, migrant women or those residing in regions with precarious access to health services frequently face significantly greater obstacles to exercising free and informed reproductive choices. For this reason, the constitutional analysis of reproduction cannot be limited to the formal protection of individual liberty, but equally requires consideration of the concrete conditions that enable or prevent the effective exercise of that liberty.

3 REPRODUCTIVE RIGHTS FROM THE PERSPECTIVE OF FUNDAMENTAL RIGHTS

The progressive constitutionalisation of matters relating to sexuality and reproduction led to the recognition of reproductive rights as a legal category endowed with its own autonomy within the framework of human rights and fundamental rights. Although the expression only became consolidated in the last decades of the twentieth century, especially from the Cairo (1994) and Beijing (1995) Conferences onwards, its content finds its foundation in constitutional values historically associated with the protection of human dignity, individual liberty, equality and health.

The legal construction of reproductive rights did not occur in a linear fashion. For a long period, matters relating to reproduction were treated predominantly as issues of family, moral or religious interest, remaining relatively removed from the language of fundamental rights. From the second half of the twentieth century onwards, however, the strengthening of feminist movements, the internationalisation of human rights and the broadening of the recognition of women's autonomy contributed to shifting reproduction into the field of constitutional citizenship.

In this context, reproductive rights came to be understood as the set of prerogatives that ensure individuals the possibility of deciding freely and responsibly on matters relating to reproduction, including the decision whether or not to have children, the timing of having them, the spacing between pregnancies and access to the means necessary to bring about such choices. This conception departs from restrictive interpretations that reduce reproductive rights to the protection of motherhood or the regulation of birth rates, recognising

their intimate connection with personal autonomy and the freedom of development of the personality.

The constitutional relevance of these rights derives precisely from their multifaceted nature. Reproductive rights are not exhausted in a single normative dimension, but result from the convergence of different fundamental rights that, together, ensure the protection of reproductive autonomy. Liberty, equality, human dignity, health, privacy, physical integrity and family planning constitute some of the legal bases that sustain their recognition in contemporary constitutionalism.

The understanding of reproductive rights as a complex legal category finds support in the process of internationalisation of human rights that took place throughout the second half of the twentieth century. In this sense, Flávia Piovesan highlights that the World Conference on Human Rights held in Vienna in 1993 consolidated the understanding according to which all human rights are universal, indivisible, interdependent and interrelated. According to the Vienna Declaration and Programme of Action:

“All human rights are universal, indivisible, interdependent and interrelated. The international community must treat human rights globally in a fair and equal manner, on the same footing, and with the same emphasis.”²

The importance of this formulation for reproductive rights is evident. Decisions relating to reproduction do not exclusively involve the sphere of individual liberties, nor can they be understood solely from the perspective of social rights. On the contrary, the protection of reproductive autonomy requires the simultaneous operation of different fundamental rights, including liberty, equality, health, privacy and human dignity. Reproductive rights thus constitute a concrete expression of the indivisibility of human rights.

This understanding is reinforced by Piovesan herself when she holds that the conception according to which social rights would not constitute authentic fundamental rights has been superseded. The protection of human dignity requires the recognition of the indivisibility between civil, political, economic, social and cultural rights, rejecting interpretations that attribute a hierarchy among these different normative categories.³

From this perspective, reproductive rights prove particularly illustrative of the interdependence of fundamental rights, since their realisation simultaneously presupposes protection against arbitrary interference and access to positive provisions indispensable to the exercise of reproductive autonomy.

² PIOVESAN, Flávia. *Human Rights and International Constitutional Law*. 21st ed. São Paulo: Saraiva, 2023, p. 236.

³ PIOVESAN, Flávia. *Human Rights and International Constitutional Law*. 21st ed. São Paulo: Saraiva, 2023, p. 238.

Among the foundations that make up the normative core of reproductive rights, liberty stands out initially. Reproductive liberty ensures individuals a space of self-determination to decide on matters relating to sexuality, motherhood, fatherhood and the constitution of the family. It is a specific manifestation of personal autonomy, directly linked to the free development of the personality.

However, reproductive liberty cannot be understood in an abstract manner or detached from the concrete conditions under which choices are made. As Juliana Cesario Alvim Gomes observes, one of the central questions of sexual rights consists precisely in investigating:

“To what extent should sexual rights be defined on the basis of the individual's autonomy to make choices about their own life and sexuality? To what extent do power structures limit and constrain those choices?”⁴

The author demonstrates that choices relating to sexuality and reproduction are conditioned by economic, social, cultural and institutional factors that directly influence individuals' decision-making capacity. Consequently, the protection of reproductive rights cannot be reduced to the mere absence of state intervention.

This observation leads to the second foundation of reproductive rights: equality. The effectiveness of reproductive autonomy depends on the existence of conditions that enable people to exercise their choices in an autonomous and meaningful way. In societies marked by profound inequalities of gender, race and social class, formal liberty frequently proves insufficient to ensure real autonomy.

Equality, therefore, does not act merely as a principle of prohibition of discrimination, but also as a foundation for the adoption of measures capable of removing obstacles that hinder the effective exercise of reproductive liberty. Autonomy can only be considered genuine when accompanied by material conditions that make its realisation possible.

Health constitutes another indispensable component of reproductive rights. The International Conference on Population and Development held in Cairo recognised that reproductive health involves a state of complete physical, mental and social well-being in all aspects relating to the reproductive system. It is not merely the absence of illness, but the guarantee of conditions that enable individuals to exercise control over their reproductive life.

The protection of reproductive health requires access to adequate medical services, reliable scientific information, safe contraceptive methods and qualified professional monitoring. Without these elements, reproductive liberty remains limited and incapable of producing concrete results in people's lives.

⁴ GOMES, Juliana Cesario Alvim. *Sexual rights and their legal foundation*. Rio de Janeiro: Lumen Juris, 2022, p. 41.

Privacy also plays a relevant role in the protection of reproductive rights. Decisions relating to reproduction belong to the most intimate core of the personality, which is why they must be protected against arbitrary interference by the State or by third parties. The protection of privacy ensures the space of autonomy necessary for individuals to formulate existential choices compatible with their convictions and life projects.

The interaction between liberty, equality, health, privacy and human dignity reveals that reproductive rights constitute a complex legal category, whose realisation depends on the simultaneous operation of multiple fundamental rights. Reproductive autonomy emerges precisely from the convergence of these different constitutional guarantees.

The understanding of reproductive rights as an expression of the indivisibility of fundamental rights makes it possible to overcome reductionist views that treat them exclusively as a matter of individual liberty or exclusively as public health policy. It is, in reality, a multifaceted constitutional category that simultaneously involves self-determination, material equality, protection of health and recognition of human dignity.

For this reason, the analysis of reproductive rights leads inevitably to the examination of the normative foundations that confer unity upon these different dimensions. Among these foundations, human dignity and bodily autonomy stand out in particular, which will be analysed below as constitutional bases of reproductive self-determination.

4 HUMAN DIGNITY AND BODILY AUTONOMY AS NORMATIVE FOUNDATIONS OF REPRODUCTIVE SELF-DETERMINATION

The constitutional protection of reproductive self-determination finds its principal normative foundations in human dignity and bodily autonomy. Although reproductive rights are frequently analysed on the basis of specific guarantees relating to health, privacy or family planning, their deeper justification derives from the recognition that each individual possesses intrinsic value and must be treated as a subject capable of autonomously conducting their own existence. In this sense, reproductive self-determination does not constitute a mere projection of individual interests relating to sexuality or motherhood, but a direct expression of human dignity as a structuring principle of contemporary constitutionalism.

The centrality of human dignity within the constitutional system results from the progressive affirmation of the person as the ultimate purpose of the legal order. More than a specific legal principle, dignity acts as the axiological foundation of fundamental rights, guiding constitutional interpretation and establishing limits on the exercise of state power. As Ingo Wolfgang Sarlet observes:

“We understand human dignity to be the intrinsic and distinctive quality recognised in each human being that makes them deserving of the same respect and consideration on the part of the State and the community, entailing, in this sense, a complex of fundamental rights and duties that protect the person both against any and all acts of a degrading and inhuman nature and that guarantee them the minimum existential conditions for a healthy life, in addition to enabling and promoting their active and co-responsible participation in the destinies of their own existence and of life in communion with other human beings.”⁵

The formulation proposed by Sarlet reveals that dignity is not limited to protection against degrading treatment or the guarantee of minimum conditions of survival. Its contemporary dimension equally encompasses the protection of individual autonomy and the capacity of each person to participate actively in the construction of their own existential trajectory. Choices relating to sexuality, motherhood, the constitution of the family and reproduction are inserted precisely within this set of fundamental decisions that give meaning to the free development of the personality.

From this perspective, reproduction ceases to be understood exclusively as a biological phenomenon or as a matter of family interest and assumes a dimension directly related to human dignity. The imposition of reproductive decisions by third parties — whether the State, religious institutions, health professionals or members of the family itself — represents a potential violation of individual autonomy, insofar as it transfers to external agents choices that belong to the most intimate core of the personality.

The connection between human dignity and reproductive self-determination also finds relevant development in contemporary feminist doctrine. Laura Ronchetti holds that women's autonomy must be understood as a constitutionally protected sphere of sexual and reproductive self-determination, indispensable for the realisation of substantive equality. According to the author:

“Only a legal perspective based on the personal autonomy of women — understood as a sphere of sexual and reproductive self-determination constitutionally guaranteed and intimately linked to the objective of self-realisation — can ensure the equal social dignity of all persons in our legal order, regardless of sex or gender.”⁶

The reflection developed by Ronchetti makes it possible to understand that reproductive self-determination does not constitute a mere manifestation of negative liberty. It is a legal position whose protection is indispensable for women to be recognised as full subjects of rights, capable of autonomously formulating and realising their life projects. Reproductive autonomy ceases to be perceived merely as an individual faculty and assumes

⁵ SARLET, Ingo Wolfgang. *Human dignity and fundamental rights in the Federal Constitution of 1988*. 13th ed. Porto Alegre: Livraria do Advogado, 2022, p. 73.

⁶ RONCHETTI, Laura. *L'autodeterminazione riproduttiva delle donne*. Napoli: Editoriale Scientifica, 2018, p. 112.

a structural dimension related to gender equality and to the very realisation of the democratic ideal.

The understanding of human dignity as a foundation of reproductive autonomy also finds important support in the capabilities theory developed by Martha C. Nussbaum. Departing from purely formal conceptions of liberty, the author holds that dignity requires the guarantee of real opportunities so that individuals may exercise fundamental choices relating to their own existence.

Among the central capabilities necessary for human flourishing, Nussbaum expressly includes bodily integrity, defined in the following terms:

“Bodily integrity. Being able to move freely from place to place; having one's bodily boundaries treated as sovereign, i.e. being able to be secure against assault, including sexual assault, child sexual abuse, and domestic violence; having opportunities for sexual satisfaction and for choice in matters of reproduction.”⁷

The relevance of this formulation for the constitutional protection of reproductive self-determination is evident. The capacity to make choices relating to reproduction does not appear as a secondary interest or a mere individual preference. On the contrary, it forms part of the set of conditions indispensable for a dignified life and for the full development of human potential.

The capabilities theory makes it possible to overcome excessively individualistic interpretations of reproductive liberty. For Nussbaum, it is not enough to formally ensure the right to choose. It is necessary to guarantee the material conditions that make that choice effectively possible. Liberty is only realised when accompanied by the means necessary for its realisation.

The author emphasises this relationship when she affirms that:

“The emphasis on capabilities as social goals is closely linked to an emphasis on human equality, in the sense that discrimination on the basis of race, religion, sex, nationality, caste, or ethnicity is taken to be, in itself, a failure in the capability of affiliation, a type of indignity or humiliation.”⁸

This understanding is of special relevance for reproductive rights. Historical experience demonstrates that women face not only formal legal restrictions on reproductive autonomy. Economic, cultural and institutional obstacles frequently limit their concrete capacity to exercise control over their own bodies. The constitutional protection of

⁷ NUSSBAUM, Martha C. *Women and Human Development: The Capabilities Approach*. Cambridge: Cambridge University Press, 2000, p. 78.

⁸ NUSSBAUM, Martha C. *Women and Human Development: The Capabilities Approach*. Cambridge: Cambridge University Press, 2000, p. 82.

reproductive self-determination therefore requires not only the elimination of arbitrary interventions, but also the adoption of measures capable of removing structural barriers that prevent the effective exercise of liberty.

At this point, the contribution of Juliana Cesario Alvim Gomes proves particularly relevant. In developing an integrated approach between liberty and equality for the protection of sexual rights, the author warns that autonomy cannot be conceived as an abstract attribute, exercised independently of the concrete conditions in which individuals live. In her words:

“Liberty read in the light of equality would require equal conditions for the exercise of the freedom to invent and choose the way of living one’s own life, avoiding the abuse of economic power and the idealisation of the individual decision as being completely autonomous.”⁹

The formulation proposed by Gomes makes clear that bodily autonomy cannot be reduced to the simple absence of state coercion. Decisions relating to sexuality, motherhood and reproduction are frequently influenced by economic, social and cultural factors that concretely condition the possibilities of choice available to women.

Bodily autonomy thus assumes a dual dimension. In a negative sense, it protects against undue interference over the body and the reproductive capacity. In a positive sense, it requires the creation of conditions capable of ensuring the effective exercise of reproductive liberty. This dual function proves particularly important when one considers that the female body has historically constituted a privileged object of legal, political and moral control.

Over the centuries, legal norms, religious discourses and institutional practices were used to regulate female sexuality and determine socially acceptable standards of motherhood. Reproduction was frequently presented as the natural destiny of the female condition, converting reproductive capacity into an instrument for legitimising structures of inequality and dependence. The constitutional protection of bodily autonomy represents, in this context, an important mechanism for overcoming these historical forms of subordination.

The connection between human dignity, bodily autonomy and reproductive self-determination makes it possible to understand that decisions relating to reproduction form part of the most protected core of the personality. The choice whether or not to have children, to define the timing of motherhood, to use contraceptive methods or to resort to assisted reproduction techniques involves central aspects of the identity, liberty and existential projects of individuals. For this reason, intervention over the reproductive sphere does not affect only private interests, but has direct repercussions on the capacity for self-determination that the Constitution seeks to ensure for all persons.

⁹ GOMES, Juliana Cesario Alvim. *Sexual rights and their legal foundation*. Rio de Janeiro: Lumen Juris, 2022, p. 214.

Reproductive self-determination thus emerges as a concrete projection of human dignity and bodily autonomy. Its recognition ensures women the condition of subjects capable of formulating and realising their own life projects, rejecting conceptions that subordinate their choices to collective, moral or institutional interests defined by third parties. The protection of reproductive autonomy is therefore not limited to the guarantee of individual liberty, but forms part of the very constitutional commitment to substantive equality, democratic citizenship and the full development of the personality.

5 REPRODUCTIVE SELF-DETERMINATION AS AN IMPLICIT FUNDAMENTAL RIGHT

The constitutional protection of reproductive self-determination does not depend on the existence of an express provision in the constitutional text. Contemporary constitutionalism has consolidated the understanding that fundamental rights are not exhausted in the catalogue formally provided for by constitutions, admitting the recognition of materially fundamental rights extracted from the principles, values and guarantees that structure the constitutional order. The Constitution comes to be understood not as a closed system of previously enumerated rights, but as an open order of protection of the human person, capable of encompassing new demands arising from social, political and cultural transformations.

This understanding assumes special relevance in the field of reproductive rights. Although the Constitution of the Republic of 1988 does not expressly mention reproductive self-determination, several of its provisions offer normative support for the recognition of a constitutionally protected sphere of autonomy relating to reproduction. Human dignity, liberty, equality, privacy, health and family planning constitute foundations that, interpreted systematically, make it possible to identify the existence of a fundamental right aimed at the protection of individuals' reproductive choices.

The debate concerning reproductive self-determination as an implicit fundamental right is therefore part of a broader discussion on the material openness of the catalogue of fundamental rights and on the capacity of the Constitution to respond to new forms of vulnerability and exclusion. It is a matter of investigating whether the protection of reproduction can be understood as a necessary consequence of the constitutional principles that ensure liberty, equality and human dignity, even in the absence of a specific textual provision.

The possibility of recognising fundamental rights not expressly provided for in the constitutional text finds its foundation in the very normative structure of the Constitution of 1988. Alongside the formal catalogue of fundamental rights and guarantees, the Brazilian

constituent adopted a clause of material openness intended to allow the incorporation of new rights arising from constitutional principles and international human rights treaties. In this context, Article 5, § 2, of the Constitution establishes that the rights and guarantees expressed in the constitutional text do not exclude others arising from the regime and principles adopted by it or from the international treaties to which the Federative Republic of Brazil is a party.

Brazilian constitutional doctrine widely recognises that this provision enshrines an open system of fundamental rights. As Ingo Wolfgang Sarlet observes, the Constitution of 1988 admits the existence of materially fundamental rights that, although not expressly provided for in its catalogue, derive directly from the values and structuring principles of the constitutional order. The fundamentality of a given right does not depend exclusively on its topographical location in the constitutional text, but also on its content and its close connection to the protection of human dignity and to the free development of the personality.¹⁰

The material openness of the constitutional catalogue proves particularly important in the face of the social transformations that characterise contemporary democracies. The evolution of social relations frequently produces legal situations that were not expressly contemplated by the original constituent, but which require constitutional protection by reason of their connection with the fundamental values of the democratic order. Constitutional interpretation comes to play, in this context, a decisive role in the identification and protection of legal positions indispensable to the realisation of liberty, equality and human dignity.

The identification of an implicit fundamental right requires the demonstration of its connection to the structuring principles of the Constitution. It is not a matter of recognising new rights in an arbitrary manner, but of verifying whether a given legal position constitutes a necessary projection of the values that shape the Democratic State governed by the rule of law. From this perspective, reproductive self-determination presents an unequivocally materially fundamental nature.

Decisions relating to reproduction directly affect individuals' capacity to formulate and realise their own life projects, influencing existential choices relating to sexuality, the constitution of the family, motherhood, fatherhood and the development of the personality. It is a decision-making sphere that bears upon central aspects of the human condition and which, for this reason, cannot remain outside constitutional protection.

The connection between reproductive self-determination and human dignity derives from the recognition that each person must be treated as a moral subject capable of making

¹⁰ SARLET, Ingo Wolfgang. *The effectiveness of fundamental rights*. 14th ed. Porto Alegre: Livraria do Advogado, 2022, p. 88-91.

fundamental choices about their own existence. The imposition of reproductive decisions by the State or by third parties directly compromises this condition of autonomy, transforming individuals into instruments of purposes that are external to them. The protection of reproductive self-determination therefore constitutes a requirement inherent in the principle of human dignity, insofar as it ensures individuals control over an essential dimension of their identity and their existential projects.

The understanding of reproduction as a protected sphere of individual autonomy finds important support in the constitutional theory developed by Ronald Dworkin. In reflecting on decisions relating to birth, family and reproduction, the author holds that certain choices belong to the core of individual moral responsibility and must be reserved primarily to the individuals themselves. According to Dworkin, existential decisions relating to the way in which each person intends to conduct their own life constitute manifestations of the ethical liberty indispensable to human dignity.¹¹

Dworkin's contribution proves especially relevant to the theme of reproductive self-determination because it makes it possible to understand that decisions relating to motherhood and reproduction do not involve only personal preferences. They concern the definition of fundamental values, the construction of individual identity and the formulation of existential projects that cannot legitimately be substituted by the will of the State or by majority moral conceptions. Reproduction thus forms part of the set of choices that belong to the domain of constitutionally protected individual autonomy.

However, reproductive self-determination does not derive exclusively from individual liberty. Its constitutional protection equally requires consideration of the concrete conditions under which choices are made. In this sense, Juliana Cesario Alvim Gomes holds that the effectiveness of sexual and reproductive rights depends on the articulation between liberty and equality, rejecting conceptions that privilege only one of these dimensions.¹²

Liberty ensures the space of individual decision; equality provides the conditions necessary for that decision to be exercised in an autonomous, informed and meaningful way. Reproductive self-determination therefore presents itself as a legal position whose fundamentality results precisely from the interaction between these two constitutional categories. The protection of reproduction is not limited to the prohibition of arbitrary interference, but equally requires the adoption of measures intended to remove structural obstacles that hinder the exercise of autonomy.

¹¹ DWORKIN, Ronald. *Life's Dominion: An Argument About Abortion, Euthanasia, and Individual Freedom*. New York: Vintage Books, 1994, p. 154-167.

¹² GOMES, Juliana Cesario Alvim. *Sexual rights and their legal foundation*. Rio de Janeiro: Lumen Juris, 2022, p. 213-215.

The connection between reproductive self-determination, liberty and equality finds important support in the Brazilian constitutional text itself. In regulating rights relating to the family and reproduction, the Constitution of 1988 enshrined family planning as a fundamental right linked to human dignity and responsible parenthood. Article 226, § 7, establishes that:

“Founded on the principles of human dignity and responsible parenthood, family planning is the free decision of the couple, it being incumbent upon the State to provide educational and scientific resources for the exercise of this right, any coercive form on the part of official or private institutions being prohibited.”¹³

The constitutional provision of family planning is of special relevance for the construction of reproductive self-determination as an implicit fundamental right. Although the provision does not expressly employ this terminology, it recognises the existence of a sphere of decision relating to reproduction protected against coercive interference and directly linked to human dignity.

More than that, the constituent did not limit itself to ensuring negative liberty in the face of possible state interventions. It equally attributed to the State the duty to provide educational and scientific resources capable of enabling the effective exercise of this right. The constitutional norm therefore makes clear the simultaneous presence of the negative and positive dimensions of reproductive autonomy, reinforcing the understanding that reproduction forms part of the set of constitutionally protected liberties.

The constitutional reference to free reproductive decision demonstrates that the Constitution does not conceive of reproduction as a matter subject exclusively to state determination or to the imposition of uniform moral standards. On the contrary, it attributes to individuals a space of autonomy to define fundamental aspects of their family and reproductive life, recognising that such choices form part of the scope of constitutional liberties.

From this perspective, family planning may be understood as one of the most relevant normative manifestations of reproductive self-determination in the Constitution of 1988. From the articulation between human dignity, liberty, equality, health, privacy and family planning, it becomes possible to identify the existence of a fundamental legal position aimed at the protection of individuals' reproductive choices.

Reproductive self-determination does not, therefore, arise as a right artificially created by constitutional interpretation. On the contrary, it presents itself as a logical and systematic consequence of the principles and guarantees that structure the Brazilian constitutional order. Its protection derives from the need to ensure that each person can exercise control over

¹³ BRAZIL. Constitution of the Federative Republic of Brazil of 1988. Art. 226, § 7.

fundamental aspects of their own existence, formulating life projects compatible with their convictions, values and aspirations.

In this way, reproductive self-determination must be recognised as an implicit fundamental right within the Brazilian constitutional order. Its material fundamentality derives from its intimate connection to human dignity, individual liberty, substantive equality, privacy, health and family planning. In a constitutional order founded on the centrality of the human person, the protection of the capacity to decide on one's own reproduction constitutes a requirement inherent in the democratic commitment to liberty, equality and justice.

6 FINAL CONSIDERATIONS

The constitutionalisation of matters relating to reproduction constitutes one of the most relevant transformations of contemporary constitutionalism. Over the last decades, themes historically relegated to the private sphere have come to be progressively incorporated into constitutional debate, revealing that decisions relating to sexuality, motherhood, family planning and reproductive capacity have a profound connection with the realisation of fundamental rights and with the very realisation of democratic citizenship.

The course developed in this study made it possible to demonstrate that reproduction cannot be understood exclusively as a biological phenomenon, a private experience or a matter of individual morality. Reproductive choices directly influence the educational, professional, economic and political opportunities of people, especially of women, assuming their own constitutional relevance. For this reason, reproductive autonomy must be analysed as a matter of constitutional justice, directly linked to the distribution of resources, opportunities and capabilities indispensable to the exercise of liberty and equality.

The internationalisation of human rights played a decisive role in this process. The Convention on the Elimination of All Forms of Discrimination against Women, the International Conference on Population and Development held in Cairo and the Beijing Platform for Action contributed to consolidating the understanding that reproductive rights form part of the universal legal heritage of human rights. The freedom to decide whether, when and under what circumstances to have children came to be recognised as an indispensable element for the realisation of human dignity, gender equality and democratic participation.

The analysis of reproductive rights from the perspective of fundamental rights made clear their necessarily multidimensional character. The protection of reproductive autonomy does not derive from a single isolated constitutional guarantee, but from the convergence between liberty, equality, privacy, health, bodily integrity and human dignity. Reproductive rights constitute a paradigmatic expression of the indivisibility and interdependence of

fundamental rights, requiring simultaneously protection against arbitrary interference and access to the material conditions necessary for the effective exercise of autonomy.

In this context, human dignity and bodily autonomy prove to be the principal normative foundations of reproductive self-determination. The constitutional protection of reproduction is not limited to the formal guarantee of freedom of choice, but presupposes the recognition that each individual possesses intrinsic value and moral capacity to autonomously conduct their own existence. Decisions relating to sexuality, motherhood and the constitution of the family form part of the most protected core of the human personality, which is why they cannot legitimately be subordinated to external interests defined by third parties.

The research also demonstrated that reproductive self-determination can be recognised as an implicit fundamental right within the Brazilian constitutional order. Although the Constitution of the Republic of 1988 does not expressly employ this terminology, the systematic interpretation of its principles and guarantees makes it possible to identify a constitutionally protected sphere of autonomy relating to reproduction. Human dignity, liberty, equality, privacy, health and family planning constitute normative foundations sufficient to sustain the existence of a fundamental legal position aimed at the protection of individuals' reproductive choices.

The clause of material openness provided for in Article 5, § 2, of the Constitution reinforces this conclusion by admitting the recognition of materially fundamental rights not expressly provided for in its formal catalogue. Reproductive self-determination presents an unequivocal material fundamentality, insofar as it protects existential choices directly related to the free development of the personality and to the realisation of human dignity.

It is concluded, therefore, that reproductive self-determination constitutes an implicit fundamental right within Brazilian constitutionalism, whose protection derives from the very axiological logic of the Constitution of 1988. The recognition of this legal position does not represent an artificial creation of constitutional interpretation, but a necessary consequence of the democratic commitment to liberty, substantive equality and human dignity. In pluralist societies committed to the protection of fundamental rights, ensuring people control over their own reproductive decisions constitutes an indispensable condition for the full realisation of citizenship and for the realisation of the constitutional project inaugurated by the Constitution of the Republic.

ABSTRACT

Postgraduate programs are subject to periodic evaluations to maintain their standing within Mexico's National Postgraduate System (SNP). This article presents a management methodology for non-classroom postgraduate programs, aimed at strengthening the permanence of the Master's Program in Emerging Information Technologies (MTIE) within the SNP of the Secretariat of Science, Humanities, Technology, and Innovation (SECIHTI). The objective is to guide programs toward favorable evaluations across five required dimensions: (1) academic program capacities; (2) commitment to student development; (3) curriculum relevance; (4) commitment to inclusion and substantive equality; and (5) commitment to society. The study is documentary in nature and organizes graduate program management into structured stages. The result is a replicable guide of good practices for non-classroom postgraduate programs in Mexican higher education institutions (HEIs). The study concludes that governmental regulatory changes do not invalidate the guide but require its continuous updating.

gestão para programas de pós-graduação não tradicionais, bem como uma estratégia para fortalecer a permanência do Programa de Mestrado em Tecnologias Emergentes da Informação (MTIE) no SNP da Secretaria de Ciência, Humanidades, Tecnologia e Inovação (SECIHTI). O objetivo é alcançar uma avaliação satisfatória em cinco dimensões: (1) competências acadêmicas do programa, (2) compromisso com a formação dos alunos, (3) relevância do currículo, (4) compromisso com a inclusão e a igualdade substancial e (5) compromisso com a sociedade. Para tanto, o programa é classificado por etapas ou processos na gestão de um programa de mestrado. Isso resulta em um guia de boas práticas para programas de pós-graduação não tradicionais em Instituições de Ensino Superior (IES) mexicanas, levando à conclusão de que as mudanças governamentais não alteram esse guia; pelo contrário, o aprimoram.

RESUMEN

Los programas de posgrado están sujetos a evaluación para su permanencia en el Sistema Nacional de Posgrados (SNP). Este artículo presenta una metodología de gestión para programas de posgrados no escolarizados, así como para fortalecer la permanencia del programa de maestría en Tecnologías de Información Emergentes (MTIE) en el Sistema Nacional de Posgrados de la Secretaría de Ciencia, Humanidad, Tecnología e Innovación (SECIHTI). Teniendo como finalidad la valoración aceptable en las cinco dimensiones: (1) capacidades académicas de programa, (2) compromiso con la formación de las y los estudiantes, (3) pertinencia del programa de estudios, (4) compromiso con la inclusión y la igualdad sustantiva, y (5) compromiso con la sociedad. Para ello se procede a clasificar por etapas o procesos en la gestión de un programa de maestría. De esta manera, da como resultado una guía de buenas prácticas para posgrados no escolarizados en Instituciones de Educación Superior (IES) mexicanas, lo que permite concluir que los cambios gubernamentales no alteran dicha guía sino al contrario.

Palabras clave: Educación. Posgrado. Virtual. Buenas Práticas. Políticas Públicas.

1 INTRODUCTION

Since the publication of the Guidelines of the National Postgraduate System of the Secretariat of Science, Humanities, Technology, and Innovation (SECIHTI) in the Official Gazette of the Federation on 21 October 2025 (SECIHTI, 2025), the postgraduate programs of universities, higher education institutions (HEIs), and research centres in Mexico have sought recognition of their programs in order to obtain scholarships and complementary support for people undertaking postgraduate studies at an HEI.

For more than a decade, Mexican universities have faced a significant challenge in integrating their postgraduate programs into the National Postgraduate Quality Program (PNPC), which is being replaced by the National Postgraduate System (SNP). Studies by Becerra Romero (2017) demonstrate the low accreditation rate of postgraduate programs in the state of Nayarit. Similarly, another study by Cajigal-Molina and Hernández-Marín (2020) on the current situation of postgraduate programs in the state of Campeche confirms this reality, noting that only two higher education institutions (HEIs) received quality accreditation for their programs.

However, the Statistical Yearbook of Higher Education – Postgraduate (ANUIES, 2025) for the 2024-2025 academic year, adding to the research the variables of student population (enrolled, new entrants, and graduates), federal entity, type of institution (state public universities, federal public universities, and technological universities), level of study (master's degree), and mode of study (non-classroom), reflects the reality of students enrolled in non-classroom postgraduate programs at the master's level. It is possible to highlight, in the Southeast of Mexico, an average of 15 students in the states of Campeche, Chiapas, and Tabasco, compared with an average of 43 students in the states of the central region of the country (State of Mexico, Puebla, and Morelos).

It is worth noting that both studies conclude that higher education institutions (HEIs) play an important role in high-level professional training due to the diversity of their postgraduate programs, with a differentiating factor being the increase in the percentage of programs accredited in the National Postgraduate System (SNP), as well as the creation of spaces for research and postgraduate programs oriented towards social commitment, research for solving priority problems, and improvement of academic consolidation indicators.

Considering that, in order to obtain recognition of postgraduate programs within the framework of the National Postgraduate System (SNP), the minimum conditions of a postgraduate program must be ensured across five dimensions: (1) academic capacities of the program, (2) commitment to student development, (3) relevance of the program of study, (4) commitment to inclusion and substantive equality, and (5) commitment to society

(SECIHTI, 2025). Therefore, at present, a total of 2,535 postgraduate programs, including specialisations, master's degrees, and doctorates, are accredited in the SNP throughout the country (SECIHTI, 2025).

Postgraduate programs in Mexico are classified into two categories: specialised programs, oriented towards industry, and those accredited by SECIHTI (Secretariat of Science, Technology, and Innovation), which focus on research and technological development (professional programs). Two modes of teaching are also recognised: classroom-based and distance learning (hybrid or blended teaching) (DOF, 2025). In this context, the Master's Program in Emerging Information Technologies (MTIE), since its creation, has adhered to the parameters established by the National Postgraduate Quality Program (PNPC) since 2019. However, due to governmental changes and the continuous improvement of the program's mechanisms, the MTIE was re-accredited by the SNP (National System of Postgraduate Programs) in the 2025 call (SECIHTI, 2025).

Along these same lines, public universities, by offering more postgraduate programs within the framework of the National System of Researchers (SNP), guarantee social recognition and access to national scholarships for the students of these programs, even in the face of the challenges of achieving financial balance in the operation of a postgraduate program at a higher education institution (HEI).

Given the characteristics inherent to postgraduate programs, these arise from the needs of the region, of disciplinary groups or academic bodies, and of researchers of the National System of Researchers (SNII), and form an Academic Core (NAB) that will support the postgraduate program in question. Nevertheless, management and organisation mechanisms are essential for the operation of a postgraduate program in order to obtain accreditation within the framework of the SNP.

Therefore, this article presents a guide of good practices to maintain the operational efficiency and continuous improvement of a postgraduate program, as well as its permanence in the SNP in Mexico.

2 THEORETICAL BACKGROUND

At the national level, Villalobos-López (2024) presents a “historical overview of postgraduate studies in Mexico and online doctorates”, from 2010 to 2022, highlighting that in the last academic year of 2021-2022, 183,868 postgraduate students enrolled in non-classroom programs, of whom 13% enrolled in public higher education institutions and the remainder in private higher education institutions; demonstrating that private higher education

institutions were not accredited in the national postgraduate quality program, although he justifies that private higher education institutions are the most prestigious in the country.

Although there are other studies, such as that of Esquivel-Becerril, Reyes-García, and Reyes García (2018), which presents “postgraduate studies and the current situation in Mexico”, highlighting national scholarships as the main means of access to quality postgraduate programs, García-García (2009) emphasises the importance of analysing institutional dynamics, allowing the recognition of academic, administrative, and organisational capacities to achieve better quality indicators. Similarly, Reyes-Mojarras (2006) presents the challenges faced by postgraduate programs in Mexico in the field of Law, offering some considerations that address the current state of postgraduate studies in Mexico.

Another work worth mentioning is that of Álvarez Mendiola and Carrillo Valdez (2025), which presents “Postgraduate studies in Mexico: Recent trends in their expansion and diversification”. It demonstrates significant growth in postgraduate programs at private higher education institutions (HEIs) compared with public HEIs, classifying non-classroom postgraduate programs, and mentions the lack of clear guidelines or procedures to strengthen postgraduate accreditation criteria.

At the international level, there are also studies on the factors that assess academic quality in postgraduate programs, as mentioned by Soto-Grant and Castro-Garro (2024). They highlight that the quality of a postgraduate program is not limited to what happens within classrooms or laboratories, but depends on two macro-processes of external management: proactive engagement with the community/industry and systematic monitoring of the impact of graduates. They conclude that specific administrative indicators should be developed to measure integration into the labour market and the social contribution of graduates, adapting to local, regional, and national economic realities, rather than blindly replicating accreditation models from developed countries.

Along these same lines, Valdés-Montecinos, Correa-Castillo, Briceño-Toledo y Suárez-Amaya, (2021) present a study on self-assessment models and best practices in non-classroom postgraduate programs, demonstrating that administrative management in virtual environments requires a transformation of staff to become mediators of learning and facilitators of digital procedures, highlighting as a key practice the articulation of learning management systems with academic and financial control systems, allowing postgraduate students to manage their activities, thesis supervision, and payments autonomously and asynchronously, in order to increase student satisfaction and the efficiency of academic

management processes, with the intention of accrediting their management processes nationally or internationally through the ISO 9001:2015 standard.

Finally, the organisational structure and comprehensive management guidelines for postgraduate programs are part of the administrative formality of a program, since they not only establish internal rules but also ensure that the program meets the standards of quality and transparency before accreditation bodies. A practical example of multi-campus governance is Universidad Santo Tomás (2019), which presents a detailed guide for essential administrative processes, such as the control and registration of academic records, the formal appointment of thesis supervisors and examiners through standardised committee minutes, and the mandatory alignment of curricula with current institutional research lines, among others. This aims to mitigate administrative informality and ensure the traceability of documents before any governmental entity.

3 METHODOLOGY

This study is documentary and descriptive in nature. It is based on the systematic review and analysis of the SNP Guidelines (DOF, 2025), institutional regulations, SECIHTI evaluation criteria, and relevant academic literature, with the aim of constructing a guide of good practices focused on the five evaluation dimensions established for permanence in the National Postgraduate System (SNP). The study prioritises the analysis of the management process over the measurement of isolated results (Abero *et al.*, 2015; Trujillo *et al.*, 2019).

The study is organised into two phases. Phase 1, called context, describes the structure and management processes of a non-classroom postgraduate program through five sequential stages. Phase 2, called evaluation, operationalises the five dimensions of the National Postgraduate Program (PNPG), translating each into evaluable criteria, suggested indicators, required evidence, and improvement actions. For this purpose, the PNPG Guidelines (DOF, 2025), institutional documents of the MTIE program, and specialised academic literature were analysed, and evaluation tables were constructed for each dimension. The correspondence between Phase 1 and the PNPG dimensions is as follows: Stage 1 (viability and academic core) supports Dimension 1 (academic capacities); Stage 2 (curriculum) supports Dimension 3 (relevance); Stage 3 (community engagement) supports Dimension 5 (commitment to society); and Stage 4 (tutoring and thesis supervision) supports Dimension 2 (student development). Stage 5 (infrastructure) complements the criteria of Dimension 1. Dimension 4 (inclusion and substantive equality) is addressed transversally as an institutional condition that permeates all stages of the management process.

Phase 1 (context) comprises five sequential stages for the operation of a non-classroom postgraduate program: (1) Viability study and formation of the academic core; (2) Curriculum and teaching-learning process; (3) Engagement with sectors of society; (4) Monitoring of academic progress, mentoring, and thesis supervision; (5) Infrastructure and institutional commitment. Each stage provides documentary data and evidence that support the evaluation of the corresponding dimensions of the National Postgraduate System (SNP) in Phase 2.

In the first stage, starting from the assumption that a viability study exists, the next strategy is to form a group of teacher-researchers to create an academic core (NAB). Therefore, the master's program in emerging information technologies was developed by members of two academic cores (CA): the Computer Science Group (CC) and the Information and Communication Technologies for Teaching and Learning Group (TICEA). Both groups are composed of teacher-researchers, and some members belong to the National System of Researchers (SNII). However, each group cultivates Lines of Research and Social Impact (LPIS) that guide their academic production and differentiate their disciplinary approach.

For the CC group, the LPIS encompass human-computer interaction and distributed networks and systems; for the TICEA group, the LPIS focus on information technologies, communications, and collaboration for learning. Considering the above and based on the needs of the region and the continuity of the undergraduate teaching programs of the HEI, the master's program arises, aiming, simultaneously, to consolidate the commitment of the program's collaborators, that is, to form the Academic Core of the postgraduate program.

Stage 2 focuses on the curriculum and its relevance; that is, the rationale of the postgraduate program is vital for the development of the teaching-learning process, considering the institutional guidelines and the code of good practices of the National Postgraduate Quality Program (PNPC) (CONACYT, 2018). The General Directorate of Research and Postgraduate Studies (DGIP) is responsible, as an internal institutional entity, for ensuring the quality of postgraduate programs.

The rationale of the program encompasses four key elements: (a) admission requirements, including a standardised selection process using the CENEVAL EXANI-III (2024); (b) curriculum and duration (four semesters for the master's degree, six for the doctorate), with elective subjects that reinforce the final project and strengthen internationalisation; (c) course completion requirements, which include the publication of at least one article in high-impact indexes (Scopus, Web of Science) and outreach activities; and (d) monitoring of academic progress and tutoring, which is developed in Stage 4. The details

of the indicators, evidence, and improvement actions for each of these elements are presented in Dimension 3 (program relevance) of the Results section.

In the third stage, engagement with sectors of society essentially involves collaboration with the target sector of the postgraduate program, obviously through complementary activities, such as mentoring, projects, fieldwork, and academic collaboration with students in seminars, workshops, colloquia, discussions, or complementary activities with other similar postgraduate programs. Evidence of this engagement includes collaboration agreements, letters of intent, socially recognised projects, and joint activities among the program, the Academic Groups, and the priority sectors of the region.

In stage 4, concerning the monitoring of academic progress, tutoring, and thesis supervision, it is essential that a non-classroom program has a tutoring model. This means that monthly academic tutoring must be a priority, with each student assigned to a tutor from the moment they enter the postgraduate program. This personalised support will help improve academic performance and prevent students from dropping out of the course or falling behind. This tutoring model must include verifiable instruments that document the monthly tutoring sessions and value synchronous communication, whether virtual or in person, which must take place at least once a month. Regarding thesis supervision, it is important to clarify the number of students per supervisor and to ensure their validation by the academic body. It is worth noting that the academic tutor has a different function from that of the thesis supervisor.

Finally, stage 5, concerning infrastructure and institutional commitment, relates to guaranteeing the availability, 24 hours a day, 7 days a week, of the institutional educational platform, as well as compliance with technical responsibilities and the consolidation of improvements in the technological infrastructure. It also includes maintaining access to digital libraries and inter-institutional agreements for access to bibliographic resources. In this sense, institutional commitment is necessary to ensure that academic management and administrative processes are fully digital, as well as the constant updating of the learning platform to strengthen students' learning processes, such as videoconferences, virtual forums, among others.

4 RESULTS AND DISCUSSION

Based on the documentary analysis carried out in Phase 2, the assessment tables for each of the five dimensions of the SNP (DOF, 2025) are presented. For each dimension, evaluable criteria were identified, compliance indicators and verifiable documentary evidence were proposed, and improvement actions were formulated to strengthen the program's

continuous participation in the SNP. The results are organised according to the methodological structure described in Phase 1, showing how each management process of the program contributes to meeting the required quality standards.

Dimension 1. The academic capacities of the program are based on three criteria: (a) The Academic Core (NA) must meet the minimum number of members registered in the National System of Researchers (SNII). (b) The profile of the NA members. (c) The infrastructure capacities.

Therefore, for each criterion, supporting documentation is considered for the following suggested indicators, defined for evaluation by SECIHTI (2025), as well as the necessary evidence and improvement actions. In this sense, it is important to provide evidence for each criterion, whether on the master's program website or in downloadable documents shared on a server.

Table 1

Criteria of Dimension 1

Criteria	Suggested indicators	Required evidence	Improvement actions
Members of the academic core (NA).	Updated curriculum vitae, relation to the course taught, recent publications, participation in Research and Social Impact Lines (LIES), national/regional projects, and SNII recognition	Institutional document of the members of the Academic Group or of the core faculty. Letter of commitment from each member of the Academic Group to the program and the teaching-course relationship. Link to the complete curriculum vitae.	Keep curricula updated and strengthen ties with national/regional projects.
Profile of the NA members.	Teaching/research reports, current publications, outreach activities.	Evidence of the profile of the academic core faculty members, including outreach activities.	Encourage joint publications and expand outreach activities.
Infrastructure capabilities.	Inventory of equipment/software, academic platforms, and proof of use.	Technical and photographic proof of the platform used (hardware and software	Equipment maintenance and support, and certification of instructors in course delivery and platform use.

Source: prepared by the authors.

In this dimension, it is relevant to highlight the need for at least eight members in the National System of Research and Innovation (SNII), in accordance with the Guidelines published in the Official Gazette of the Federation (DOF) (2025) for criterion (a). It is essential that academic profiles are aligned with the objectives of each postgraduate program; however, ensuring that each faculty, school, or department integrates all the required professional profiles is practically impossible. Nevertheless, inter-departmental collaboration

can mitigate this type of difficulty. Cajigal-Molina and Hernández-Marín (2020) demonstrate that higher education institutions in the southeast face greater challenges than those in the central region of the country.

Dimension 2. The commitment to student development focuses on (a) graduation rates and academic delays among students enrolled in the program, as well as (b) student support and guidance (student/teacher ratio). It is emphasised that each student selects their supervisor based on their professional profile to promote empathy and alignment with their project. However, it is important to distinguish between academic guidance and disciplinary guidance. To this end, a thesis committee is established to balance the supervision and co-supervision of the thesis, guaranteeing the quality of the outcomes of the research projects.

Table 2

Criteria of Dimension 2

Criteria	Suggested indicators	Required evidence	Improvement actions
Graduation efficiency.	Graduation rate and delay per cohort.	Records of course completion examinations	Encouraging thesis committees to improve the advisor-student relationship.
Student support and guidance.	Formative tutoring model.	Monthly tutoring report with photographic evidence.	Strengthening of the tutoring model for each student with a tutor from the Teaching Assistants team from admission to the program.

Source: prepared by the authors.

Table 2 presents the criteria considered relevant for the evaluation of postgraduate programs within the framework of the National Postgraduate System (SNP), aligned with the stages of admission, permanence, completion, and awarding of degree. An average completion rate of 70% is established as a reference, considered an indicator of adequate efficiency in obtaining the degree. This parameter represents an institutional challenge, since it requires higher education institutions (HEIs) to commit to the implementation and consolidation of their respective Institutional Tutoring Programs (PITs). As Quezada-López (2017) points out, tutoring is a fundamental means of support for the prevention of low academic performance and school dropout, in addition to promoting increased completion rates. In this sense, tutoring is configured as a strategy that enables closer monitoring and effective communication with students.

Dimension 3. The relevance of the program of study is based on (a) congruence between the admission profile, the selection process, and the curriculum, as well as on (b) actions to strengthen the professional development of graduates and (c) actions to mitigate dropout rates.

Table 3 demonstrates that criterion (a) is evidenced by the application of the EXANI-III for postgraduate admission, with the aim of ensuring transparency and equity. This ensures that the selection process does not depend exclusively on internal assessments, reducing biases and guaranteeing equal conditions for all candidates. In addition, the use of the EXANI-III strengthens the administrative formality of the postgraduate program, demonstrating its adherence to national quality standards (Gago-Huguet, 2000) and making its admission processes verifiable and comparable.

Table 3

Criteria of Dimension 3

Criteria	Suggested indicators	Required evidence	Improvement actions
Congruence between the entry profile, a clear and transparent, relevant and equitable selection process, aligned with its objectives.	Mechanism for the selection and interview process. Coherence in advising and field of knowledge with respect to the curriculum and the thesis/dissertation. The graduate program is presented as a differentiating and relevant element compared to other similar programs.	National call for applications under CENEVAL for the EXANI-III examination, admission statistics, and evidence of diversity. Thesis and dissertation matrix document. Dissemination document. Mobility document. Regional/national impact document	Strengthen the internal selection processes in the NA, ensuring clarity and transparency to guarantee equity. Strengthen inclusion initiatives. Align graduate programs with strategic objectives. Disseminate the programs' achievements. Strengthen international mobility. Strengthen accreditations
Actions to strengthen the professional development of graduates.	Mechanism for follow-up and collaboration with alumni, demonstrating professional placement.	Institutional alumni follow-up document. SEAES institutional document. Provide proof of employment.	Strengthen digital mechanisms for alumni follow-up. Expand employment contracts
Actions to mitigate school dropout.	Mechanisms to address and reduce school dropout and improve student retention.	Informational document on national, institutional, and state scholarships. Document on psycho-emotional support services.	Make institutional graduate regulations more flexible to strengthen support programs. Expand institutional support and national scholarships to contribute to student retention.

Source: prepared by the authors.

According to Ramírez Ramírez and Ortega-Guerrero (2018), international mobility fosters the development of social and cultural capital, which can be leveraged in the future in the personal, social, and professional spheres. It also strengthens institutional commitment to postgraduate programs, especially those linked to the National Postgraduate System (SNP). In this sense, promoting student mobility, even for short-term stays, is a fundamental strategy for fostering the professional development of students and driving internationalisation.

One of the actions to demonstrate (b) actions to strengthen the professional development of graduates is the participation of postgraduate programs in the institutional document of the SEAES. The System for the Evaluation and Accreditation of Higher

Education (SEAES) constitutes the national framework that regulates how higher education programs and institutions are evaluated and accredited in Mexico, integrating both internal self-assessment and external accreditation, with the aim of guaranteeing quality, relevance, and continuous improvement. This document includes the monitoring of graduates until they become fit for the labour market within an institutional framework, in addition to presenting well-defined strategies, as pointed out by López Obando and Villamil Bolívar (2019).

Finally, it is necessary to highlight the actions taken to reduce dropout rates, including the dissemination of information about institutional support programs, scholarships and state or national loans, and national scholarships to help students stay in school. The various student support services offered by the Secretariat of Student Affairs or equivalent department of any higher education institution must also be described.

Dimension 4. The commitment to inclusion and substantive equality encompasses institutional actions aimed at guaranteeing equitable conditions of access, permanence, and course completion for all students of the program, regardless of their gender, origin, socioeconomic condition, or vulnerability. This dimension permeates the entire program and requires evidence both in the admission processes and in the organisational culture of the postgraduate program.

Table 4

Criteria of Dimension 4

Criteria	Suggested indicators	Required evidence	Improvement actions
Actions for substantive equality.	Mechanism to identify profiles of students in vulnerable situations and promote equity in access to academic opportunities and reduce dropout rates.	Demonstrate the dropout rate and the mechanisms for resolving academic equality disputes. Protocols for the prevention of and response to gender-based violence and workplace violence.	Scholarship support program; strengthen mentoring programs. Institutional dissemination of protocols on gender-based violence and workplace violence

Source: prepared by the authors.

In this dimension, as demonstrated in Table 4, it is essential to highlight the institutional mechanisms implemented for the prevention of and response to gender-based violence and workplace violence, as well as for the promotion of equality and the resolution of academic conflicts. It is indispensable to recognise that every person – regardless of gender, ethnicity, or condition – who is a victim of violence or discrimination must be treated and protected equitably, guaranteeing the same rights and obligations. This perspective is based on the work of Gutiérrez Bernal and Navarrete Sánchez (2023).

In addition, non-classroom programs face the specific challenge of guaranteeing full digital accessibility: the educational platform, materials, and assessment mechanisms must be accessible to students with visual, auditory, or motor disabilities. This implies not only compliance with the Web Content Accessibility Guidelines (WCAG), but also the existence of institutional protocols for differentiated support. Similarly, it is important to highlight the affirmative action initiatives aimed at groups historically under-represented in postgraduate programs in science and technology, such as women, indigenous students, and people from highly marginalised geographical areas (Soto-Grant and Castro-Garro, 2024).

Dimension 5, Commitment to Society, focuses on linking the program to priority sectors for the development of the region and of Mexico; social responsibility initiatives; and inter-institutional cooperation. In this dimension, it is important to highlight all the outcomes of the postgraduate program, from collaboration agreements with other higher education institutions and inter-institutional projects to the social contributions of postgraduate students.

In this dimension, it is essential to demonstrate explicitly to the National Postgraduate System (SNP) the social outreach activities carried out by the postgraduate programs. As Zarza-Delgado and Herrera-Tapia (2024) mention, these activities must be conceived as an institutional measure aimed at strengthening and developing the social engagement of postgraduate programs. In this sense, it is not enough simply to recognise the activities carried out by students; it is necessary to consolidate the impact of research in addressing the problems of the communities where the programs are located, thus ensuring their tangible impact on society.

Finally, inter-institutional collaboration or cooperation can be demonstrated through partnership agreements between higher education institutions, academic bodies, or research groups. The active participation of Academic Core members in these initiatives — whether through seminars, research meetings, or other joint activities — contributes to strengthening the continuing education of the community of Science, Humanities, Technology, and Innovation (CHTI).

Table 5

Criteria of Dimension 5

Criteria	Suggested indicators	Required evidence	Improvement actions
Link the program to priority sectors for the development of the region and Mexico	The alignment and connection of the program with priority sectors for the development of the region and Mexico. Establishment of ties with relevant social actors for the advising and continuing education of the Science,	Collaboration agreements or letters of intent. Interinstitutional agreements, joint projects, collaborative publications, academic mobility	Diversify projects, strengthen ties with strategic sectors.

	Humanities, Technology, and Innovation (CHTI) community.		
Social responsibility initiatives.	Incorporate social responsibility activities that enable active participation in the benefits of knowledge	Outreach and dissemination activities, community activities, knowledge transfer.	Increase community activities through knowledge transfer, measure social impact.
Interinstitutional cooperation.	Academic links between higher education institutions, with information on academic and research activities coordinated with other institutions.	Interinstitutional agreements, joint projects, collaborative publications, academic mobility	Expansion of collaboration networks, promotion of academic mobility.

Source: prepared by the authors.

5 CONCLUSION

The analysis carried out makes it possible to affirm that the evaluation of non-classroom postgraduate programs in Mexico requires comprehensive management that integrates both the academic capacities and the social relevance of the programs. The guide of good practices presented demonstrates that continuous participation in the National Postgraduate System (SNP) depends not only on compliance with administrative requirements, but also on the consolidation of training, inclusion, and community engagement processes.

In summary, the management proposal presented constitutes a replicable guide for non-classroom postgraduate programs, capable of adapting to regulatory changes and responding to the requirements of quality, relevance, and social impact required by the SNP.

ACKNOWLEDGMENTS

A special thanks to the Secretariat of Science, Humanities, Technology, and Innovation (SECIHTI) and to the Academic Core of the postgraduate program.

ABSTRACT

Given the urgency posed by the climate crisis, the drive towards energy transition and the potential of solar photovoltaic energy, there has been limited adoption of this technology by architects and urban planners, particularly of BIPV (Building-Integrated Photovoltaics) modules, highlighting a disconnect between design practices and available innovations. The aim is to investigate the reasons for the low adoption of photovoltaic technology by professionals in the São Paulo Metropolitan Region, analysing the potential of BIPV and other factors and constraints that may influence this low adoption. To this end, a literature review, documentary research, and a quantitative-qualitative study were conducted, involving an online questionnaire administered to 124 architects and urban planners, as well as interviews with experts. It is noted that a lack of knowledge, particularly regarding BIPV solutions, is the main factor explaining the low adoption rate, followed by the cost of implementation and the negative aesthetic impact of such solutions, which, although relevant, does not influence the choices of architects and urban planners. It is therefore concluded that this research fills a gap in the debate on the role of these professionals in the energy transition, promoting the dissemination and integration of photovoltaic energy in Brazilian architecture.

RESUMEN

Teniendo en cuenta la urgencia que plantea la crisis climática, la búsqueda de la transición energética y el potencial de la energía solar fotovoltaica, se observa una escasa adopción de esta tecnología por parte de arquitectos y urbanistas, especialmente de los módulos BIPV (Building Integrated Photovoltaics), lo que pone de manifiesto un desajuste entre las prácticas de diseño y las innovaciones disponibles. El objetivo es investigar las razones de la escasa adopción de la tecnología fotovoltaica por parte de los profesionales de la Región Metropolitana de São Paulo, analizando el potencial de los BIPV y otros factores y condicionantes que pueden influir en dicha escasa adopción. Para ello, se lleva a cabo una revisión bibliográfica, una investigación documental y un estudio cuantitativo-cualitativo, con la aplicación de un cuestionario en línea a 124 arquitectos y urbanistas, y entrevistas con especialistas. Se observa que la falta de conocimiento, especialmente sobre las soluciones BIPV, es el principal factor que explica la escasa adopción, seguido del costo de implementación y el impacto estético negativo de dichas soluciones, que, a pesar de ser relevante, no influye en la elección de los arquitectos y urbanistas. Se concluye, por lo tanto, que la investigación llena un vacío en el debate sobre el papel de estos profesionales en la transición energética, promoviendo la difusión e integración de la energía fotovoltaica en la arquitectura brasileña.

1 INTRODUCTION

The global climate crisis and the advance of environmental impacts caused mainly by the emission of greenhouse gases (GHG), combined with the growing worldwide demand for electricity, have driven the energy transition towards renewable sources with low environmental impact. In this contemporary scenario, solar photovoltaic energy presents itself as a promising alternative for the development and achievement of more sustainable energy matrices, potentially contributing strategically to the reduction of GHG emissions and to the increase in electricity generation as a replacement for polluting sources, especially fossil fuels, which have a major environmental impact.

Brazil stands out worldwide in relation to the use of renewable energy sources: 50.0% of the national energy matrix and 88.2% of the country's electricity come from renewable sources, compared to worldwide percentages of 14.3% and 29.9%, respectively (MME, 2025). However, hydroelectric generation accounts for 11.6% of the national energy matrix and 56.8% of the country's electricity. Although this energy source is considered renewable, the environmental and socio-economic impacts arising from its installation – such as the flooding and deforestation of vast areas, with loss of biodiversity and the forced displacement of riverside communities and indigenous peoples – as well as the physical limits to its expansion – mainly of a geographical and hydrological nature – demand the search for other available energy sources.

Solar photovoltaic energy, despite contributing only 2.2% of the national energy matrix and 9.3% of the electricity generated, is growing in Brazil. In 2024, the country reached more than 53 GW of installed capacity, compared to 25 GW in 2022, ranking, in absolute terms, sixth among the countries with the largest installed solar power capacity in the world, behind only China, the USA, Japan, Germany and India (MME, 2025; IRENA, 2026). This growth has been driven by technological advancement, which enables the decentralisation of electricity generation, as well as by the gradual reduction in the installation and maintenance costs of photovoltaic systems. Furthermore, between 2012 and 2023, under Normative Resolution REN 482, of 17 April 2012⁴, it can be said that there was a favourable environment for its expansion, with incentives and guarantees from the current legislation, and the establishment of objective rules for the sector (Madeira, 2025).

The expanded use of photovoltaic technology has been occurring in two ways: (i) with the deployment of large power plants, generally in rural areas and associated with centralised systems, using transmission lines so that the energy produced can be conveyed to the points of consumption; and (ii) with the installation of photovoltaic systems in buildings and their

⁴ REN 482 established the general conditions for the access of MMGD to electricity distribution systems, the electricity compensation system (ANEEL, 2012).

surroundings, at the points of consumption themselves, so-called “distributed generation”, also referred to as “distributed micro- and mini-generation” (MMGD).

In MMGD, the installation of photovoltaic systems has been carried out on existing buildings and, more frequently, on roofs and rooftops, where there is greater solar incidence, but such surfaces do not always have sufficient dimensions to meet the entire energy demand of the buildings. In these cases, conventional *Building Applied Photovoltaics* modules, the BAPV, are generally used, which are “added” to the buildings, without there necessarily being any integration with the architecture, that is, without any concern for the aesthetic outcome of the solutions adopted.

In recent years, photovoltaic technology has advanced with innovative solutions in the form of *Building Integrated Photovoltaics*, the BIPV, which are modules that integrate energy-generating systems into the building elements, reconciling energy efficiency and architectural aesthetics (Custódio; Reis, 2023; Koike; Custódio; Rüther, 2023; Zomer; Crestani, 2023). The growth of photovoltaic energy in Brazil could be even greater if architects and urban planners – fundamental and strategic agents in the design and production of the built environment – adopted this technology in their projects.

However, it was observed that photovoltaic energy is still little used by these professionals, even in projects for new buildings: an analysis of the main publications in the field of Architecture and Urbanism in the country⁵ revealed that only 11.7% of the projects and works published in 2023 included photovoltaic systems, most of them with BAPV modules (Madeira, 2025). The evidence of low adoption of photovoltaic technology points to a disconnect between recent design practices, the new solutions available and the potential contribution of architects and urban planners to the expansion of this technology. It is therefore necessary to broaden the debate on the role of these professionals in the energy transition process, highlighting their capacity to influence design decisions and electricity consumption in cities.

Starting from this context, this article aims to present and discuss the main results of doctoral research that sought to investigate the reasons why architects and urban planners do not adopt, or adopt with low frequency, solar photovoltaic power generation systems in market architectural projects, with the São Paulo Metropolitan Region (RMSP) as the territorial scope⁶. As specific objectives, it intends to: (i) identify and analyse BIPV-type photovoltaic

⁵ To assess the use of photovoltaic technology in the recent period, the following were consulted: (i) the AU Magazine, (ii) the platform *Archdaily* and (iii) the *Projeto Magazine* – all responsible for disseminating the most prominent and representative architecture and urbanism projects and works in the Brazilian context.

⁶ This doctoral research was developed in the Graduate Program in Energy of the Universidade Federal do ABC, between 2019 and 2025, under the supervision of Prof. Dr. Federico B. Morante Trigoso and cosupervision of Prof. Dr. Patrícia T. Leite Asano.

systems and their potential for integration with buildings, and (ii) survey and analyse, through quantitative and qualitative research, the level of knowledge and the degree of importance of factors postulated by the researcher, as well as other factors, that could influence the adoption or non-adoption of such systems by architects and urban planners.

The hypothesis formulated related the non-adoption or the low-frequency adoption of photovoltaic technology to three main factors: **lack of knowledge** of the available solutions, especially BIPV; **negative aesthetic impact** and (high) **cost of implementation** of such solutions. It was also considered that the factor **negative aesthetic impact** would be directly related to the **lack of knowledge** of the technology and the available solutions. In other words, architects and urban planners would be failing to specify photovoltaic systems because they are unaware of solutions that can minimise such impacts or even contribute to the improvement of the architectural design.

Considering that there are few studies related to the existing dynamics between the work of professionals in the field of architecture and urbanism and the expansion of photovoltaic technology, this research contributes both to filling this gap and to disseminating, among architects and urban planners, the possibilities of integrating photovoltaic systems into buildings. More broadly, it contributes to promoting the expansion of energy generation from renewable sources.

2 THEORETICAL BACKGROUND

The development of the research had as its starting point the survey, analysis and literature review of two themes that are interrelated and connected to the object of the research: Net Zero Energy Building (*NZEB*) (Koike; Custódio; Rütther, 2023; Good et al., 2016; Scognamiglio; Garde, 2015) and Solar Architecture (Custódio et al., 2020; Custódio; Reis, 2023; Koike; Custódio; Rütther, 2023; Zomer; Crestani, 2023; Custódio; Zomer; Rütther, 2020).

Contemporary literature emphasises the evolution of buildings from mere consumers to producers of energy, consolidating the concept of Net Zero Energy Buildings (NZEB). Such buildings produce their own electricity, locally, in a renewable way, in a quantity sufficient for their annual demand, that is, there is a balance between the amount of energy consumed and the amount of renewable energy produced.

In addition to these buildings, there are also those with nearly zero energy needs, known as nZEB – *nearly-Zero Energy Building*: although they still need to consume electricity from the distribution grid, they already achieve a satisfactory degree of economy as a result of

the renewable energy generated, that is, they are buildings with very high energy performance (Good *et al.*, 2016).

In Europe, zero or nearly zero energy balance is becoming an obligation: through the Energy Performance of Buildings Directives (EPBD) 2010/3 and 2024/1275, the European Union pioneered the establishment of mandatory standards and targets for zero-emission buildings, both for new constructions and for the renovation of buildings. Achieving NZEB or nZEB involves the implementation of strategies aimed at optimising consumption and maximising the production of renewable energy, with emphasis on the installation of solar photovoltaic power generation systems.

However, studies indicate that, in most cases, the energy balance is not achieved solely by using the roof area of buildings for the installation of these systems, which demands the incorporation of façades and other elements of the building envelope for this purpose (Scognamiglio; Garde, 2015). Such a finding raises the importance of the aesthetic and functional integration of the technology into the architecture, where photovoltaic systems cease to be an “appendage” and become a multifunctional component of civil construction (Custódio; Reis, 2023).

Solar architecture is a design approach that seeks to optimise the use of solar energy to meet the energy needs of a building, minimising the consumption of non-renewable resources and promoting environmental comfort. In general, solar architecture can be understood from two main approaches: passive and active⁷.

Passive solar architecture consists of the direct use of light and heat from the sun, without the need for conversion into electricity or the use of complex mechanical equipment; it is based mainly on the choice of materials for the capture, storage and distribution of solar heat and light in buildings, in a natural way, that is, it involves passive mechanisms of thermal comfort.

Active solar architecture, on the other hand, involves the use of technological devices and mechanical systems to convert solar energy into other forms of energy. The main active components are (i) solar thermal collectors, which heat fluids – usually water – for sanitary use and space heating; and (ii) photovoltaic systems, which convert sunlight directly into electricity, through the photovoltaic effect. In a complementary manner, active solar architecture advocates the use of technological systems as active components – in substitution for or in complement to passive architectural elements, such as roofs, brises, cladding and façades – which, in addition to performing the conventional functions of shading,

⁷ The adoption of solar architecture – passive or active – combined with other bioclimatic strategies – such as natural ventilation and lighting, thermal insulation – enables the creation of environments with greater comfort and lower environmental impact, while also being energy efficient. For more information, see Lamberts, Dutra and Pereira (2014).

sealing and protection, can also generate electricity from solar radiation (Custódio *et al.*, 2020; Custódio; Reis, 2023; Zomer; Crestani, 2023).

Such an approach is not new, but its technical and aesthetic maturation has kept pace with the advances in photovoltaic technology, especially with the development of BIPV modules, which, in addition to generating energy, can also perform other constructive functions (Custódio *et al.*, 2020; Koike; Custódio; Rüther, 2023). Thus, BIPV represent one of the most promising solutions for the dissemination of solar photovoltaic energy in architecture, standing out both for enhancing the harmony between energy performance and the architectural concept, and for optimising the use of the built surface of buildings for energy generation (Koike; Custódio; Rüther, 2023; Custódio; Zomer; Rüther, 2020).

Although the adoption of BIPV is still incipient in Brazil, their growth potential is significant, especially in institutional, commercial and medium- to high-standard residential buildings, but also in Social Housing (HIS) projects (Zomer; Crestani, 2023; Custódio; Reis, 2023). However, there are few studies that relate the advances and possibilities of BIPV to the existing dynamics between the work of professionals in the field of architecture and urbanism and the expansion of photovoltaic technology, in the direction of the energy transition. The proposed research seeks to contribute to filling this gap and updating the debate in Brazil.

3 METHODOLOGY

In addition to the survey, analysis and literature review addressed in Section 2 – Theoretical Background –, the following methodological strategies were adopted in the research: (i) documentary research and analysis; (ii) quantitative and qualitative research, with the application of a questionnaire to architects and urban planners of the RMSP⁸; as well as (iii) interviews with experts on the photovoltaic theme.

The documentary research and analysis involved: the characterisation of photovoltaic systems, notably BIPV; the identification of strategies for disseminating photovoltaic technology by the Brazilian market; the study of the inclusion of content related to photovoltaic energy in the curriculum of six undergraduate courses in Architecture and Urbanism in the state of São Paulo; and the analysis of the relevant legislation.

The development of the quantitative and qualitative research included: the definition of the sample universe, in a statistical way⁹; the formulation and implementation of strategies to

⁸ The RMSP is composed of 39 municipalities and has 20.7 million inhabitants (IBGE, 2022). The state of São Paulo concentrates about one third of the architects and urban planners registered with the Council of Architecture and Urbanism – 70 thousand of 220 thousand professionals – with almost 60% – 40.7 thousand professionals – residing in and working in the RMSP (CAU/SP; CEBRAP, 2023).

⁹ To determine the sample size, the “sample calculation for finite populations” methodology was used (Gil, 2008), with a confidence level of 95% and a margin of error of up to 10%. The sampling calculation resulted in 96 questionnaires in total.

contact architecture and urbanism professionals and firms, which resulted in the participation of 172 professionals in the research, 124 of whom worked in the RMSP; the conducting of a pre-test; and the provision of an online questionnaire, for the survey of information on (a) the level of knowledge about photovoltaic technology, (b) the degree of importance of the postulated factors, which could influence the adoption or non-adoption of photovoltaic systems, as well as (c) aspects of the undergraduate education and continuing training of the professionals, (d) the influence of clients and partners, and (e) dissemination strategies of the Brazilian photovoltaic market.

The interviews deepened the themes addressed in the questionnaire, exploring the experiences and critical views of the experts regarding the use of photovoltaic systems.

Finally, the systematisation, tabulation, cross-referencing and analysis of the answers to the multiple-choice and essay questions were carried out, which made it possible to outline a panorama of the perception of architecture and urbanism professionals in relation to photovoltaic technology and to identify the main factors that would explain the non-adoption or the low-frequency adoption of solar photovoltaic power generation systems, in response to the hypothesis formulated.

4 BIPV-TYPE PHOTOVOLTAIC MODULES: POTENTIAL AND CHALLENGES FOR USE

As already mentioned, there are two types of photovoltaic modules: (i) BAPV – *Building Applied Photovoltaics* –, modules that are attached or added to buildings, generally existing ones; and (ii) BIPV – *Building Integrated Photovoltaics* –, modules that are directly integrated into or replace architectural elements, such as façades, roofs, brises and glass. BIPV modules come in various shapes, sizes, colours and textures, with semi-transparent, flexible, bifacial and even textured solutions; however, BIPV still cost more than BAPV. Nevertheless, the replacement of passive materials with multifunctional active materials, such as BIPV, can result in financial benefit, since the cost of the conventional materials that are no longer used must be deducted from the initial investment in the photovoltaic solutions (Koike; Custódio; Rüther, 2023).

The growth of BIPV-type modules in the world market has been occurring in view of the advantages of these integrated systems, above all because of the aesthetic issue and multifunctionality, among others such as: (1) generation of renewable energy, (2) energy efficiency, (3) architectural performance, (4) property value appreciation, (5) reduction of energy costs, and (6) durability, with a minimum guarantee of 25 years, superior to that of conventional cladding (Zomer; Crestani, 2023). In Brazil, the most commercialised photovoltaic modules are conventional modules, the BAPV of the monocrystalline silicon or

polycrystalline silicon type. However, there is already a concern in the national market to expand the commercialisation of integrated modules, the BIPV. The main models available in Brazil or for import are:

- **Flexible Thin Film modules** (Figure 1): more usual and common, they are used on curved surfaces, or directly on tiles, roofs or façades, having as their main characteristic, in addition to flexibility, lightness;
- **Coloured and Textured modules** (Figure 2): still little used in Brazil, they can replace façades with smooth cladding or glass-skin type; there are countless colours, including textured ones, that imitate other construction materials;
- **Bifacial modules** (Figure 3): quite common in Brazil, they are used in atriums, skylights and structures for covering vehicles (carports); their main characteristic is to generate energy on both sides, being usually installed in large and often open places, where solar incidence occurs both directly from the upper part, and diffusely from the lower part.

Figures 4, 5 and 6 present examples of the use of BIPV-type photovoltaic modules in brises, façades and roofs, respectively.

Figures 4, 5 and 6

Application of BIPV modules: Thin-film flexible, Colored, and Bifacial types

Source: Madeira (2025).

The Edmonton Convention Centre, in Canada (Figure 7), and the Copenhagen International School, inaugurated in 2017 in Denmark (Figure 8) – in which the photovoltaic modules cover the entire façade, replacing the cladding materials – are considered emblematic cases of BIPV use in the world. In Brazil, the pioneering experiences of the headquarters of the company TOTVS (Figure 9), inaugurated in 2017, and of the Germinare school (Figure 10), both in São Paulo, demonstrate the potential for using such systems in urban contexts, as well as the possibilities of integration with the architecture. At the TOTVS headquarters, the flexible photovoltaic modules are associated with part of the façade glazing: in addition to generating energy, the photovoltaic modules reduce the thermal load by around 75% by blocking part of the UV rays, also reducing the building's energy consumption (Madeira, 2025). At the Germinare school, the original project conceived in 2009 provided for the subsequent installation of brises with thin photovoltaic film which, in addition to producing solar energy, keep the internal temperature of the building much more pleasant, and also confer a contemporary aesthetic, both for the windows and for the façade (Zomer; Neris, 2023).

Despite the advantages, the adoption of integrated photovoltaic systems faces some challenges. The first concerns technical issues, which involve specifications of shading, solar orientation, angle of inclination, compatibility of constructive elements and maintenance aspects, which must be considered for their adequate performance. The second challenge refers to symbolic issues: many architects perceive solar modules as visual interferences, associating them with an “aesthetic contamination” of the architecture. This occurs, above all, when the systems are specified after the design of the project (Prieto; Ondenhave, 2021). This perception reinforces the relevance of BIPV in relation to BAPV, regarding the aspect of integration with the architecture.

Figures 7, 8, 9 and 10

Edmonton Convention Centre (Canada); Copenhagen International School (Denmark); TOTVS company headquarters (São Paulo); Germinare Business headquarters, J&F Institute (São Paulo)

Source: Madeira (2025).

Finally, it is worth highlighting that, although solar photovoltaic power generation presents low environmental impact, photovoltaic modules are not completely free of impact, especially at the end of their useful life, which demands the implementation of sustainable alternatives for the treatment of the waste generated when these systems are uninstalled (Miranda, 2019). Such treatment necessarily involves the appropriate disposal, reuse or recycling of the components of the photovoltaic modules. Federal Decree No. 10,240/2020 (Brasil, 2020) regulated the implementation of a mandatory reverse logistics system for electronic products – including solar photovoltaic panels – with the definition of responsibilities for manufacturers, importers, distributors and traders, aiming at the collection, transport, treatment and appropriate disposal of the waste from these products. The implementation of public policies aimed at recycling the components through the enhancement of reverse logistics may be the best path for confronting and mitigating the possible environmental damage arising from the adoption of photovoltaic technology.

5 RESULTS AND DISCUSSION

The conducting of the quantitative and qualitative research resulted in the responses of 124 architects and urban planners of the RMSP to the online questionnaire hosted on the

Google Forms platform – structured in three parts, with 14 multiple-choice questions, accompanied by fields for additional comments – and made it possible to gather information and data, which were tabulated and analysed quantitatively and qualitatively.

The first part of the questionnaire, with eight questions (Q01 to Q08), covered questions directly related to the factors postulated by the researcher that would explain the non-adoption or the low-frequency adoption of photovoltaic systems by architects and urban planners – **lack of knowledge about photovoltaic technology** and, in particular, **about BIPV**; **negative aesthetic impact**; and **cost of implementation**. It sought to identify, in addition to the level of knowledge of the respondents, the degree of importance attributed to the postulated factors, individually or in a comparative manner. The answers to questions Q1 to Q08 pointed to:

- **level of knowledge about photovoltaic technology** mostly “medium” (41.1%) or “low” (37.1%);
- **level of knowledge about BIPV**: prevalence of the “low” level (50%), followed by the “medium” level (37.1%);
- **degree of importance** – low, medium or high – attributed to the factors **negative aesthetic impact** and **cost of implementation**, individually: “high degree of importance” for both factors – 67.7% and 54%, respectively;
- **degree of importance** attributed to the factors **level of knowledge about photovoltaic technology** and **about BIPV**, **negative aesthetic impact** and **cost of implementation**, when compared: both factors proved to be important for the comparisons between (i) **cost of implementation** and **negative aesthetic impact** (68.5%); (ii) **cost of implementation** and **level of knowledge about the technology** (47.6%); and (iii) **level of knowledge about the technology** and **level of knowledge about BIPV** (49.2%); as for the comparison between the factors **level of knowledge about photovoltaic technology** and **negative aesthetic impact**, 65.3% of the answers indicated that the **level of knowledge** is more relevant than the **negative aesthetic impact**, a factor pointed out as more relevant by only 4.8% of the respondents.

The second part of the questionnaire, with two questions (Q09 and Q10), sought to understand the behaviour and attitude of the respondents in relation to the intention to specify or not photovoltaic technology, with and without the influence of clients. When asked about the intention to specify such systems, autonomously and spontaneously, that is, without the request of the clients, 91.1% of the respondents were broadly in favour of their adoption,

choosing the alternative *“I would always specify them in my projects”*. Among the justifications, the environmental aspect – adoption of sustainable solutions (65.3%) – outweighed the aspect relating to the savings generated by the photovoltaic systems (25.8%). As for the intention to specify photovoltaic systems when requested by clients, 53.2% of the respondents chose the alternative *“regardless of whether it is requested or not, I always try to specify or attempt to convince my clients of the importance of solar photovoltaic power systems”*, while 46.8% answered *“I only specify solar photovoltaic power systems if requested by the client”*.

The third part of the questionnaire, with four questions (Q11 to Q14), was formulated with a different logic. For questions Q11 and Q12, statements were presented for the indication of the degree of relevance, through the attribution of a numerical value between 1 (least representative) and 8 (most representative) to each of the statements.

Q11 presented **five statements** regarding the intention and reasons that lead to the specification or non-specification of photovoltaic systems. It sought to confront the answers to Q11 with those of the first and second parts of the questionnaire, and to identify possible conflicts. Most of the interviewees indicated “high relevance” for the statement: *“I always specify or suggest to my clients to include photovoltaic energy in projects”* (54.0%). The alternative “low relevance” prevailed for **three statements** *“I do not specify photovoltaic energy because I do not have mastery of the technology”* (53.2%); *“I do not specify photovoltaic energy because the solar modules will harm the aesthetics of the project”* (87.9%); and *“I do not specify photovoltaic energy due to the high cost of implementation”* (52.4%). Only for the statement *“I only specify photovoltaic energy when it is requested by the client”*, both options “low relevance” and “high relevance” reached 42.7% of the total answers.

Next, Q12 presented **seven statements** on other possible factors, beyond those postulated in the hypothesis – such as the training of architects and urban planners, dissemination of photovoltaic technology by the market, the attitude of partner professionals and the influence of environmental aspects – that could contribute to some extent to the non-adoption or the low adoption of photovoltaic technology.

Most of the respondents indicated “high relevance” for **three statements**: (i) *“the Faculties of Architecture and Urbanism are not adequately preparing future professionals for the use of this technology”* (66.9%); (ii) *“there are no adequate professional updating courses available and/or accessible”* (48.4%); and (iii) *“there is no efficient dissemination by the market of the available photovoltaic systems or of their benefits”* (55.6%).

For another **two statements** related to environmental issues – sustainability and possible impacts – most of the respondents indicated “low relevance”: (i) *“solar photovoltaic*

energy is not the best option for sustainable projects and for the preservation of the environment” (76.6%); and (ii) “photovoltaic technology also generates negative environmental impacts such as waste, and the life cycle of the materials is relatively short” – (48.4%).

However, **two statements** divided the group, with answers indicating a greater balance between the different degrees of relevance: (i) “partner professionals (mainly electrical engineers) discourage architects from using [photovoltaic technology] due to cost, technical issues or other factors”: “low relevance” (42.7%); “medium relevance” (25.8%); and “high relevance” (31.5%); and (ii) “photovoltaic technology contributes to economic development, but we live on a planet with limited natural resources, which would demand a slowing of the pace of development: “low relevance” (39.5%); and “high relevance” (35.5% of the total).

In question Q13, **five** (possible) **factors** related to the specification of photovoltaic systems were listed – **sustainability, cost, integration with the architecture/aesthetics, technical aspects** and **request by the client** – so that the respondents could rank each factor, from 1 to 5, according to its degree of relevance for the specification of the systems. The tabulated answers are represented in Graph 1.

Figure 11

Relevance of factors for adoption or non-adoption of photovoltaic technology

Source: Elaboration by the authors.

It was found that the factor that obtained the greatest number of answers as the one of “greatest relevance” was the factor **sustainability** (51.3%), followed by the factor **cost** (20.7%). The factor that obtained the greatest number of answers as the one of “least

relevance” was **request by the client** (43.0%), followed by the factor **technical aspects** (26.5%).

Finally, the last question of the third part (Q14) sought to ascertain the opinion of the respondents on the aesthetic outcome of a project with photovoltaic systems associated with the message conveyed by such a project: is it more relevant that the project conveys an image of sustainability, with the adoption of non-integrated modules (BAPV), or that the project incorporates integrated modules (BIPV), even if it does not clearly and evidently convey an image of sustainability? Most of the respondents (73.4%) indicated that they prefer to use integrated photovoltaic modules, which reveals a greater concern with the negative aesthetic impact of photovoltaic technology than with the message that such a solution might convey.

Based on the answers to the questionnaire, associated with the opinion of the experts, it was possible to outline a panorama of the perception of architects and urban planners in relation to photovoltaic technology, as well as to identify the potential and challenges to its adoption in the design process.

The answers to questions Q1 to Q4 showed that most of the respondents – around 80% – present reduced knowledge about photovoltaic technology, and an even lower level of knowledge about BIPV. They also indicated high importance for the factors “integration of the photovoltaic modules with the buildings and their aesthetic outcome” (67.7%) and “cost of implementation of solar photovoltaic power generation systems” (54%).

On the other hand, these results also revealed that few respondents present “high” knowledge about photovoltaic technology (21.8%) and about the available solutions integrated into buildings (12.9%); for this group of professionals, the importance in relation to the integration of the systems into the buildings is even greater (74.1%), while the importance in relation to cost is a little lower (44%). Thus, it can be deduced that the high knowledge about these systems results in greater knowledge about (i) the available solutions and their cost reduction over the last few years, (ii) the possibilities of providing for such systems in the design and their future execution, and (iii) other data and information that can contribute to the presentation and the convincing of clients for the adoption of the technology, including the aesthetic aspects.

The cross-tabulation of the answers to questions Q05 to Q08 – which related the three factors postulated in the hypothesis and their degree of relevance – indicated that the factor **lack of knowledge** about photovoltaic systems stood out in relation to the others, surpassing the factors **cost of implementation** and **negative aesthetic impact**, which occupied the

second and third positions, respectively, in terms of importance and influence on the specification of photovoltaic technology.

The answers to the second and third parts of the questionnaire indicate that:

- there is a high degree of acceptance of the technology, associated with the importance of adopting sustainable solutions, which can be measured by the answers to: (1) Q09 – “if it depended on them [architects and urban planners], they would always specify photovoltaic systems” (91.1%); (2) Q10 – “I always try to specify, regardless of whether it is requested by the client or not” (53.2%); (3) Q12 – low relevance for statement 5 “solar photovoltaic energy is not the best option for sustainable projects and for the preservation of the environment” (76.6%); and (4) Q13 – “sustainability” as the parameter of greatest relevance, in the decision to specify photovoltaic systems (51.3%);
- the factors **level of knowledge**, **negative aesthetic impact** and **cost of implementation**, presented independently, that is, not being compared with one another, present “low relevance” for the non-specification of the technology; however, in the case of the factor **negative aesthetic impact**, the high percentage of “low relevance” (87.9%) stands out in comparison with the percentages for the factor **level of knowledge** (53.2%) and **cost of implementation** (52.4%);
- both the education and the continuing training of architects and urban planners contribute to the low level of knowledge in relation to photovoltaic systems and BIPV – with “high relevance” (66.9%) for statement 1 of Q12 “*the Faculties of Architecture and Urbanism are not adequately preparing future professionals for the use of this technology*”, and 48.4% and 34.7% as “high” and “medium relevance”, respectively, for statement 2 of Q12 “*there are no adequate professional updating courses available and/or accessible*”; this finding of the research is corroborated by the experts: the lack of preparation generates the lack of knowledge, reflecting directly on the professional's decision on whether or not to use photovoltaic systems;
- the dissemination of the technology and of the products available by the market is not efficient, that is, it is not reaching the professionals in the field of architecture and urbanism, with 55.6% and 26.6% as “high” and “medium relevance”, respectively, for statement 3 of Q12 “*there is no efficient dissemination by the market of the available photovoltaic systems or of their benefits*”; for the experts consulted, there is no exclusive targeting of the dissemination towards the architect but rather towards the professionals who work with photovoltaic energy in general, including architects: the dissemination for the architecture and urbanism professional could have another

approach, in a more specific way, and include the dissemination of BIPV-type modules and of the principles of solar architecture;

- the relationship with partners, in particular with electrical engineers, is neither a motivating nor a demotivating factor for the specification of the technology – due to the more balanced percentages of the answers to statement 4 of Q12 “*partner professionals (mainly electrical engineers) discourage architects from using it due to cost, technical issues or other factors*” (31.5% “high relevance”, 25.8% “medium relevance”, and 42.7% “low relevance”).

Finally, it is worth mentioning that the environmental dimension is a central aspect for architects and urban planners: behind the decision or intention to specify photovoltaic systems, the sustainability factor appeared prominently. However, the vast majority of the professionals who answered the questionnaire prefer to specify a system integrated into the building, that is, a BIPV system; in this sense, the sustainability message, which would be highlighted with BAPV solutions, did not prove to be as relevant as the integration of the photovoltaic technology with the architecture, which indicates that the factor negative aesthetic impact must be considered in the preparation of the project.

6 CONCLUSION

The research presented and discussed in this article sought to understand the dynamics that exist between the work of architects and urban planners and the expansion of solar photovoltaic energy, with the main focus being to identify the reasons that lead such professionals not to adopt, or to adopt with low frequency, the use of this technology.

From the 124 answers to the questionnaire of the quantitative and qualitative research, it was possible to respond to the hypothesis formulated, as well as to identify other factors and constraints that can influence the adoption or non-adoption of photovoltaic technology.

The answers to the first part of the questionnaire, in particular, indicated that the factor of greatest relevance, among the three factors postulated in the hypothesis, corresponds to the **lack of knowledge of architects and urban planners about photovoltaic systems** and, in particular, **in relation to BIPV**, followed by the factor cost of implementation. Although architects and urban planners point to a high degree of relevance for the integration of the photovoltaic modules with the buildings and their aesthetic outcome, the importance of the factor negative aesthetic impact for the adoption of photovoltaic technology was relativised by the research findings.

In addition, it was found that both academic education and continuing training, as well as the inefficient dissemination of photovoltaic technology by the Brazilian market, contribute to the low level of knowledge of the professionals, which ends up also influencing the knowledge about the cost of implementation of photovoltaic technology, which has been decreasing in recent years, or even about the possibilities brought by the new solutions integrated into buildings, the BIPV modules. The broadening of the knowledge of architects and urban planners, both about BIPV-type photovoltaic modules and about the principles of active solar architecture, involves the incorporation of this theme into the curricula of undergraduate courses in Architecture and Urbanism; the confronting of the challenge of ensuring access to quality complementary and continuing training; as well as a more efficient strategy for disseminating solar photovoltaic technology by the Brazilian market, which reaches the professionals in the field of architecture and urbanism.

The research findings reinforce the need (i) to implement public policies to encourage training and the expansion of solar photovoltaic energy; (ii) for greater articulation between the productive sector and architects and urban planners – for their strategic role in the production of the built environment and in confronting the climate crisis, as well as in reducing electricity consumption in urban areas –; and (iii) to carry out informative campaigns directed at professionals in the field of architecture and urbanism, but also at civil society in general.

Based on the results achieved and the gaps perceived, new research possibilities can be envisaged, arising from various aspects related to the adoption of solar photovoltaic technology not contemplated by the research that underpins this article. In this sense, the development of future works is suggested that address the following themes: analysis of the technical and financial feasibility for the preparation of projects incorporating BIPV, considering the characteristics and use of the building and the purchasing power of the client; challenges and potential for the use of BIPV photovoltaic modules in HIS, in public housing provision programmes, such as the federal government's Minha Casa Minha Vida, with a focus on the design possibilities and cost of the solutions; and a comparative study of public policies to encourage solar photovoltaic energy in Brazil and in international contexts.

Laudo Natel Mateus¹

ABSTRACT

This article investigates the evidentiary challenges in characterizing gender quota fraud before the Regional Electoral Court of Goiás (TRE-GO) between 2022 and 2025, in light of TSE Súmula nº 73 and TSE Resolution nº 23.735/2024. It argues that the deliberately open wording of these norms, combined with the structurally circumstantial nature of the evidence and the material inequalities affecting women's political participation, shifts the decisional center to judicial evaluation and renders the individualized analysis of female candidacies unavoidable. The research adopts a descriptive-analytical and exploratory approach, combining the historical-normative reconstruction of the quota policy and the jurisprudential trajectory of the TSE (from the Valença/PI and Jacobina/BA precedents to the consolidation of the evidentiary model) with the observation of four paradigmatic TRE-GO rulings, taken as empirical references showing how factually similar cases lead to opposite outcomes due to the centrality of the inferential articulation among indicia. It defends understanding fraud as an inferential illicit act, proposes the analytical category of gender procedural violence, and formulates a three-axis interpretive model: qualified evidentiary convergence, centrality of individualized analysis, and rigor in making the inferential path explicit. It concludes that the evidentiary challenges are not contingent but structural, and that the institutionally adequate response lies not in rigid standardization of criteria, but in enhancing the inferential rationality of the decision.

RESUMO

O artigo investiga os desafios probatórios na caracterização da fraude à cota de gênero no âmbito do Tribunal Regional Eleitoral de Goiás (TRE-GO), entre 2022 e 2025, à luz do enunciado nº 73 da Súmula do TSE e da Resolução TSE nº 23.735/2024. Sustenta-se que a redação deliberadamente aberta dessas normas, somada à natureza estruturalmente indiciária da prova e às desigualdades materiais que afetam a participação política das mulheres, desloca o centro decisório para a valoração judicial e torna inevitável a análise individualizada das candidaturas femininas. A pesquisa adota abordagem descritivo-analítica e exploratória, articulando a reconstrução histórico-normativa da política de cotas e a trajetória jurisprudencial do TSE (dos precedentes de Valença/PI e Jacobina/BA à consolidação do modelo probatório) com a observação de quatro julgados paradigmáticos do TRE-GO, tomados como referências empíricas que evidenciam como casos faticamente similares conduzem a desfechos opostos pela centralidade da articulação inferencial entre indícios. Defende-se a compreensão da fraude como ilícito de natureza inferencial, propõe-

se a categoria analítica da violência processual de gênero e formula-se um modelo interpretativo de três eixos: convergência probatória qualificada, centralidade da análise individualizada e rigor na explicitação do percurso inferencial. Conclui-se que os desafios probatórios não constituem fenômeno contingente, mas resultado estrutural, e que a resposta institucionalmente adequada não reside na padronização rígida de critérios, mas no aprimoramento da racionalidade inferencial da decisão.

Palavras-chave: Cota de Gênero. Fraude. Prova Indiciária. Análise Individualizada. Justiça Eleitoral.

RESUMEN

El artículo investiga los desafíos probatorios en la caracterización del fraude a la cuota de género en el ámbito del Tribunal Regional Electoral de Goiás (TRE-GO), entre 2022 y 2025, a la luz del enunciado n° 73 de la Súmula del TSE y de la Resolución TSE n° 23.735/2024. Se sostiene que la redacción deliberadamente abierta de esas normas, sumada a la naturaleza estructuralmente indiciaria de la prueba y a las desigualdades materiales que afectan la participación política de las mujeres, desplaza el centro decisorio hacia la valoración judicial y torna inevitable el análisis individualizado de las candidaturas femeninas. La investigación adopta un enfoque descriptivo-analítico y exploratorio, articulando la reconstrucción histórico-normativa de la política de cuotas y la trayectoria jurisprudencial del TSE (de los precedentes de Valença/PI y Jacobina/BA a la consolidación del modelo probatorio) con la observación de cuatro fallos paradigmáticos del TRE-GO, tomados como referencias empíricas que evidencian cómo casos fácticamente similares conducen a desenlaces opuestos por la centralidad de la articulación inferencial entre indicios. Se defiende la comprensión del fraude como ilícito de naturaleza inferencial, se propone la categoría analítica de la violencia procesal de género y se formula un modelo interpretativo de tres ejes: convergencia probatoria cualificada, centralidad del análisis individualizado y rigor en la explicitación del recorrido inferencial. Se concluye que los desafíos probatorios no constituyen un fenómeno contingente, sino un resultado estructural, y que la respuesta institucionalmente adecuada no reside en la estandarización rígida de criterios, sino en el perfeccionamiento de la racionalidad inferencial de la decisión.

1 INTRODUCTION

Women's political participation in Brazil remains crossed by structural asymmetries, even after the 1988 Constitution affirmed substantive equality as a foundation of the democratic order. Such asymmetries manifest themselves not only in women's numerical under-representation in elective offices, but also (and in a particularly sensitive way) in the manner in which the legal system interprets, produces and evaluates evidence when called upon to intervene in disputes related to gender policy.

The barriers to women's participation do not arise from episodic factors or individual inadequacies, but from structural devices that condition women's access to party structures, campaign resources, political visibility and, consequently, real conditions of competitiveness. This backdrop influences not only the political-electoral process, but the litigation itself, especially in the sensitive field of actions discussing gender quota fraud.

The quota policy provided for in Article 10, § 3, of Law nº 9.504/1997² has consolidated itself as one of the most relevant instruments of affirmative action in Brazilian Electoral Law, aimed not only at ensuring the formal presence of women on proportional slates, but at promoting their effective inclusion in the democratic process. The normative consolidation of the quota was accompanied, however, by a paradoxical phenomenon: the proliferation of fictitious female candidacies and the growth of Electoral Judicial Investigation Actions (AIJE) grounded in the allegation of quota fraud.

In various contexts, the AIJE ceased to be merely an instrument for safeguarding the normality of the election and became a strategic mechanism for the global challenge of proportional slates, with a direct impact on altering the result.

From this emerges the central problem of this investigation: the difficulty of establishing evidentiary criteria that are sufficiently dense and coherent to distinguish structural fraud from those situations in which real female candidacies (even if weakened by material inequalities) end up improperly classified as fictitious. This grey zone produces symmetrical risks: on the one hand, unjust revocations of legitimately won mandates; on the other, the improper maintenance of Statements of Regularity of Party Acts (DRAP), even in the face of practices that empty the purpose of affirmative policy.

The very unfeasibility of a rigid standardization of the evidentiary analysis thus constitutes the structuring axis of the problem: recent experience demonstrates that quota fraud is not revealed by a single isolated element, nor does it admit automatic solutions or replicable decision-making models.

²BRAZIL. Law No. 9,504, of September 30, 1997. Art. 10, § 3: "Of the number of seats resulting from the rules provided for in this article, each party or coalition must reserve a minimum of thirty percent and a maximum of seventy percent for candidacies of each sex."

This methodological choice imposes a relevant consequence: the need to examine gender quota fraud not only as an abstract legal category, but as a concrete decisional phenomenon, produced within specific judicial proceedings, from incomplete evidence, fragmented indicia and competing narratives. The analysis of the evidentiary challenge, therefore, is not to be confused with the dogmatic reconstruction of the institute, but with the critical observation of how the law operates when called upon to decide under conditions of uncertainty.

The specific scope of the work does not examine the normative requirements of Súmula nº 73 or of Resolution nº 23.735/2024 as abstract commands, nor does it discuss their validity or legitimacy; the central object consists in understanding how, in jurisdictional practice, the occurrence of fraud is proven, what challenges are faced by the Electoral Justice and how normative indeterminacy (expressed in formulas such as “when the facts and circumstances of the concrete case so permit the conclusion”) impacts the coherence, predictability and justice of decisions.

At the international level, the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW)³, the Convention of Belém do Pará⁴, the Beijing Platform for Action (1995) and Sustainable Development Goal (ODS) nº 5 of the 2030 Agenda reinforce that women's political participation does not constitute a mere programmatic aspiration, but an international legal obligation. At the jurisprudential level, the response of the Superior Electoral Court (TSE) culminated in the consolidation of an evidentiary model of a circumstantial nature, systematized in enunciado nº 73 of that court's Súmula⁵, whose deliberately open wording transfers the decisional center to judicial evaluation.

This choice is deepened by TSE Resolution nº 23.735/2024⁶, which dispenses with the demonstration of the subjective element (*consilium fraudis*), definitively shifting the focus to the objective-evidentiary plane.

The following problem is thus formulated: in what way do the evidentiary challenges in ascertaining gender quota fraud, in light of enunciado nº 73 and of TSE Resolution nº 23.735/2024, influence the jurisprudence of the TRE-GO, being able to lead both to unjust revocations and to the improper maintenance of DRAP, rendering the individualized analysis

³CEDAW, Convention on the Elimination of All Forms of Discrimination against Women, adopted on Dec. 18, 1979. Promulgated in Brazil by Decree No. 4,377, of September 13, 2002, art. 1.

⁴BRAZIL. Decree No. 1,973, of August 1, 1996. Promulgates the Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women (Convention of Belém do Pará), arts. 1 and 7.

⁵BRAZIL. TSE. Precedent No. 73: “Fraud against the gender quota occurs when, given the factual and circumstantial elements of the specific case, the distortion of the purpose of the rule provided for in art. 10, § 3, of Law No. 9,504/1997 is evidenced.” Approved in the plenary session of May 24, 2022.

⁶BRAZIL. TSE. Resolution No. 23,735, of February 27, 2024, art. 8, § 4: “For the characterization of fraud against the gender quota, the distortion of the purpose of the rule is sufficient, and the demonstration of the subjective element is dispensable.”

of female candidacies unavoidable? The central hypothesis is that the factual diversity of cases, the circumstantial nature of the evidence and the normative choice for open concepts prevent the consolidation of standardized criteria, leading the TRE-GO to decide on the basis of contextual reconstructions which, although they promote material justice, increase the risk of dissonant decisions and of strategic instrumentalization of AIJE.

The general objective is to analyse how these challenges impact regional jurisprudence in the period from 2022 to 2025, highlighting the limits of decisional standardization and the centrality of individualized analysis.

Methodologically, a descriptive-analytical and exploratory approach is adopted. The normative and jurisprudential reconstruction is compared with four rulings of the TRE-GO relating to the 2024 municipal elections, Campos Belos, Nerópolis, Aparecida de Goiânia and Goianira⁷, here taken not as an object of exhaustive description, but as empirical references that illustrate the central thesis. The selection is justified by a methodological trait: the first two were judged in the same plenary session, under an identical collegiate composition; the last two, already under the validity of the Resolution and under the action of a single rapporteur. This identity of conditions neutralizes external variables and isolates the evaluation of the evidence as the determining factor.

It is recorded, with epistemological transparency, that the researcher's activity in the Electoral Justice during the period demanded permanent methodological vigilance, a stance of *participant objectivation*, the research having been developed exclusively from an academic perspective, without reproduction of votes or judgments of correctness of the decisions. Far from compromising the work, this dual insertion is assumed as an explicit epistemological datum: proximity to the object, when submitted to rigorous methodological control, offers qualified access to the concrete dynamics of the formation of judicial conviction, provided it is accompanied by the deliberate refusal of any pretension to validate or invalidate the decisions examined.

The object of the analysis is not the correctness of the rulings, but the structure of the evidentiary reasoning manifested in them.

2 STRUCTURAL EXCLUSION AND THE QUOTA POLICY AS AN INSTITUTIONAL RESPONSE

The analysis of gender policy in Electoral Law presupposes the understanding that women's under-representation does not constitute a contingent or accidental phenomenon, but the result of a long, structural and institutionally reproduced historical process (Pateman,

⁷BRAZIL. TRE-GO. Electoral Judicial Investigation Action No. 0600639-47.2024.6.09.0105 (Campos Belos/GO); Electoral Appeal No. 0600797-61.2024.6.09.0054 (Nerópolis/GO); Electoral Judicial Investigation Action No. 0600544-33.2024.6.09.0132 (Aparecida de Goiânia/GO); and Electoral Judicial Investigation Action No. 0600937-51.2024.6.09.0101 (Goianira/GO). 2024 municipal elections.

1988). The construction of liberal constitutionalism, frequently presented as the foundational milestone of legal equality, operated, in practice, through a profound cleavage between the public space and the private space, consolidating a sexual division of power according to which politics and collective representation were historically associated with the masculine universe.

The feminist theory of the social contract offers a decisive analytical instrument: the modern political pact, although formulated under a universalist promise, was erected upon a “sexual contract” that confined women to the private space and reserved to men the legitimate exercise of public authority. That is why the conquest of suffrage, although fundamental, did not immediately break with the patterns of exclusion: the formal entry of women into the electorate did not automatically translate into their effective incorporation into decision-making spaces, with the systematic difficulty of transforming candidacies into viable political projects persisting.

The finding that formal equality does not promote substantive inclusion led, from the second half of the twentieth century, to the consolidation of an international normative framework. CEDAW (1979) breaks with the merely formal conception of equality by recognizing, in its Article 4, that special measures of a temporary character aimed at accelerating de facto equality do not constitute discrimination, legally legitimizing affirmative action policies, and by imposing, in its Article 7, the state duty to ensure conditions of equality in the right to vote, to be voted for and to hold public office.

The incorporation of the Convention into the Brazilian legal order, with supralegal status⁸, expands the normative density of gender policies. This movement is deepened by the Convention of Belém do Pará (1994), which reaches institutional and structural practices of violence, and by the Beijing Platform for Action (1995), which affirms that the full participation of women is an essential condition of democracy. This normative body operates a paradigmatic transition: from the paradigm of formal equality (which is satisfied with the removal of explicit legal barriers) to that of substantive equality, which recognizes inequality as a product of institutional structures and imposes upon the State the positive duty to correct it.

Within this framework, it is understood that the gender quota policy is not situated only in the plane of electoral engineering, but in the broader field of human rights and substantive democracy.

The data confirm the persistence of the deficit: according to the IPU (2025), women occupied 11.3% of parliamentary seats worldwide on the eve of Beijing, a percentage that

⁸BRAZIL. STF. RE 466,343/SP. Reporting Justice: Cezar Peluso. Judged on Dec. 3, 2008. Recognized supralegal status to international human rights treaties not approved under the terms of art. 5, § 3, of the Federal Constitution.

reached 27.2% in 2025, expressive growth, but far from parity. Comparative analysis reveals profound regional asymmetries: Latin American countries that combined robust legal quotas, rigorous oversight and effective sanctions, such as Argentina, México and Bolívia, advanced from a policy of minimum quotas to models of parity, reaching percentages close to or above 45% (Piatti-Crocker, 2019).

In contrast, democracies with fragmented, personalist or low-institutionalization party systems tend to convert the quota into a mere numerical increase of registrations, without corresponding growth in the number of women elected. These cases demonstrate that affirmative action, when conceived as a consistent public policy and protected against mechanisms of neutralization, is capable of producing substantive results; when inserted into an environment resistant to internal democratization, it tends to be captured.

In Brazil, the incorporation of gender policy occurred in a belated, gradual and reactive manner. The formation of the national political system reproduced, in a particularly intense way, the patriarchal patterns inherited from European liberal constitutionalism, combined with local specificities such as the concentration of power in the parties, political personalism and the low institutionalization of party structures.

Unlike countries that advanced through constitutional reforms or explicit political pacts in favour of parity, Brazil entered the theme in a fragmented manner, with successive legislative changes that sought to confront under-representation without profoundly altering the internal dynamics of the parties. Law nº 9.100/1995 provided for a facultative reservation of seats and, in the absence of sanctions, proved innocuous; Law nº 9.504/1997 raised the percentage to 30%, but maintained ambiguity by employing the verb “to reserve”; only Law nº 12.034/2009⁹ promoted a qualitative change, by replacing reservation with mandatory fulfilment.

This inflection triggered adaptive reactions: there was an expressive increase in registered female candidacies without proportional growth in women elected; in 2018, although women represented more than 30% of candidacies for the Chamber of Deputies, only about 15% of seats were occupied by female parliamentarians, despite women constituting approximately 53% of the electorate. Jurimetric surveys identified, in the 2020 elections, more than 1,600 proceedings related to quota fraud (UFG, 2024), and comparative studies of the G20 place Brazil among the economies with the lowest female participation in spaces of power (IBGE, 2024).

Under-representation, therefore, does not arise from the absence of rules, but from the insufficiency of mechanisms capable of ensuring their material effectiveness, which led to the

⁹BRAZIL. Law No. 12,034, of September 29, 2009. Replaces the logic of “reservation” with the mandatory filling of the minimum percentage of candidacies of each sex, making the approval of the DRAP conditional on its fulfilment.

progressive displacement of the centre of gravity of the protection of affirmative action to the Electoral Justice.

The gender quota is not a simple technique of arithmetic correction, but an instrument aimed at confronting structural inequalities reproduced within the political system. Its introduction does not eliminate the structures of exclusion; on the contrary, these reorganize themselves, producing new forms of neutralization. It is at this point that the connection with the notion of institutional political violence is established: the instrumentalization of female candidacies (registered only to fulfil formalities, without real support or intention to compete) is inserted into this category.

Law nº 14.192/2021¹⁰ consolidates this understanding: although it does not expressly typify quota fraud, its conceptual framework is compatible with the reading that fictitious candidacies constitute institutional violence, since they use women as bureaucratic instruments for the preservation of masculine structures of power (Laena, 2023).

The symbolic dimension is central to this analysis. Affirmative action communicates to society that women must occupy decision-making spaces and that their participation is a condition of democratic legitimacy; when captured by practices of simulation, the symbolic effect is inverted: instead of promoting inclusion, it reinforces stereotypes of incapacity, disinterest or inadequacy of women to politics. The literature points out that fictitious candidacies transmit the social message that women are not suited to politics, perpetuating exclusionary imaginaries and discouraging future female participation (Laena, 2023).

The dimension is, moreover, intersectional, insofar as Black, peripheral, indigenous women and members of historically marginalized groups are the most vulnerable to party instrumentalization, since they have less institutional protection and less capacity for internal contestation (Crenshaw, 1989). From this arises a relevant implication for the Electoral Justice: the reading that treats fictitious female candidates as authors of the illicit act is rejected, recognizing them, in many cases, as victims, and an evidentiary approach sensitive to structural asymmetries is required, avoiding automatic presumptions that may re-victimize women who effectively attempted to participate in the contest.

The requirement of individualized analysis of female candidacies fulfils, within this framework, a dual and essential function. On the one hand, it protects women who effectively participated in the contest, preventing real campaigns from being confused with artificial arrangements and authentic candidates from being penalized by generalizing patterns. On the other, it prevents the legitimization of merely formal candidacies, instrumentalized by the parties to fulfil legal requirements without any intention of promoting substantive inclusion. It is

¹⁰BRAZIL. Law No. 14,192, of August 4, 2021, art. 3. Defines political violence against women as any action, conduct or omission whose purpose is to prevent, hinder or restrict the exercise of their political rights.

a mechanism that seeks to balance the protection of affirmative action with the preservation of legal certainty, recognizing the evidentiary complexity inherent in structural illicit acts.

It is precisely this balance that the following chapter examines, by reconstructing the trajectory through which the superior Electoral Justice built the evidentiary criteria intended to confront fraud without compromising the protection of the women whom gender policy seeks to benefit.

It is also important to emphasize that gender quota fraud emerges not as a punctual anomaly, but as an adaptive strategy for the reproduction of power. Each normative advance (the obligation of fulfilment, the allocation of campaign fund resources, the control of financial movement) was followed by new forms of neutralization, more sophisticated and dissimulated. This adaptive character is decisive for the understanding of the evidentiary challenge: as fraudulent practices become less explicit, direct evidence becomes progressively rarer, and the weight of circumstantial inference more central.

The very evolution of the phenomenon pushes the legal system towards the terrain of contextual evaluation, in which the distinction between the instrumentalized candidacy and the weakened candidacy becomes ever more subtle, and, for that very reason, ever more dependent on the quality of the evidentiary reasoning mobilized by the judge.

3 THE JURISPRUDENTIAL CONSTRUCTION OF THE EVIDENTIARY MODEL IN THE TSE

The evidentiary model in force derives from a progressive hermeneutic construction. The *leading case* of Valença do Piauí¹¹ revealed the architecture of fictitious candidacies: all the investigated candidates presented an absolute absence of campaign acts, empty or symbolic accountability, null or negligible votes and (a decisive datum) direct kinship ties with male candidates of their own coalitions. The objective analysis of the case records demonstrated that, disregarding the fictitious candidacies, the male slates became numerically unviable, evidencing that the fraud was not peripheral, but structural.

The extreme similarity of the accountability reports (values, dates and numerical sequence of the invoices) denoted accounting make-up, demonstrating that the Court relied not only on the absence of a campaign, but on documentary evidence of the fabrication of a basis. The TSE established that the requirement of robust and unequivocal evidence is not to be confused with direct evidence, fraud normally being constructed from a set of convergent indicia, and that, once recognized, the revocation of the registrations and diplomas of all

¹¹BRAZIL. TSE. Special Electoral Appeal No. 0000193-92.2016.6.18.0018 (Valença/PI). Reporting Justice: Jorge Mussi. Judged on Sept. 17, 2019.

candidates linked to the DRAP is imposed, since it is a defect of origin, while the accountability of party leaders without proof of participation is however excluded¹².

Valença/PI thus established the fundamental coordinates of the hermeneutics of fraud (Targino; Sampaio Júnior, 2020).

The Jacobina/BA case¹³ refined these criteria in the face of a more complex and less explicit evidentiary set. In Jacobina, the fraud was not presented in a clean and homogeneous form, but through nuances and dissimulations, attempts to simulate minimal campaign acts, generic declarations of support and, in one of the testimonies, the acknowledgement that the investigated party was unaware of being registered as a candidate, a situation that exemplifies what feminist theory calls “candidacy as a borrowed body”.

In reforming the regional decision, which had adopted a restrictive understanding of robust evidence, the TSE reaffirmed that this does not require positive certainty, but a coherent, convergent and contextual set of indicia, evaluated as a whole; and that minimal campaign acts, when isolated or devoid of organicity, do not exclude the possibility of fraud. The model of “circumstantial robustness” was consolidated, according to which the manipulation of the quota may assume hybrid forms, with candidacies that appear to have some movement, but whose essence remains instrumental.

One aspect of these precedents projects directly onto the evidentiary challenge: the extent of the sanctions. The jurisprudence consolidated from Valença/PI admits the revocation of the entire proportional slate, regardless of the demonstration of direct participation of all candidates, on the grounds of the structural nature of the illicit act, the defect of origin contaminates the slate as a whole, imposing the nullity of votes and the recounting of the electoral quotient.

This model of expanded accountability, although coherent with the understanding of fraud as a systemic phenomenon, may imply relevant tensions with due process of law and with the principle of subjective responsibility, especially when it reaches female candidacies that did not participate in the fraud and that, in many cases, were victims of it (Cunha; Bastos Junior, 2020). The severity of the consequences raises, in turn, the level of evidentiary requirement: the more serious the effects of the recognition of the illicit act, the more rigorous must be the demonstration of its occurrence, which reinforces the centrality of the standard of robust and convergent evidence and the caution imposed by the principle *in dubio pro suffragio*.

¹²BRAZIL. TSE. Precedent No. 24: “A party leader who acted within the limits of his legal and statutory duties is not a legitimate defendant in an electoral judicial investigation action.”

¹³BRAZIL. TSE. Interlocutory Appeal in the Interlocutory Appeal in Special Electoral Appeal No. 0600651-94.2020.6.05.0046 (Jacobina/BA). Justice responsible for the ruling: Alexandre de Moraes. Judged in 2021.

This jurisprudential accumulation culminated in enunciado nº 73, which systematized the understanding that fraud may be recognized on the basis of grave, precise and convergent indicia, evaluated as a whole and not in isolation. The enunciado did not arise suddenly: it resulted from a long trajectory marked by divergent decisions among the Regional Courts, some requiring direct evidence of fraudulent intent, others recognizing fraud only from the absence of a campaign, others still admitting circumstantial evidence without clarity as to the degree of robustness required.

In the face of this heterogeneous scenario, and after the accumulation of reiterated and uniform decisions, the TSE opted for the issuance of a *súmula* as an instrument of stabilization of expectations and of reduction of decisional fragmentation. Two recurrent formulations in the Court's debates condense its epistemology: fictitious candidacies leave no confessions, but traces, it being incumbent upon the Electoral Justice to interpret them; and robust evidence cannot be confused with impossible evidence, under penalty of transforming affirmative action into a dead letter.

The enunciado thus consecrates the recognition that substantive equality policies require sophisticated interpretive mechanisms, capable of identifying dissimulations and minimal simulations of a campaign, and that fraud should not be analysed from the perspective of subjective culpability, but as a structural dynamic that distorts electoral competition.

TSE Resolution nº 23.735/2024, by positivizing circumstantial criteria (Article 8, §§ 2 to 5) and dispensing with the subjective element (Article 8, § 4), conferred greater predictability as to the admissible elements, without eliminating the centrality of inferential evaluation: the positivization began to operate as a formally structured analytical matrix, requiring from the judge a corresponding argumentative burden as to the articulation among the indicia. The dispensing with the subjective element by instruction raises a still-open question as to the limits of the regulatory power in light of Article 105 of Law nº 9.504/1997, deserving its own doctrinal treatment;

on the empirical plane, however, this controversy proves secondary, since the evidentiary structure remains the same, with or without the subjective element, because the evaluation invariably depends on the inferential articulation of the indicia. The coexistence of the enunciado and the resolution established, in synthesis, a coherent regulatory model, in which the standard of robust and convergent evidence operates as an epistemological filter against precipitate inferences, without the positivization of the criteria having modified the fundamental logic of the decision: the presence or absence of inferential articulation among the indicia continues to be the decisive point.

This normative arrangement is articulated with a principle of restraint that permeates the entire matter: the *in dubio pro suffragio*. In actions of a sanctioning nature, in which the gravity of the consequences (revocation of registrations, diplomas and mandates, nullity of votes and recalculation of the quotient) imposes rigour in the demonstration of the facts, evidentiary doubt is not supplied by presumption, but resolved in favour of the preservation of the electoral result.

This principle is not a mere tie-breaking rule, but a structuring criterion of evaluation: it recognizes that the error of condemning an authentic candidacy as fictitious and the error of acquitting a real fraud are not symmetrical in their democratic consequences, and it establishes, in the face of irreducible uncertainty, a preference for popular sovereignty. The articulation between the requirement of robust evidence and the *in dubio pro suffragio* thus composes the framework within which the judge exercises inferential evaluation, a framework that delimits, without eliminating, the margin of indeterminacy inherent in the illicit act.

4 THE EVIDENTIARY CHALLENGES IN REGIONAL APPLICATION: EVIDENCE AS THE DECISIONAL CENTRE

The preceding normative and jurisprudential reconstruction provides the framework from which the concrete application of the evidentiary model by the TRE-GO is observed. It is not intended here to provide an exhaustive description of the case records, but to mobilize four rulings as empirical references that illuminate the central thesis: that the evidentiary challenge, far from constituting an episodic difficulty, is a structural element of the model itself. The analytical value of these rulings resides less in their individual content than in their comparative arrangement, particularly in the fact that pairs of factually analogous cases, judged under identical institutional conditions, led to opposite outcomes.

It is this controlled asymmetry that allows the evaluation of the evidence, and not the norm, to be isolated as the determining variable.

The observation of the four TRE-GO rulings confirms that the evidentiary challenge is not contingent, but structural. The most eloquent trait of the sample is methodological: factually analogous cases, judged under an identical normative framework, led to opposite outcomes, and the divergence is not located in the plane of the facts, but in the manner in which the evidence is interpreted. Campos Belos and Nerópolis, judged in the same plenary session and by the same collegiate composition, shared a similar factual basis: female candidacies with reduced voting, limited financial movement and absence of an ostensible campaign.

In Campos Belos, the convergence of these negative indicia sustained the inference of fraud, with the sentence recognizing the non-existence of “minimally identifiable electoral protagonism”; in Nerópolis, the same elements were interpreted as ambiguous data, and the existence of disclosure on social networks, campaign materials and movement compatible with the candidate's reality led to dismissal, reinforced by an intra-list comparative criterion, precariousness was not exclusive to the challenged candidate, but a structural characteristic of the group. The contrast, between two cases decided in the same collegiate body, isolates the evaluation of the evidence as the determining variable (Streck, 2011).

Aparecida de Goiânia and Goianira, judged already under Resolution nº 23.735/2024 and by the same rapporteur, confirm the diagnosis in a qualitatively distinct key. In Aparecida de Goiânia, the evidentiary configuration was complex; alongside the usual indicia, the absence of electoral quittance and the explicit support for another candidate stood out, a datum that shifted the axis of the analysis from the absence of one's own campaign to deviated political action. The decisive distinction emerged between the fictitious candidacy, which presupposes the non-existence of intention to compete, and the unviable candidacy, formally registered but without material conditions of viability;

the *ratio decidendi* consolidated that the formal fulfilment of the quota does not inhibit the material examination, but the characterization of fraud requires robust and convergent evidence of the finalistic distortion, unviability not being confused with simulation. In Goianira, the indicia admitted a plausible alternative explanation: the finding of a tacit withdrawal, arising from a supervening loss of political support, explained in a non-fraudulent way the low intensity of the electoral acts.

This category, although not provided for in the positivized list, fulfilled a function analogous to that of an open exception clause, revealing that the positivization of the indicia does not close the system, since it always admits unforeseen hypotheses that operate as competing explanations.

The joint reading of the four rulings authorizes two findings. The first is that two modalities of evidentiary insufficiency are distinguished: a quantitative one (as in Nerópolis, due to the absence of positive elements evidencing the distortion) and a qualitative one, as in Goianira, due to the existence of an alternative explanation for the same elements. The second, more profound, is that the determining variable is not the norm, but the quality of the inferential construction: the positivization of the criteria conferred certainty as to the admissible elements, but did not reduce the zones of indeterminacy.

In all cases, the application of the principle *in dubio pro suffragio* operated as a mechanism for the resolution of uncertainty, resolving the doubt in favour of the preservation

of the electoral result. The problem of gender quota fraud, on the evidentiary plane, is not one of a catalogue of indicia, but of articulation among them; fraud is not defined by the presence of certain elements, but by the manner in which those elements are articulated, so that the decisive distinction operates between evidentiary convergence and ambiguity, and not between the presence and absence of evidence.

The stability of the criteria affirmed by the TRE-GO, added to the variability of the results, does not represent inconsistency. On the contrary, it expresses the judge's fidelity to the model of individualized analysis, in consonance with the duty of uniformization, stability, integrity and coherence of jurisprudence (Article 926 of the Code of Civil Procedure).

Decisional divergence, seen from this angle, is a datum of coherence, and not of incoherence, of the evidentiary system: it confirms that gender quota fraud is, in the final analysis, an inferential construction dependent on the judicial evaluation of the evidence, and that the institutionally adequate response does not consist in the rigid standardization of criteria, but in the qualification of the reasoning that articulates the indicia.

The observation of the rulings allows the systematization of the structural evidentiary challenges that cross the matter. The first is the predominance of circumstantial evidence: none of the cases presents direct evidence of collusion or deliberate simulation, the imputation being structured from accountability, electoral results and the absence of campaign records, interpreted in light of the circumstances.

The second is the centrality of the proof of a negative fact: fraud is frequently constructed as an omission, the non-performance of a campaign, the non-obtaining of votes, the non-existence of relevant financial movement, which shifts the centre of the evidence to the absence of expected behaviour and raises the delicate question of knowing when the absence of a datum can validly sustain the inference of an illicit act. The third is the presence of implicit presumptions: in certain decisional arrangements, the absence of expected electoral behaviour brings the reasoning close to a logic of reversal of the burden of proof, which the requirement of robust and convergent evidence seeks to contain.

The fourth is the structural ambiguity of the indicia: unexpressive voting, low movement and limited campaign are not, in themselves, univocal indicators of fraud, admitting alternative explanations (unviable candidacy, tacit withdrawal, fragility shared by the list) which, when plausible, prevent the stabilization of the fraudulent inference.

These challenges are neither contingent nor arise from specific failures in the conduct of the proceedings; they reveal structural limitations of the normative and jurisprudential model itself. The combination of open normative concepts, predominantly circumstantial evidence and material inequalities that affect the competitiveness of female candidacies

necessarily produces zones of indeterminacy in the evidentiary standard. The absence of objective criteria to distinguish fictitious candidacies from low-competitiveness candidacies confers upon the judge a wide margin of evaluation, which may result in divergent decisions even in factually similar situations.

The central challenge, therefore, lies not only in identifying fraud, but in defining the criteria by which it may be validly recognized, and it is at this point that the contribution of the study is inserted: by evidencing the variability of the evidentiary standard, it is demonstrated that the consolidation of jurisprudence depends not only on the setting of abstract parameters, but on the construction of more precise criteria of evaluation of the evidence, capable of reducing uncertainty and conferring greater predictability on decisions.

The picture that emerges from the regional observation is, therefore, that of an evidentiary standard under construction. The combined application of enunciado nº 73 and of Resolution nº 23.735/2024 did not eliminate the need for critical judgment on the evidence; on the contrary, it reinforced the centrality of the judge's interpretive activity. The manner in which the inference is carried out (more or less demanding, more or less open) determines the outcome of the proceeding, evidencing that the problem does not reside in the normative definition of fraud, but in its demonstration.

Hence the thesis that articulates the entire work and responds directly to the title: the evidentiary challenges in the characterization of gender quota fraud are structural, and their overcoming does not pass through the rigid standardization of criteria, incompatible with the nature of the phenomenon, but through the qualification of the inferential path that leads from the indicia to the conclusion, the only path methodologically compatible with the complexity of the object and with the requirements of a procedurally just decision.

5 EVIDENCE, DECISION AND DEMOCRATIC TENSION: FRAUD AS AN INFERENTIAL ILLICIT ACT

The findings shift the problem to the plane of the theory of evidence. Gender quota fraud is not a fact that is discovered, but a meaning that is constructed: it is in the articulation among indicia, inferences and decisions that its legal existence is defined. The decision does not derive automatically from the facts, but from the manner in which these are organized, interpreted and integrated into a legally justifiable narrative, a domain in which the distinction between fact and interpretation becomes particularly tenuous, requiring argumentative rigour and methodological control of the inferences (Taruffo).

Fraud is thus situated in a zone of intersection between law and epistemology, in which the sufficiency of the evidence depends not only on its existence, but on its capacity to sustain

a stable and convergent inference. This finding dialogues with the warning that the uncritical transposition of the notion of fraud against the law to the electoral field may produce excessively open categories, capable of encompassing situations that correspond not to fraudulent practices, but to manifestations of structural fragility of the candidacies (Andrade Neto; Gresta; Santos, 2018).

The use of circumstantial evidence requires not only the identification of the facts, but the making explicit of the reasons why these facts are considered sufficient to sustain the adopted conclusion. The absence of this making explicit compromises the transparency and controllability of the decision, transferring to the inner forum of the judge an operation that should be intersubjectively verifiable. It is precisely at this point that the problem of gender quota fraud approaches the contemporary discussions of the theory of evidence: the judgment of sufficiency is not given, but constructed, and its legitimacy depends on the quality of the justification that accompanies it.

Uncertainty, in a normative environment structured by open clauses, is not eliminated, but managed, and the judge acts as an operator of reduction of this uncertainty, whose decision not only applies the norm, but constructs the very object of the judgment from the available evidence. Decisional variability must therefore be interpreted not as inconsistency, but as an expression of the epistemic limits of circumstantial evidence.

The structural difficulty of producing proof of a negative fact requires caution in the distribution of the burden of proof. The construction of fraud from the absence of behaviour (non-performance of a campaign, non-obtaining of votes, non-existence of relevant financial movement) tends to implicitly shift the burden to the investigated candidate, urged to demonstrate the authenticity of her own participation (Costa, 2025). By requiring from the candidates the reiterated proof of their political legitimacy, the system may institute a more rigorous validation standard for women than for men, configuring what is here termed, in analytical terms, *gender procedural violence*.

This is not a rhetorical judgment, but a conceptual instrument intended to illuminate the symbolic and material dimension of the disproportionate argumentative burden that falls upon female candidates in quota fraud actions, reproducing, on the jurisdictional plane, the same asymmetries that the quota policy seeks to overcome. The category does not exhaust the theme, but offers a useful reading key for future empirical research on the distribution of the burden of proof and the differentiated procedural treatment of male and female candidacies of low competitiveness.

This dynamic requires distinguishing, with clarity, two planes frequently confused in decisional practice. One is that of the electoral unviability of the candidacy (a material

phenomenon, linked to the adverse conditions of competition that structurally characterize female participation; the other is that of fraudulent simulation) an intentional phenomenon, linked to the finalistic distortion of the norm. The weakened candidacy is not, in itself, a fictitious candidacy: to confuse them means to punish fragility as if it were fraud, transferring to the jurisdictional plane precisely the inequalities that affirmative action intends to correct.

The requirement of robust and convergent evidence functions, in this sense, as an epistemological filter that prevents the inference of fraud from indicia of low explanatory density, protecting the authentic candidate without, however, legitimizing the merely formal candidacy instrumentalized by the party. The balance between these two poles (protection of affirmative action against its capture and protection of candidates against procedural re-victimization) constitutes the core of the democratic tension that the evidentiary challenge encloses.

The tension between the repression of fraud and the protection of female participation manifests itself in a sensitive way in the extent of the sanctions. The model of expanded accountability inaugurated in Valença/PI, by admitting the revocation of the entire slate regardless of the demonstration of direct participation of each candidate, may create tension with due process of law and with the principle of subjective responsibility, above all when it reaches female candidacies that did not participate in the fraud (Cunha; Bastos Junior, 2020).

The effectiveness of gender policy depends not only on the intensity of repression, but on the quality of the evidentiary standard that sustains it: the requirement of robust evidence cannot be understood as a rhetorical formula, but as an operative criterion that imposes upon the judge the duty to rigorously justify the sufficiency of the indicia.

This requirement connects the matter to the contemporary debate on sanctioning electoral law. The AIJE being an action of a sanctioning nature, whose consequences reach fundamental rights of political participation, the evidentiary standard that informs it cannot be equated with that of the mere preponderance of evidence, proper to ordinary civil procedure, but must approach a higher level of conviction, compatible with the gravity of the effects.

It is not a matter of uncritically importing the criminal standard of proof beyond reasonable doubt, inadequate to the circumstantial dynamics of structural illicit acts, but of recognizing that quota fraud is situated at an intermediate point, in which the required robustness grows in proportion to the severity of the sanction. Robust and convergent evidence functions, in this register, as the operational translation of this intermediate requirement: neither the absolute certainty, which would render affirmative action unfeasible, nor the mere plausibility, which would convert it into an instrument of persecution. The

evidentiary challenge is, in essence, the challenge of calibrating this level, a task that admits no abstract solution, but only argumentative construction case by case.

In the face of this picture, a three-axis interpretive model is proposed, aimed at the rationalization of jurisdictional activity without suppression of the complexity of the phenomenon. The first is qualified evidentiary convergence, which rejects decisions based on isolated indicia or those of low explanatory density. The second is the centrality of individualized analysis of candidacies, a technique of restraint of generalizations and stereotypes that protects both authentic candidates, preventing real campaigns from being confused with artificial arrangements, and the very purpose of affirmative action, preventing the legitimization of merely formal candidacies.

The third is rigour in making explicit the inferential path adopted by the judge, a condition of argumentative transparency and of control of the decision: it is not enough to enumerate the indicia, the demonstration of the interpretive path that confers upon them convergence and meaning is required. These parameters do not eliminate the uncertainty inherent in the phenomenon, but allow its rational management.

From this arises a practical implication for the institutional design of oversight: if the inferential structure of the evidence is the critical point, and not the catalogue of indicia, any future regulatory improvement should concentrate less on the expansion of circumstantial elements and more on the construction of parameters of articulation among them, analytical protocols, inferential standards and mechanisms of reinforced motivation of the decision. It is, in the final analysis, a matter of moving the regulatory focus from the plane of the indicia to the plane of the inference: from what is admitted as an element of evidence to how these elements should be articulated in a judgment of sufficiency.

The proposed model does not intend to close the system, but to qualify it: it recognizes that gender quota fraud will continue to challenge the legal system, precisely because it is situated in a zone of intersection between law, politics and social reality, and that what is required is not the construction of rigid criteria, but the development of a decisional practice capable of dealing with complexity without reducing it, preserving at the same time the integrity of the electoral process and the inclusive purpose of gender policy.

On the theoretical plane here developed, it can be affirmed that gender quota fraud is not a fact that is discovered, but a meaning that is constructed. It is in the articulation among indicia, inferences and decisions that its legal existence is defined, and it is in this same space that, in the final instance, not only the validity of specific candidacies but the effective reach of a public policy aimed at the transformation of the structures of power is decided. The judicial decision, in this domain, is never mere subsumption: it reconstructs the object it judges.

To recognize this nature does not weaken the control of rationality; on the contrary, it makes it possible, by making explicit that the legitimacy of the decision rests not on the illusion of a self-evident truth extracted from the case records, but on the demonstrable quality of the inferential path that leads from the indicia to the conclusion. It is this requirement of explicit inferential grounding that converts apparent discretion into controllable argumentative responsibility, a condition without which the repression of fraud and the protection of female participation cannot coexist in a democratically legitimate manner (Streck, 2011).

The three contributions proposed in this study articulate themselves, finally, into a unity. The understanding of fraud as an inferential illicit act is the diagnosis; the category of gender procedural violence is the critical warning about the risks of this diagnosis when applied without sensitivity to structural asymmetries; and the three-axis model is the propositive response that seeks to reconcile the effective repression of fraud with the protection of authentic candidacies.

None of the three in isolation exhausts the problem, but, taken together, they offer to the electoral judiciary and to legal scholarship a methodological repertoire capable of guiding the decision without reducing the phenomenon to closed formulas, a repertoire that recognizes, with realism, that uncertainty is constitutive of the object and that the task of the law is not to eliminate it, but to manage it in a transparent, controllable and procedurally just manner.

It is fitting, finally, to situate the broader democratic significance of this discussion. The manner in which the Electoral Justice resolves the evidentiary challenge of gender quota fraud is not a merely technical question: it defines, in practice, the effective reach of a public policy conceived to alter the historical structures of exclusion. An excessively permissive evidentiary standard exposes authentic female candidacies to the risk of revocation, re-victimizing women who faced, with scarce resources, the structural adversities of the contest, and producing the perverse effect of discouraging future female participation.

An excessively rigid standard, in turn, shields the practices of simulation and converts affirmative action into an empty formality. Between these two extremes, the judicial decision operates as an instance of mediation, and the quality of this mediation depends, in the final analysis, on the inferential rationality that sustains it. Evidence, in this domain, is not merely an instrument of reconstruction of the facts: it is the place where the destiny of a constitutional promise of substantive equality is decided.

6 FINAL CONSIDERATIONS

To the guiding question, the investigation responds that the evidentiary challenges in ascertaining gender quota fraud are not contingent phenomena, but the structural result of the combination of open normative concepts, predominantly circumstantial evidence and material inequalities that affect women's political participation. These factors, articulated, prevent the consolidation of standardized criteria and render the individualized analysis of candidacies not merely convenient, but a requirement of decisional rationality.

The central hypothesis was confirmed: what differentiates a favourable outcome from an unfavourable one, in cases with structurally similar indicia, is not the isolated presence of unexpressive voting, absence of a campaign or standardized accounts, but the manner in which these elements converge (or fail to converge) into a coherent and robust inferential narrative.

The research offers three contributions. On the conceptual plane, it argues that gender quota fraud is, in a strict legal sense, an illicit act of an inferential nature, whose proof is not realized by the presentation of direct evidence, but by the articulation of indicia into an evidentiary structure whose quality depends decisively on the reasoning mobilized by the judge, so that the control of the rationality of the decision requires explicit inferential grounding. On the critical plane, it proposes the analytical category of gender procedural violence as a reading key for the disproportionate argumentative burden imposed upon female candidates.

On the propositive plane, it presents the three-axis model (qualified evidentiary convergence, centrality of individualized analysis and rigour in making explicit the inferential path) as a methodological repertoire capable of guiding decisions without reducing the phenomenon to closed formulas. It should also be noted a dogmatic dimension of increasing reach: jurisprudence, in dialogue with Law n° 14.192/2021, has been consolidating the understanding that the instrumentalized candidate does not figure as the author of the fraud, but as a victim of gender political violence, a conception that tends to influence future decisional parameters.

The limitations of the scope are recorded: the spatial circumscription to the TRE-GO and the temporal one to 2022–2025, as well as the choice to observe rulings in depth to the detriment of the sample extent, restrict the generalization of the conclusions to other courts and normative frameworks. The methodological design (observation of rulings as a technique of documentary research, and not a case study in the technical sense) privileged interpretive depth, an appropriate choice for the object, but which must be made explicit as an epistemological choice.

Moreover, the academic perspective adopted is not to be confused with any judgment of correctness on the decisions examined, although the institutional position of the researcher in the period demanded permanent epistemological vigilance.

Various fronts of investigation open up from the findings. In the first place, comparative empirical studies involving different Regional Courts could test the hypothesis that the semantic openness of the evidentiary standard produces structural, and not merely conjunctural, decisional dispersion. In the second place, quantitative research on the distribution of the argumentative burden between male and female candidacies (examining, for example, the frequency with which the positive proof of campaign acts is required from the female candidate) could assess, in verifiable terms, the hypothesis of gender procedural violence.

In the third place, it is desirable to deepen the discussion on the limits of the extension of sanctions to candidates not directly involved in the fraudulent practice, in dialogue with the principle of subjective responsibility and with the contemporary debates on sanctioning electoral law. Finally, space opens up for investigations into the role of the internal instances of parties and federations in the selection of and effective support for female candidacies, in a key that articulates electoral law, political science and democratic theory.

The Electoral Justice exercises, in this field, a function of mediation between substantive equality, popular sovereignty and legal certainty. Its action cannot be reduced to the mechanical application of norms, requiring permanent interpretive reconstruction, in which evidence assumes a central and decisive role. The effectiveness of the gender quota policy depends not only on the intensity of the repression of fraud, but, perhaps above all, on the quality of the evidentiary standard that sustains it: to identify fraud is necessary; to identify it in a procedurally just manner is a condition of democratic legitimacy.

It is in this balance, demanding and permanent, that the evidentiary challenge resides that this article has sought to understand and, to the extent possible, contribute to rationalizing.

ABSTRACT

Contemporary technological advancement has reignited the strategic debate on the transformation of war. The theses of the Revolution in Military Affairs (RMA) and Network-Centric Warfare (NCW), updated by the contemporary promise of Artificial Intelligence (AI), postulated the reduction of Clausewitzian friction and the “fog of war” through automation and data superiority. This theoretical essay investigates how technological modernity alters war and national strategies in the near future, defending the hypothesis that technology does not eliminate friction but reconfigures it. A qualitative approach is adopted, grounded in an exploratory case study on the military modernization of the Russian Federation, focusing on the State Armament Program (GPV 2020) and its performance in the War in Ukraine. The triangulation between classical and contemporary theoretical frameworks and empirical evidence demonstrates that sensor saturation generated a transparent battlefield that contributed to a return to high-friction positional warfare. This dynamic transferred the weight of tactical friction to the Defense Industrial Base (DIB) and logistics, subordinating the state to an emerging civilian “Military-Technological Complex.” As compensation for this attrition, major powers began to orchestrate other types of action to reduce the logistical burden. It is concluded that, in the 21st century, strategic advantage tends not to reside merely in automation, but in the state's capacity to govern friction in its logistical rear, integrate civil-military innovation, and dominate the informational environment amid the uncertainty of combat.

Keywords: Strategy. Friction. Defense Industrial Base. Military-Technological Complex. War in Ukraine.

RESUMO

O avanço tecnológico contemporâneo reacendeu o debate estratégico sobre a transformação da guerra. As teses da Revolução nos Assuntos Militares (RMA), da Guerra Centrada em Redes (NCW), atualizadas pela promessa contemporânea da Inteligência Artificial (IA), postularam a redução da fricção clausewitziana e do “nevoeiro da guerra” por meio da automação e da superioridade de dados. Contudo, este ensaio teórico investiga como a modernidade tecnológica altera a guerra e as estratégias nacionais no futuro próximo, defendendo a hipótese de que a tecnologia não elimina a fricção, mas a reconfigura. Adota-se uma abordagem qualitativa fundamentada em um estudo de caso exploratório sobre a modernização militar da Federação Russa, com o foco no Programa Estatal de

Armamento (GPV 2020) e sua atuação na Guerra na Ucrânia. A triangulação entre o referencial teórico clássico e contemporâneo e as evidências empíricas demonstra que a saturação de sensores gerou um campo de batalha transparente que contribuiu para o retorno à guerra posicional de alta fricção. Essa dinâmica transferiu o peso da fricção tática para a Base Industrial de Defesa (BID) e para a logística, subordinando o Estado a um emergente “Complexo Militar-Tecnológico” civil. Como compensação a esse desgaste, as potências passaram a orquestrar outros tipos de ação para diminuir a carga logística. Conclui-se que, no século XXI, a vantagem estratégica tende a não residir apenas na mera automação, mas na capacidade estatal de governar a fricção em sua retaguarda logística, integrar a inovação civil-militar e dominar o ambiente informacional perante a incerteza do combate.

1 INTRODUCTION

Understanding war in the 21st century requires a rigorous theoretical framework, capable of analysing the evolution of strategic thought in the face of the allure of technological promises (Duarte, 2012). Carl von Clausewitz's theory of war remains central to this analysis, above all through his concept of friction, conceived as the fundamental element that distinguishes real war from war idealised on paper (Clausewitz, 2010). Friction encompasses uncertainty, danger, physical effort, intelligence failures and chance, forming the “fog of war” that challenges the reasoning and action of commanders on the battlefield (Clausewitz, 2010; Tavares; Ramos; Franchi, 2018).

From the 1990s onwards, the rise of the Revolution in Military Affairs (RMA) and of Network-Centric Warfare (NCW) spread the theoretical belief that technology could reduce or even eliminate this structural friction (Owens; Offley, 2000). Theorists such as Cebrowski and Garstka postulated that data fusion and network interconnection would create a situational awareness capable of guaranteeing the self-synchronisation of forces and an unrivalled speed of command (Cebrowski; Garstka, 1998). From this perspective, a “system of systems” of Command, Control, Communications, Computing and Intelligence would allow commanders to dispel the traditional fog of war (Owens; Offley, 2000). For the theorists of this strand, technological modernity would have the potential to transform combat into an essentially predictable engineering exercise, conducted from the top down (Knox; Murray, 2001).

In contemporary literature, this utopian expectation evolved from the digitisation of networks to the promise of Artificial Intelligence (AI) and full automation. It is believed, in some strategic circles, that autonomous systems could partially or entirely replace human cognitive and emotional limitations in combat (King, 2025). However, authors such as Anthony King argue that AI acts primarily as a probabilistic tool for processing large volumes of data. The efficient operation of these complex systems has been producing the rise of a new “Military-Technological Complex”, inserting civilian technology corporations directly into military operations and introducing new institutional variables into the strategies of the state (King, 2025). Critics of technological arrogance, hubris, warn that an exclusive focus on technology disregards the fact that war is an inherently human and non-linear phenomenon, subject to the clash of wills (Murray, 1997).

Within this context of theoretical confrontation between the promises of the digital age and the immutability of the nature of war, the central question of this essay arises: how can technological modernity change war and national strategies in the near future?

The hypothesis to be investigated in this work is that technology, rather than altering the fundamental nature of war or eliminating friction, acts by reconfiguring political options and national strategies. It is postulated that the friction of war tends to shift from the tactical front line to the cognitive dimension of decision-makers and, above all, to the logistical-industrial capacity of the state and its integration with the civilian sector (Amarante, 2012; King, 2025).

Methodologically, the research adopts a qualitative approach operationalised through an exploratory case study. In the following sections, after the review of the theoretical framework, the modernisation of the Russian Defence Industrial Complex, the logistical burden evidenced in the war in Ukraine and the strategic compensations adopted through hybrid and multi-domain actions will be analysed. In this way, the aim is to test the applicability of the concept of friction in direct counterpoint to the promises of automation and of the Revolution in Military Affairs (RMA), demonstrating the shift of the friction of war from the front line to the industrial and institutional rear of the state, further reaching the cognitive dimension of decision-makers.

Still with regard to the methodological path, in observance of the guidelines of academic integrity and transparency in scientific research, the authors declare the use of an Artificial Intelligence tool, based on a Large Language Model, as an auxiliary resource in the elaboration of this essay. Claude (Anthropic, version Opus 4.8) was used to verify the correctness of the writing, the translation of the abstract into English and Spanish, and the adequacy of the formatting to the standards of the Associação Brasileira de Normas Técnicas (ABNT). It should be emphasised that the formulation of the research problem, the design of the hypothesis, the selection of the literature, the empirical analysis and the final considerations are of the exclusive authorship and responsibility of the researchers, who wrote, reviewed and edited the content in its entirety, preserving the intellectual reflection presented.

2 THE THEORETICAL DEBATE: THE TECHNOLOGICAL UTOPIA AND THE NATURE OF FRICTION

The rise of information technologies drove a profound theoretical debate on the possibility of taming the unpredictable nature of combat through superiority in data processing (Elward, 2010). The theory of Network-Centric Warfare (NCW), introduced by thinkers such as Cebrowski and Garstka, argues that the uninterrupted interconnection of sensors and shooters generates a self-synchronisation capable of surpassing the adversary's decision cycle, translating information superiority into competitive advantage and accelerating the

pace of operations (Cebrowski; Garstka, 1998). For the advocates of this technological revolution, the application of advanced networks of Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance (C4ISR) would provide an omniscient view of the battlefield, proposing the substantial dissipation of the fog of war and of uncertainty at the strategic level (Owens; Offley, 2000).

However, a significant part of the strategic literature opposes this utopian vision, drawing on the foundations of Clausewitz's theory (Murray, 1997). For the critical strand, war remains an inherently non-linear phenomenon, characterised by the paradoxical trinity and inseparably linked to chance and primordial violence (Clausewitz, 2010; Knox; Murray, 2001). Williamson Murray classifies as “technological arrogance”, hubris, the attempt to replace the political and human understanding of war with quantitative fascination with sensors and computers (Murray, 1997). Along these same lines, it is argued that the premise of absolute informational dominance ignores the realities of human nature and the capacity of opponents to adopt asymmetric measures that establish chaos (Elward, 2010).

Artificial Intelligence (AI) and automation, at the current stage of this debate, have assumed the centre of the discussions on the possible reduction of military friction (King, 2025). Enthusiasts of this evolution suggest that algorithms could free decision-making from the inhibitions, frailties and fear characteristic of human psychology (King, 2025). However, King points out that current AI acts fundamentally as a statistical engine for the treatment of Big Data with a focus on tasks such as planning, engagement and cyber actions, always requiring human control and parameters (King, 2025). It is theorised that the adoption of these technologies does not automate strategy independently, but subordinates the Armed Forces to a complex arrangement in which data engineers and the civilian technological infrastructure integrate the operational headquarters, redefining the 20th-century Western model (King, 2025).

In order to understand the exact impact of these technological dynamics on the combatant, researchers have updated the taxonomy of the friction of war. Tavares, Ramos and Franchi (2018), supported by the studies of Barry Watts and the complementary theory of Malkki and Malkki, propose that modern friction acts directly on the cognitive and emotional dimensions of military personnel. It was found that the gigantic volume and speed of the information gathered by digitisation may, in fact, overload the decision-making process (Elward, 2010). The danger of death, the imperfection in the curation of data and the adverse conditions trigger the same mechanisms of psychological self-preservation that restrict the flexibility of the leadership's reasoning, limiting its efficiency regardless of the technology embedded in operations (Tavares; Ramos; Franchi, 2018).

This confrontation, between the North American technocentric premise of the elimination of the fog and the theory that attests to the reconfiguration of friction in the cognitive and institutional-rear spheres, makes it imperative to analyse how these dynamics effectively manifest themselves in the combat zones of the 21st century. Verifying which theories are validated requires the observation of the empirical phenomenon of war, encompassing the industrial imperatives, the networked logistics and the stress test of disruptive armaments, themes that structure the analysis that follows.

3 THE LOGISTICAL BURDEN AND THE RESTRUCTURING OF THE DEFENCE INDUSTRIAL BASE

As states seek to overcome friction on the tactical battlefield through digitisation and precision weapons, they insert a new and substantial layer of friction into the material dimension: logistical friction. As Amarante (2012) elucidates, the incorporation of modern technological combat functions into integrated systems creates apparatuses of very high cost and complexity. As a result, the logistical weight of operations grows exponentially, demanding from the state extensive prior political and productive preparation (Duarte, 2012). Technological advancement thus requires that strategic advantage come to depend critically on the uninterrupted mobilisation of the Defence Industrial Base (DIB).

The empirical application of this logistical-institutional imperative is revealed paradigmatically in the trajectory of the Russian Federation in the 21st century. The operational deficiencies exposed during the War in Georgia (2008) made clear to Moscow that the adoption of modern tactics clashed with the structural obsolescence of its productive base, triggering the need for a profound Military Reform (Grass, 2022). The main milestone of this turning point was the announcement, in 2010, of the State Armament Program (GPV 2020), which initially allocated around 600 billion dollars to the development of new technologies and war materiel over the course of a decade (Oliveira, 2024).

In order to absorb this volume of investments and attempt to mitigate the logistical friction of modernisation, Russian state planning promoted a radical verticalisation of the management of its Defence Industrial Complex. The government created state-owned mega-corporations, holdings, most notably Rostec, created in 2007, which came to encompass hundreds of high-technology organisations and industries. The objective of this manoeuvre was to concentrate research, development and production resources in order to avoid duplication of efforts and to optimise the delivery of the material means required by the Armed Forces (Grass, 2022).

One of the most notable examples of this institutional adaptation to the costs of modern war was the prioritisation of the Iskander Tactical Ballistic Missile System (SMBT) within the scope of the GPV. The choice to develop and modernise the Iskander, in its M version, equipped with optical matching and anti-missile decoys, reflects a decision strictly based on cost-benefit. The employment of high-precision tactical ballistic missiles was considered a more economical and logistically efficient alternative to replace the costly and vulnerable conventional close air attacks (Oliveira, 2024).

However, the attempt to achieve technological autarky and to isolate the Russian DIB from the friction imposed by the international system proved to be an illusion. With the Western sanctions applied after the annexation of Crimea (2014) and toughened in 2018, Russia attempted to implement an import substitution policy (Oliveira, 2024). The report of the Center for Naval Analyses (CNA) demonstrates that this policy failed to provide Russia with independence, since the production of advanced systems, such as the precision missiles themselves, remained dependent on Western machine tools and microprocessors (Gorenburg *et al.*, 2024). To sustain the war effort from 2022 onwards, the Russian state was forced to govern this industrial friction by resorting to parallel imports and external cooperation, the supply of drones and munitions by allied countries, demonstrating that modern military power is hostage to the global supply chains (Gorenburg *et al.*, 2024).

It is at the intersection between this industrial burden and the conduct of operations that the materialisation of the change in national strategies is observed. Refuting the technocentric thesis of rapid victories, the Russian military strategy in the invasion of Ukraine in 2022 was rigidly circumscribed by its logistical limitations. The deep dependence of the Russian land forces on the railway network for the supply of massive volumes of munitions, combined with the scarcity of truck transport over long distances, limited the range of action and the pace of advance of the troops (Diniz, 2025).

Faced with this material friction, and with the proliferation of sensors and drones that made the battlefield transparent (Ferreira, 2025), the intended war of movement failed. Russia was forced to align its strategy with the logistical imperatives, adopting the doctrine of “Active Defence”, based on systematic bombardments and on a positional war of attrition (Diniz, 2025; Ferreira, 2025). Technology, when disconnected from a resilient logistical and productive capacity, acts as a severe operational limiter. It is precisely in order to attempt to circumvent this material attrition and break the paralysis imposed by positional friction that the major powers begin to seek compensations in other spheres of the conflict, orchestrating other types of multi-domain strategies.

4 MULTI-DOMAIN INTEGRATION AND HYBRID ACTIONS AS STRATEGIC COMPENSATION

The finding that technological parity and sensor saturation generated a transparent battlefield made unfeasible the fluidity of the large concentrations of armoured troops (Ferreira, 2025). Faced with this transparency and with the severe logistical burden required to sustain the war of attrition, contemporary powers found themselves obliged to seek strategic alternatives to circumvent direct and exhausting kinetic engagement. The solution found to compensate for industrial limitations and break the positional paralysis was the orchestration of hybrid strategies and multi-domain actions, with the aim of transferring friction to the adversary's decision-making process and infrastructure.

In Russian military thought, the search for compensations materialised in the adoption of flexible operational concepts, frequently encompassed in the West under the nomenclature of Hybrid Warfare. This definition is conceptually imprecise for the Russian school, which adopts the terminology of “New Generation Warfare”, a formulation of its own for achieving political objectives through the combined use of asymmetric actions and low-intensity conflicts (Giles, 2020). In the Western debate, this change in the Russian posture was erroneously popularised under the label of the “Gerasimov Doctrine”. The expression, coined in 2014 by the researcher Mark Galeotti, became a distorted paradigm and forced the author himself to publicly retract for having created this term that does not exist in the formality of Moscow's manuals (Giles, 2020; Volpe, 2024).

The genesis of this international misunderstanding dates back to an article published in February 2013 in the newspaper *Courier Industriel Militaire* by the Russian Chief of the General Staff, Valery Gerasimov. In his text, the general did not formulate a new aggressive doctrine, but rather analysed and criticised the regime-change tactics used by the Western countries during the Arab Spring, in Libya and Syria (Giles, 2020; Plekhanov, 2021). Gerasimov warned that, in the 21st century, the border between the states of war and peace had become blurred, and that the orchestrated use of political, economic and informational measures frequently surpassed the effectiveness of the force of conventional arms (Giles, 2020; Plekhanov, 2021).

Far from being a revolutionary and sudden invention of Gerasimov, this approach recovers classical theories of the Russian school, adapting them to the digital age. Ideas such as “Rebellion Warfare”, *Myatezh Voina*, theorised in the 1950s and 1960s by the exiled colonel and professor Evgeny Messner, already conceived a conflict waged primarily in the psychological dimension, aiming at the fission of the psyche and the moral incapacitation of the adversary (Klus, 2016). The concept advocates the employment of irregular forces, terrorism and civil agitation orchestrated under a highly ambiguous strategic design, with the

aim of confusing the victim's perception, relegating the regular Armed Forces to a merely auxiliary role (Klus, 2016). In absorbing this heritage, contemporary Russian military strategy advocates that non-military actions, political, economic, informational and cyber, must act in conjunction with conventional military power, with a significantly greater relative weight, illustrated by Lopes (2021) in an approximate proportion of four non-military measures for each strictly military action.

The central axis that consolidates this hybrid strategy and makes viable the manipulation of the enemy's fog of war lies in the intensive employment of the theory of Reflexive Control. Developed historically within Soviet military doctrine by Vladimir Lefebvre, Reflexive Control is defined as the process by which one of the opponents transmits the motives and grounds for the decision-making of its adversary, voluntarily inducing it to adopt an action favourable to the initiator of the control (Lopes, 2021).

By applying Reflexive Control combining deception, maskirovka, demonstrations of force, social media, cyberattacks and the employment of proxy forces, such as militias and private military companies, the attacker achieves operational results projecting power with a significantly lower logistical demand. The objective ceases to be total physical annihilation, typical of industrial war, and becomes the induction of paralysis, exhaustion and the perception of despair in the opposing political and military leaderships (Lopes, 2021). Technological modernity offers new cyber and mass-communication tools so that the state may reconfigure the attrition, inserting conflicting and false data that affect the cognitive and emotional dimensions of the adversary's decision-makers.

The materialisation of this theory on the contemporary battlefield in Ukraine has revealed the inseparable convergence between land operations and the Cyber, Electronic and Space domains. According to Pinto (2025), Electronic Warfare (EW) has become an intrinsic part of the manoeuvre, using tactics of frequency blocking, jamming, and the sending of false signals, spoofing, to neutralise the opponent's drone constellations and guided artillery. Simultaneously, the offensives in cyberspace target critical civilian and military infrastructures, combining physical sabotage with psychological operations.

However, it is in the Space domain that the reconfiguration of national strategies, driven by what King (2025) called the Military-Technological Complex, shows itself most acutely. The war in Ukraine revealed the dependence of the contemporary Armed Forces on constellations of commercial satellites, such as Starlink, Maxar and Planet, to guarantee situational awareness, remote sensing and encrypted communications under heavy interference attack (Pinto, 2025; Teixeira Júnior; Santos; Gomes, 2025).

The combined employment of drones, missiles, electronic warfare and cyber intelligence acts in a complementary and multi-domain manner, requiring the state to drastically expand its coordination with the private technology sector. State actors pursue, within this tactical and strategic dynamic, a continuous effort of manipulation of the adversary's friction, preserving their own freedom of action in the face of the volatility of the globalised informational networks of the 21st century.

5 FINAL CONSIDERATIONS

The present theoretical essay sought to investigate how technological modernity may change war and national strategies in the near future, contrasting the technocentric premises of the Revolution in Military Affairs (RMA) with the enduring foundations of Clausewitz's strategic theory. Throughout the research, it was verified that the fascination with Network-Centric Warfare (NCW), postulated by authors such as Cebrowski and Garstka (1998) and Owens and Offley (2000), and with Artificial Intelligence generated the false expectation that data superiority could dissipate the fog of war and eliminate human friction from the battlefield.

The theoretical analysis, grounded in the studies of Murray (1997), Elward (2010), Tavares, Ramos and Franchi (2018) and of Anthony King (2025), demonstrated that technology does not suppress friction, but transforms and amplifies it. The informational excess inherent to digitisation imposes a heavy overload on the cognitive and emotional dimensions of decision-makers. Moreover, the complexity of modern weapons systems subordinates the Armed Forces to an emerging Military-Technological Complex, inserting civilian corporations and specialists directly into the Command and Control cycle, which creates new institutional variables and vulnerabilities.

Empirically, the examination of the modernisation of Russia's Defence Industry (Grass, 2022; Oliveira, 2024) and the evidence from the Russo-Ukrainian conflict corroborated the initial hypothesis of this study. The massive employment of sensors, drones and precision artillery generated a highly transparent battlefield, frustrating the attempts at fluid and rapid wars of movement (Teixeira Júnior; Santos; Gomes, 2025). Instead of making the conflict bloodless, technology imposed a return to positional war of high attrition (Ferreira, 2025). Strategic advantage fell upon the logistical burden. The success of operations became hostage to the capacity for uninterrupted mobilisation of the Defence Industrial Base (DIB) and to the limited railway and road supply chains (Diniz, 2025).

To compensate for the prohibitive cost of this material attrition, states began to orchestrate hybrid and multi-domain strategies. The employment of cyberspace, of electronic

warfare and of dual-use space infrastructure, civilian and military, acts in synergy with other strategies such as Russian Reflexive Control (Pinto, 2025; Lopes, 2021). This approach aims to transfer friction directly to the mind of the opposing leadership and to the enemy's critical infrastructure, prioritising moral and political exhaustion to the detriment of strictly physical annihilation (Klus, 2016; Volpe, 2024).

It is concluded, therefore, that technological modernity does not alter the fundamental and paradoxical nature of war, which continues to be a clash of human wills permeated by chance and violence. It reconfigures national strategies, shifting the centre of gravity of tactical manoeuvre from the front line to the state's capacity to govern friction in its rear. In the 21st century, victory will depend on the aptitude of the political and military leadership to integrate civil-military innovation, sustain the long-term logistical-industrial effort and dominate the informational environment in the face of the uncertainty of combat.

ABSTRACT

The increasing resistance of ticks to synthetic acaricides, together with concerns regarding their toxicological and environmental effects, has encouraged the search for plant-derived compounds with potential use in ectoparasite control. In this context, Cannabis sativa has emerged as a species of biotechnological interest due to its wide diversity of bioactive metabolites, including cannabinoids and terpenes. However, in addition to efficacy, the possible effects of plant extracts on non-target organisms must also be evaluated. Thus, the present study investigated the effects of spray exposure to C. sativa extract (2.5 mg/mL) on the histology and histochemistry of the uterus and heart of female Mus musculus mice. Fifteen Swiss females were distributed into three experimental groups: distilled water control, 30% ethanol (v/v) control, and treatment with C. sativa extract diluted in 30% ethanol. Exposures were carried out on three consecutive days and, after 14 days, the animals were euthanized for organ collection. Samples were processed for light microscopy after staining with hematoxylin-eosin and bromophenol blue. In the uterus, the treated group showed mild cytoplasmic vacuolization in glandular cells, more evident stromal vascular congestion, and vacuolated spaces between connective tissue cells, without evidence of hemorrhage,

necrosis, or extensive structural disorganization. In the heart, a focal increase in interfibrillar spaces and slight irregularity in myocardial fiber alignment were observed, with preservation of the overall tissue architecture. Bromophenol blue revealed a slight reduction in protein staining intensity in the treated group. Overall, exposure to *C. sativa* extract (2.5 mg/mL) was associated with mild morphological and histochemical alterations, without evidence of severe structural damage in the analyzed organs.

RESUMO

A crescente resistência dos carrapatos aos acaricidas sintéticos, associada às preocupações relacionadas aos seus efeitos toxicológicos e ambientais, tem incentivado a busca por compostos de origem vegetal com potencial aplicação no controle de ectoparasitas. Nesse contexto, *Cannabis sativa* tem se destacado como uma espécie de interesse biotecnológico devido à ampla diversidade de metabólitos bioativos, incluindo canabinoides e terpenos. No entanto, além da eficácia, os possíveis efeitos dos extratos vegetais sobre organismos não alvo também devem ser avaliados. Assim, o presente estudo investigou os efeitos da exposição, por pulverização, ao extrato de *C. sativa* (2,5 mg/mL) sobre a histologia e a histoquímica do útero e do coração de camundongos fêmeas *Mus musculus*. Quinze fêmeas Swiss foram distribuídas em três grupos experimentais: controle com água destilada, controle com etanol 30% (v/v) e tratamento com extrato de *C. sativa* diluído em etanol 30%. As exposições foram realizadas durante três dias consecutivos e, após 14 dias, os animais foram eutanasiados para a coleta dos órgãos. As amostras foram processadas para microscopia de luz e submetidas às colorações por hematoxilina-eosina e azul de bromofenol. No útero, o grupo tratado apresentou discreta vacuolização citoplasmática nas células glandulares, congestão vascular estromal mais evidente e espaços vacuolizados entre as células do tecido conjuntivo, sem evidências de hemorragia, necrose ou extensa desorganização estrutural. No coração, foram observados aumento focal dos espaços interfibrilares e discreta irregularidade no alinhamento das fibras miocárdicas, com preservação da arquitetura geral do tecido. A coloração por azul de bromofenol revelou discreta redução na intensidade da marcação proteica no grupo tratado. De modo geral, a exposição ao extrato de *C. sativa* (2,5 mg/mL) esteve associada a alterações morfológicas e histoquímicas discretas, sem evidências de danos estruturais graves nos órgãos analisados.

RESUMEN

La creciente resistencia de las garrapatas a los acaricidas sintéticos, junto con las preocupaciones sobre sus efectos toxicológicos y ambientales, ha fomentado la búsqueda de compuestos de origen vegetal con potencial uso en el control de ectoparásitos. En este contexto, *Cannabis sativa* ha surgido como una especie de interés biotecnológico debido a su amplia diversidad de metabolitos bioactivos, incluidos cannabinoides y terpenos. Sin embargo, además de la eficacia, también deben evaluarse los posibles efectos de los extractos vegetales en organismos no objetivo. Así, el presente estudio investigó los efectos de la exposición por pulverización al extracto de *C. sativa* (2,5 mg/mL) sobre la histología e histoquímica del útero y corazón de ratones hembra *Mus musculus*. Quince hembras Swiss se distribuyeron en tres grupos experimentales: control con agua destilada, control con etanol al 30% (v/v) y tratamiento con extracto de *C. sativa* diluido en etanol al 30%. Las exposiciones se realizaron durante tres días consecutivos y, después de 14 días, los animales fueron eutanasiados para la recolección de órganos. Las muestras se procesaron para microscopía óptica tras tinción con hematoxilina-eosina y azul de bromofenol. En el útero, el grupo tratado mostró leve vacuolización citoplasmática en células glandulares, congestión vascular estromal más evidente y espacios vacuolizados entre células del tejido conjuntivo, sin

evidencia de hemorragia, necrosis o extensa desorganización estructural. En el corazón, se observó un aumento focal de los espacios interfibrilares e irregularidad leve en la alineación de las fibras miocárdicas, con preservación de la arquitectura general del tejido. La tinción con azul de bromofenol reveló una ligera reducción en la intensidad de tinción de proteínas en el grupo tratado. En general, la exposición al extracto de *C. sativa* (2,5 mg/mL) se asoció con alteraciones morfológicas e histoquímicas leves, sin evidencia de daño estructural grave en los órganos analizados.

1 INTRODUCTION

Ticks are hematophagous arthropods of medical and veterinary importance, as they cause lesions in their hosts and act as vectors of pathogenic agents (Camargo-Mathias *et al.*, 2024; Nasreen *et al.*, 2020;). In recent decades, their geographic expansion has been favored by anthropogenic factors such as climate change, habitat fragmentation, and changes in host availability (Saleh *et al.*, 2021). The control of these ectoparasites has relied largely on the use of synthetic acaricides; however, the continuous use of these compounds has contributed to the selection of resistant populations, in addition to raising concerns regarding their potential toxicological and environmental impact (Obaid *et al.*, 2022; Shanmuganath *et al.*, 2021).

In this context, natural compounds of plant origin have received increasing attention as potentially safer and more sustainable alternatives for tick control (Wanzala, 2017). Among them, *Cannabis sativa* L. stands out because of its broad biological potential, mainly associated with the presence of cannabinoids and terpenes (Guerra *et al.*, 2023; Valizadehderakhshan *et al.*, 2021). Studies using extracts of this species in *Rhipicephalus linnaei* ticks have demonstrated effects on biological parameters and different tissues, including damage to tegumental and glandular structures, suggesting its potential as a natural acaricide (Camargo-Mathias *et al.*, 2024).

Despite these promising results, the proposal of new compounds for use in ectoparasite control requires, in addition to the demonstration of efficacy, the investigation of possible effects on non-target organisms. In this regard, the histological evaluation of host organs constitutes an important step in assessing the biological safety of exposure to the compound. Preclinical studies in rodents using *C. sativa* preparations reinforce the importance of investigating possible pharmacological and morphological effects in different organs, including tissues of the female reproductive system, thereby contributing to the biological safety assessment of these compounds (Araújo *et al.*, 2024; Lima *et al.*, 2021).

Among the organs of interest, the heart exhibits a highly specialized structural organization, composed of the endocardium, myocardium, and epicardium, whose integrity is essential for normal cardiac function (Leung; Zhou; Lui, 2016). Likewise, the uterus presents a well-defined histological organization, consisting of the endometrium, myometrium, and perimetrium, and is a relevant organ in the investigation of possible tissue alterations in females exposed to biologically active compounds (Al-Shaeli *et al.*, 2024; Roesler *et al.*, 2025). In addition to their morphofunctional relevance, the heart and uterus are tissues responsive to endocannabinoid signaling, which further emphasizes the importance of their

evaluation in studies of exposure to compounds derived from *C. sativa* (Paria; Dey, 2000; Pacher; Steffens, 2009).

Thus, considering the acaricidal potential of the *C. sativa* inflorescence extract and the need to investigate its safety in non-target organisms, the present study aimed to evaluate the effects of exposure to the extract, at a concentration of 2.5 mg/mL, on the histology and histochemistry of the heart and uterus of female *Mus musculus*.

2 MATERIALS AND METHODS

2.1 CANNABIS SATIVA EXTRACT

The crude extract of the *C. sativa* inflorescence was provided by the Associação Canábica Maria Flor, located in the city of Marília, São Paulo, Brazil, and produced under the technical supervision of Dr. Caroline Marroni Cremonez, Scientific Director of the Association. The phytochemical analysis was carried out by DALL Soluções Analíticas e Empresariais, located in Curitiba, Paraná, Brazil, and supervised by Dr. Gustavo Bertol, Technical Manager of the company, in partnership with the Associação Canábica Maria Flor.

The crude extract was diluted in a 30% ethanol solution (v/v), prepared in distilled water, in order to obtain the final concentration of 2.5 mg/mL, established based on previous studies conducted with ticks of the species *Rhipicephalus microplus* and *Rhipicephalus linnaei* (Camargo-Mathias, 2024; Nasreen *et al.*, 2020).

2.2 MUS MUSCULUS MICE

Fifteen healthy Swiss female mice of the species *Mus musculus*, weighing approximately 40 g and aged between 8 and 10 weeks, were obtained from the Center for Research and Animal Production (CPPA) of UNESP, Botucatu, São Paulo, Brazil. The animals were housed in the animal facility of the Institute of Biosciences (IB), in identified rectangular polypropylene cages (30 × 20 × 13 cm), with five animals per cage, under standard conditions of temperature (22°C ± 2°C), humidity (50%), appropriate ventilation, exhaust system, 12 h photoperiod, and were provided with food and water *ad libitum*.

2.3 EXPOSURE OF FEMALE MUS MUSCULUS MICE TO C. SATIVA EXTRACT BY SPRAYING

The 15 female *M. musculus* mice (5/group) were divided into the following groups:

- **Control Group 1 (CG1):** exposed to distilled water;
- **Control Group 2 (CG2):** exposed to 30% ethanol, the solvent used for the extract;
- **Treatment Group (T1):** exposed to the extract at a concentration of 2.5 mg/mL.

The exposures were carried out on three consecutive days, with 24 h intervals between them, using sterilized sprays, according to the protocol previously described by Cunha *et al.* (2017), simulating the application of commercial acaricides to host animals. The *Cannabis* extract was sprayed onto the dorsal region of the animals while protecting the head and preventing the compound from entering through other routes (nose, eyes, ears and mouth).

After exposure, the animals were observed daily for 14 days. On day 14, all animals were euthanized by overdose of anesthetic agents using ketamine hydrochloride (80 mg/kg BW/IP) and xylazine hydrochloride (20 mg/kg BW/IP), and the uterus and heart were collected. Organ removal procedures were performed by veterinarian Gabriel Correa de Camargo, CRMV No. 52730. Immediately after collection, these structures were fragmented and fixed in 4% paraformaldehyde.

All procedures were submitted to and approved by the Animal Ethics Committee (CEUA, Institute of Biosciences, UNESP – Rio Claro campus), under protocol No. 000549.

2.4 HISTOLOGICAL AND HISTOCHEMICAL ANALYSIS OF THE UTERUS AND HEART

The organs remained fixed in 4% paraformaldehyde for one week. After fixation, they were washed twice in 0.1 M sodium phosphate buffer. They were then dehydrated through an ascending ethanol series (70%, 80%, 90%, and 95%), with 20 min intervals at each concentration, and subsequently infiltrated with Leica Histoiresin® (Leica Biosystems, Nussloch, Germany) for seven days. After this period, the material was embedded in plastic molds containing resin and polymerizer and kept in an oven at 37°C for an additional seven days for polymerization.

The blocks were then sectioned using a LEICA RM2255® microtome (Leica Biosystems, Nussloch, Germany), obtaining sections 3 µm thick, which were collected on glass slides and stored in an oven for drying.

Part of the slides was subjected to hematoxylin-eosin (HE) staining. For this, the sections were hydrated in distilled water for 1 min, stained with hematoxylin (Sigma-Aldrich, St. Louis, MO, USA) for 10 min, and washed for 4 min in still water, followed by washing in running water. Next, they were stained with aqueous eosin (Sigma-Aldrich, St. Louis, MO, USA) for 5 min and again washed in running water. After drying at room temperature, the slides were mounted in permanent medium with Entellan® (Merck Millipore, Darmstadt, Germany). The permanent slides were analyzed and photodocumented under a Leica® DM750 bright-field microscope (Leica Microsystems, Wetzlar, Germany).

Another part of the slides was subjected to bromophenol blue staining (Sigma-Aldrich, St. Louis, MO, USA) for 1 h at room temperature. After staining, the slides were immersed in

0.5% acetic acid for 5 min and washed in running water for 15 min. They were then rapidly passed through tertiary butyl alcohol solution, air-dried, and mounted in permanent medium with Entellan® (Merck Millipore, Darmstadt, Germany). The permanent slides were analyzed and photodocumented under a Leica® DM750 bright-field microscope (Leica Microsystems, Wetzlar, Germany) at the Histology Laboratory of the Department of General and Applied Biology, IB/UNESP, Rio Claro, São Paulo, Brazil.

3 RESULTS

3.1 UTERUS

3.1.1 Hematoxylin and Eosin (HE) staining

The results obtained in the present study showed that, in the control group exposed to distilled water, the uterus exhibited preserved architecture/musculature (**Fig. 1A**). The endometrial glands displayed a well-defined tubular morphology and homogeneous distribution within the stroma (**Fig. 1A**), which showed uniform cellularity, with blood vessels of normal caliber and no evidence of blood congestion (**Fig. 1A**). In the myometrium, smooth muscle bundles were organized, with fibers arranged in parallel and elongated nuclei also preserved (**Fig. 1A**).

In the control group exposed to ethanol (30%), the uterine tissue was also found to be preserved (**Fig. 1B**). Mild blood congestion was observed in the stroma, characterized by the marked presence of erythrocytes, with no alteration in the associated connective tissue (**Fig. 1B**). Some glandular epithelial cells showed cytoplasmic vacuolization, without impairment of glandular organization (**Fig. 1B**). The myometrium remained organized (**Fig. 1B**).

In the group exposed to *Cannabis sativa* extract (2.5 mg/mL), mild morphological alterations were observed when compared with the control groups (**Fig. 1C**). The endometrial glands showed cells with cytoplasmic vacuolization (**Fig. 1C**). In the stroma, more evident blood congestion was observed compared with the control groups, but without signs of hemorrhage, necrosis, or cellular disorganization (**Fig. 1C**). The stroma also exhibited vacuole-like spaces between connective tissue cells (**Fig. 1C**). The myometrium remained organized, with no fragmentation or structural disarrangement (**Fig. 1C**).

3.1.2 Histochemistry (Bromophenol Blue)

In the water control group, bromophenol blue staining demonstrated homogeneous and intense protein labeling in the glandular cells and stroma, indicating a uniform pattern of total proteins (**Fig. 1D**).

In the ethanol control group, the staining intensity remained relatively homogeneous, with slight variation in intensity in glandular areas (**Fig. 1E**).

In the group treated with *C. sativa* (2.5 mg/mL), a slight reduction in the intensity of protein labeling was observed in the glandular cells when compared with the controls, while the structural preservation of the tissue was maintained (**Fig. 1F**).

3.2 HEART

3.2.1 Hematoxylin and Eosin (HE) staining

In the water control group, the myocardium showed fibers organized in parallel bundles, with cardiomyocytes displaying well-defined contours, homogeneous eosinophilic cytoplasm, and preserved central nuclei (**Fig. 2A**). No relevant structural alterations were observed.

In the ethanol control group, the overall organization of the myocardial bundles was preserved (**Fig. 2B**). The cardiomyocytes exhibited intact morphology, with no evidence of cell death (**Fig. 2B**).

In the group exposed to *C. sativa* extract (2.5 mg/mL), an increase in interfibrillar spaces was observed in certain areas, associated with slight irregularity in the alignment of myocardial fibers (**Fig. 2C**). The cardiomyocytes maintained preserved central nuclei and eosinophilic cytoplasm, with no evidence of cell death, fibrosis, or extensive structural disorganization (**Fig. 2C**).

3.2.2 Histochemistry (Bromophenol Blue)

In the control groups, bromophenol blue staining intensity showed homogeneity in the myocardial fibers and cardiomyocytes (**Fig. 2D-E**).

In the group treated with *C. sativa*, a reduction in staining intensity was observed in small areas, while the structural organization of the tissue was maintained (**Fig. 2F**).

Figure 2

Histological sections of the heart of female *Mus musculus* treated and untreated with *Cannabis sativa* extract, stained with hematoxylin-eosin (A-C) and bromophenol blue (D-F). A-D: water control; B-E: 30% ethanol control; C-F: treatment group treated with *C. sativa* extract at 2.5 mg/mL

4 DISCUSSION

The histological analysis of the uterine and cardiac tissues showed that spray exposure to *Cannabis sativa* extract (2.5 mg/mL) promoted mild structural alterations,

predominantly characterized by changes in cellular organization and protein staining intensity, with no evidence of irreversible tissue injury.

In the uterus, the treated group showed mild cytoplasmic vacuolization in glandular epithelial cells and between connective tissue cells of the stroma. The literature shows that endometrial tissue is highly sensitive to hormonal variations and bioactive stimuli and may present mild structural alterations even in the absence of destructive lesions (Hassan, 2025). The alterations observed in the present study suggest changes in the cellular morphofunctional pattern, although without total loss of tissue integrity.

The more evident vascular congestion in the stroma indicates an increased presence of erythrocytes in endometrial vessels, without extravasation or significant structural alteration. Mild vascular changes, such as increased intravascular filling, have already been described in experimental models subjected to hormonal stimuli and plant extracts with bioactive potential, without progression to necrosis or extensive stromal reorganization (Elgayed *et al.*, 2021; Hassan, 2025).

It is important to highlight that no areas of necrosis or cellular alterations suggestive of cell death were identified, indicating that the observed changes were predominantly structural and of low intensity. Experimental studies with *Cannabis sativa* extracts in murine models have also shown a similar profile, with absence of systemic toxicity and preservation of tissue architecture, even after prolonged exposure (Lima *et al.*, 2021). In a complementary way, morphometric analyses of the uterus of females treated with plant extracts did not show relevant structural alterations or organ enlargement (Araújo *et al.*, 2023).

In contrast, experimental models associated with more intense injuries, such as myocardial ischemia and reperfusion, frequently show marked alterations, including hemorrhage, edema, inflammatory infiltration, and significant structural damage (Aksoy *et al.*, 2026). The absence of these findings in the present study reinforces that the observed modifications do not characterize established tissue injury.

Histochemical analysis with bromophenol blue revealed a reduction in protein staining intensity in glandular cells of the treated group. Since this technique demonstrates total cytoplasmic and nuclear proteins, the lower staining intensity may reflect alteration or intracellular redistribution of structural proteins. From a morphological point of view, the association between mild epithelial irregularity and reduced staining intensity suggests a functional modification of glandular cells, although without signs of severe cytotoxicity. Mild cytoplasmic alterations, including variation in staining intensity and mild vacuolization, without evidence of necrosis or structural collapse, have also been described in the uterus of female

mice exposed to *Cleome gynandra* extract, a plant widely reported as capable of inducing uterine contraction (Monima *et al.*, 2019).

In cardiac tissue, the histological findings were also characterized by mild structural alterations. The increase in interfibrillar spaces observed in the treated group indicates mild separation between cardiomyocytes, without rupture of cell boundaries or nuclear fragmentation. Under normal conditions, cardiomyocytes show a parallel organization, with homogeneous eosinophilic cytoplasm and preserved central nuclei (Baudouy *et al.*, 2017).

The irregularity in myocardial fiber alignment observed in this study suggests alterations in myofibrillar organization, although the general arrangement of the bundles remained preserved. In the same way, Simeon and Tosin (2024), in their study on the subchronic toxicity of *Ocimum canum* plant extracts in mice, showed that even in the presence of small variations in myocardial arrangement, the overall cardiac structure remained preserved.

Bromophenol blue staining in the heart revealed reduced protein staining intensity in some areas of the tissue in the treated group. Since myocardial contraction depends on highly organized structural proteins, such as actin and myosin (Pacher & Steffens, 2009), variation in bromophenol blue staining intensity may suggest alteration in the distribution or intracellular protein content, although the technique does not allow differentiation or quantification of proteins, and therefore the interpretation remains limited to the histochemical staining pattern.

In general, both uterine tissue and myocardium maintained their structural organization, and no areas of hemorrhage, necrosis, marked cellular degeneration, or intense tissue disorganization were observed. Alterations such as these are frequently described in studies in which the uterus and heart are exposed to potentially toxic agents, such as plant extracts at high concentrations, environmental toxins, or conditions associated with significant oxidative stress and metabolic imbalance (Akşit *et al.*, 2023). In these situations, the literature reports loss of normal tissue structure, connective tissue reorganization, and presence of inflammatory infiltrate, findings that were not identified in the samples analyzed in this study.

The preservation of uterine and cardiac architecture suggests that, under the experimental conditions used, *Cannabis sativa* extract at the concentration of 2.5 mg/mL did not induce irreversible structural injury. Considering that cannabinoid receptors CB1 and CB2 are present in both reproductive and cardiovascular tissues (Paria & Dey, 2000; Pacher & Steffens, 2009), it is plausible that interaction with these systems may have contributed to the maintenance of tissue integrity, although a deeper understanding of the molecular and functional mechanisms involved is still needed in future studies.

Taken together, the results presented here indicate that exposure to *Cannabis sativa* extract, at the evaluated concentration of 2.5 mg/mL, was associated only with mild structural modifications, with no evidence of significant morphological toxicity in the organs studied.

ABSTRACT

This article analyses how Law No. 14,133/2021 and Complementary Law No. 182/2021 transformed the landscape of public procurement by introducing mechanisms geared towards innovation and technology transfer. It examines the impact of the competitive dialogue and of the Public Contract for Innovative Solutions (CPSI) in overcoming the historical limitations of the traditional bidding model, highlighting their potential to promote institutional learning and reduce information asymmetries. The research shows, however, that technology transfer is not automatic, being constrained by barriers such as insufficient technical competences, administrative insecurity and the risks of lock-in in digital solutions. It is concluded that, although the regulatory framework represents significant progress, its effectiveness depends on the state's capacity to internalise knowledge and mitigate technological dependencies.

RESUMO

Este artigo analisa de que maneira a Lei nº 14.133/2021 e a Lei Complementar nº 182/2021 transformaram o cenário das contratações públicas ao introduzirem mecanismos voltados à inovação e à transferência tecnológica. Examina-se o impacto do diálogo competitivo e do Contrato Público para Solução Inovadora (CPSI) na superação das limitações históricas do modelo licitatório tradicional, destacando-se seu potencial para promover aprendizagem

institucional e reduzir assimetrias de informação. A pesquisa evidencia, contudo, que a transferência tecnológica não é automática, sendo limitada por barreiras como insuficiência de competências técnicas, insegurança administrativa e riscos de lock-in em soluções digitais. Conclui-se que, embora o marco normativo represente avanço significativo, sua efetividade depende da capacidade estatal de internalizar conhecimento e mitigar dependências tecnológicas.

1 INTRODUCTION

Bidding is a formal and competitive process used by the Public Administration to contract services, acquire goods or carry out works. Bidding may be defined as an administrative procedure in which the public entity, under conditions predetermined in the convening instrument of its respective modality, opens to all interested parties the possibility of formulating proposals, from which the most convenient one will be selected for the conclusion of a contract (Di Pietro, 2022).

The historical evolution of the bidding process in Brazil dates back to 1862, with the first regulations that sought to organise public awards. Since then, the model has undergone successive transformations and improvements, especially throughout the twentieth century, until it culminated in Law No. 8,666/1993, which consolidated a robust, unified bidding system that was broadly applicable to the Public Administration (Pompeu, 2022).

Law No. 8,666/1993 represented a milestone in the consolidation of the legal regime of public procurement, by unifying rules and standardising procedures for all federative entities. Its rigid and detailed character sought to confer legal certainty and to curb irregular practices, structuring modalities, phases, judgment criteria and hypotheses of waiver and non-requirement. Although it played a central role for decades, its emphasis on formality ended up limiting the flexibility necessary for more complex and innovative procurement, which contributed to subsequent legislative movements aimed at modernising the system.

In the first place, it must be said that Law No. 8,666 of 1993 failed in its two main objectives. Conceived to combat corruption and to make public procurement more effective (this second guideline translated, notably, into the express objective of seeking the most advantageous proposal for the Public Administration), the Law unfortunately managed to achieve neither one intent nor the other. Under its aegis, reports of corruption cases continued to abound, especially (but not only) in the contracting of works and services. (Rocha, Vanin, Figueiredo, 2021, p. 21).

Seeking to overcome this scenario of inefficiency and rigidity, the Brazilian legal system inaugurated a new stage in 2021. With the publication of Law 14,133/2021, several institutes that were routinely used were repealed, new procedures were implemented, and the rules on the public agents involved in bidding were modified, among other changes.

Law No. 14,133/2021 (the New Bidding Law) incorporates innovation as one of its express objectives (art. 11, sole paragraph). Aragão (2021) points out that the law inaugurates a new phase in which the interaction between public and private is no longer viewed with suspicion, but becomes collaborative, exemplified by the Competitive Dialogue.

In this scenario of strengthening the culture of innovation in public procurement, it becomes evident that the transformation promoted by Law 14,133/2021 does not occur in isolation.

With the aim of remedying market failures and filling gaps present in public policies, especially regarding the creation of adequate regulatory frameworks, the planning and implementation of promotion actions aligned with local realities, in addition to regulating concepts that until then had no legal provision at the federal level, the Legal Framework for *Startups* and Innovative Entrepreneurship (LC 182/2021) was enacted in June 2021. This legislation establishes incentives not only for *startups* and investors, but also for the State itself and for society, which come to benefit from the innovative solutions that may emerge from it (Alves, 2023).

The Public Contract for Innovative Solutions (CPSI) establishes a differentiated legal regime that authorises the State to carry out performance tests for disruptive technologies in real-use scenarios. According to the teaching of Mendonça, Portela and Maciel Neto (2022), this model presents the novelty of allowing payment to the supplier while still in the experimental phase, which breaks with the traditional logic of public acquisition. In this context, the Administration's focus does not fall on the physical purchase of a device or machinery, but rather on the empirical validation that the proposed innovation is effective in solving the previously diagnosed administrative problem, prioritising practical usefulness and the performance of the solution over the mere possession of the material good.

The procedure allows the Administration to launch technological challenges and to contract *startups* through simplified processes, focused on results and feasibility tests, breaking with the previous rigidity of Law 8,666/1993. The delimitation of the scope of the bidding may be restricted to the indication of the problem to be solved and of the expected results, dispensing with the description of any technical solution previously mapped and its specifications, leaving it to the bidders to propose different means for solving the problem.

The winners conclude the CPSI, which allows the performance of remunerated tests in a real environment. Should the innovative solution prove successful, the Administration may conclude a supply contract, with limited term and values, with the proponent that achieves the established goals. This modality represents an important instrument of rapprochement between the public sector and emerging technology-based companies, promoting open innovation in the Public Administration (Portela, 2022).

Considering the current scenario of paradigmatic transition, this research has as its central purpose to analyse how Law No. 14,133/2021 and Complementary Law No. 182/2021 reorient the public procurement system in Brazil towards the encouragement of innovation.

For the development of this analysis, the study is grounded on the following specific objectives: to assess the operationality of the competitive dialogue and of the Public Contract for Innovative Solutions (CPSI) as paths for overcoming excessive bureaucratic formalism; to investigate the potentialities and limits of these new institutes in promoting technology transfer to the public sector; and to diagnose the main institutional challenges, such as the lack of technical expertise and the risks of technological dependence (*lock-in*), which may hinder the integration of new knowledge by the State. In this way, the aim is to verify the effectiveness of the current legal framework as an instrument for fostering innovation and for enhancing the administrative capacities of the State.

2 THEORETICAL FRAMEWORK

The theoretical foundation of this study rests on the analysis of the contemporary normative benchmarks that underpin the promotion of innovation in Brazilian public sector procurement. From this perspective, the transition from the regime established by Law No. 8,666/1993 to the 2021 legal framework reveals a fundamental paradigmatic rupture, in which the traditional model, of strictly formalist character, is superseded by a system that privileges administrative efficiency and technological promotion. In this context, the new legal apparatus seeks not only procedural modernisation, but the consolidation of an environment geared towards the enhancement of state capacities and the pursuit of more effective results for the collectivity.

2.1 INNOVATION IN LAW NO. 14,133/2021

The enactment of Law No. 14,133/2021, which took place on 1 April 2021, redesigned the panorama of state acquisitions by elevating innovation to the *status* of an express purpose of the tender. Through the interpretation of Article 11, item IV, and its sole paragraph, the promotion of sustainable national development and of technological progress become fundamental guidelines, requiring from the administrative structure more qualified planning and rigorous contractual monitoring. In this context, Aragão (2021) considers that this new legal framework overcomes the historical dichotomy between the public and private spheres, inaugurating an era of institutionalised collaboration.

The system introduced by the new legal diploma broadens legal certainty by consolidating mechanisms that encourage the public sector and create an environment favourable to innovation-based entrepreneurship. The State's significant economic power, reflected in the volume of its procurement, comes to act as a strategic lever for public policies focused on technical development. In view of the fluidity and complexity of the global

scenario, the Public Administration must not remain static; on the contrary, it must make use of public procurement as the necessary path for the renewal of institutions, meeting the demand for more agile, efficient services integrated with contemporary technologies (Freitas Jr., 2022).

However, for these general innovation guidelines to materialise into partnerships with technology-based companies, the Brazilian legal system was complemented by more specific rules. In this sense, it becomes indispensable to analyse how the Legal Framework for *Startups* dialogues with this new reality, instituting tailor-made instruments for technological experimentation in the public sector.

2.2 THE LEGAL FRAMEWORK FOR STARTUPS AND THE PUBLIC CONTRACT FOR INNOVATIVE SOLUTIONS (CPSI)

Although Law No. 14,133/2021 consolidated innovation as a fundamental guideline of the contemporary Public Administration, its practical application in disruptive technology markets lacked a set of rules that conformed to the reality of emerging companies. In this panorama, Complementary Law No. 182/2021, named the Legal Framework for *Startups*, is configured as an essential microsystem for giving effectiveness to the general bidding rules, providing the operational support indispensable so that the innovative mandate does not remain at the abstract level.

From the perspective of Novaes (2024), the aforementioned legislation structures the participation of *startups* along three fundamental axes: the definition of principles for administrative conduct, the stimulus to the capitalisation of the sector and the implementation of a debureaucratized bidding procedure. In this way, a strategic convergence between the normative frameworks is verified as they foster collaborative interaction between the State and private initiative, transforming the significant governmental purchasing power into a vector of development for products generated in innovation ecosystems.

However, it is imperative to observe the existence of a significant technical distinction regarding the concept of *startup*, because, whereas the general 2021 rules adopt a broad definition, anchored in the Statute of Micro and Small Enterprises, LC No. 182/2021 establishes more rigorous and specific requirements (Novaes, 2024). This conceptual density is fundamental for conferring the legal certainty indispensable to the use of instruments that involve experimentation and risk, such as the Public Contract for Innovative Solutions (CPSI), ensuring that the Public Administration may validate technological solutions in a real environment before an eventual large-scale acquisition.

The CPSI materialises a change of logic by authorising the Administration to carry out remunerated tests in real scenarios to assess the feasibility of technologies still in the maturation stage. Article 13 of the Legal Framework for Startups and Innovative Entrepreneurship (MLSEI) authorises the contracting of natural or legal persons for the performance of these tests, regardless of the degree of technological risk involved. As Mendonça, Portela and Maciel Neto (2022) explain, the core of the CPSI does not reside in the immediate patrimonial acquisition, but in the technical validation that the proposed solution has the capacity to solve the identified public problem:

a special contract that allows the Administration to contract tests to evaluate the performance of innovative solutions in a real environment. In an unprecedented manner, even during the tests, suppliers may be remunerated. Even if the innovative solution is a device or a machine, the object of the CPSI will not be the acquisition of the machine or the device, but rather the demonstration in a test environment that such an innovative solution solves the problem identified by the public administration. (Mendonça, Portela E Maciel Neto, 2022, p. 470-475).

In opposition to the classic bidding model, the CPSI institutionalises the so-called “technological neutrality”, since the Public Power limits itself to delimiting the problem and the desired results, transferring to the bidders the responsibility for proposing the most adequate technical solution. This logical inversion demands the adoption of multidimensional judgment criteria that go beyond the merely formal analysis. As Oliveira (2024) sustains, the selection must weigh the potential to resolve the challenge, the development stage of the proposal and the feasibility of the business model, even enabling the Administration to conclude multiple contracts simultaneously to address the same institutional bottleneck.

From the standpoint of public management, the CPSI acts as a true catalyst of transversal transformations, allowing the adaptation of technological solutions to generate innovations that transcend the contracted object itself and reach the very governance of the organisations involved. This process of institutional learning enables what Lana (2021) terms the incubation of emerging technologies within the state apparatus, promoting a technical maturing that benefits both the public and the private sector.

On the theoretical plane, the preliminary stages of this adjustment resemble pre-commercial agreements, aiming to mitigate critical gaps, such as the communication failure between buyers and suppliers and the historical exclusion of small companies holding embryonic solutions. Oliveira (2024) points out that this mechanism reduces the informational asymmetry and the risk aversion inherent to highly complex projects. In this way, the CPSI consolidates itself as a strategic instrument of public policy that prepares the legal ground so

that, after validation of the solution's effectiveness in a real environment, the State may advance with confidence towards the definitive contracting of the supply.

2.3 COMPETITIVE DIALOGUE: CONCEPT AND INTERACTION WITH THE MARKET

Whereas the Public Contract for Innovative Solutions (CPSI) prioritises celerity and technological experimentation in *startup* ecosystems, the competitive dialogue, introduced by Law No. 14,133/2021, is geared towards procurement of high technical or infrastructural complexity. This modality finds its genesis in European Law, notably in Directives 2004/18 and 2014/24 of the European Union, which recognised the need for more flexible procurement methods for the promotion of efficiency and sustainable growth (Pereira Neto; Pereira, 2024). Under the aegis of the previous regime, established by Law No. 8,666/1993, the Public Administration faced the paradox of needing to describe the object in minute detail even without knowing the technical solutions available in the market, which invariably generated inefficiencies and obsolescence.

For the concrete viabilisation of innovation by the public entity, the new bidding law brought, among its bidding modalities, the competitive dialogue, being a modality of procurement in which the Public Administration holds dialogues with selected bidders to develop alternatives that meet its needs. This modality is used in special situations where there is technological or technical innovation, and the Administration does not possess sufficient technical knowledge to specify the most adequate solution. The competitive dialogue provides interaction with market agents, in order to promote greater knowledge for the Administration, so that a notice may be drawn up with an objective description of the solution and the definition of the criteria that will be used for the selection of the proposal (Couto e Capagio, 2021).

Initially, the pre-selection of economic agents takes place, in order, at a second moment, to begin the debate phase properly. In this way, this structure allows the dialogue to develop in successive phases, gradually reducing the number of proposals until the solution that best satisfies the Administration's demands is identified, breaking with the rigidity of the traditional bidding model (Pereira Neto; Pereira, 2024).

The application of this modality is restricted and conditioned on the cumulative fulfilment of requirements established in art. 32 of Law No. 14,133/2021, such as: i) the presence of technological or technical innovation; ii) the impossibility of satisfying the need without the adaptation of market solutions; and iii) the Administration's incapacity to define the technical specifications with sufficient precision. As it is an exceptional bidding hypothesis, its choice must be technically motivated, demonstrating that the dialogue is the instrument that

best contemplates the public desire due to the disruptive nature of the object (TCU, 2024). Justen Filho (2021) warns that the innovative dimension of the dialogue requires the setting aside of traditional hermeneutic standards, adopting a more dynamic and flexible interpretation to embrace methods capable of meeting the complex and evolving demands of the public sector.

In practice, the procedure establishes that the Administration present its needs and requirements already defined, opening a minimum period of 25 working days for the expression of interest in participation. The pre-selected bidders participate in meetings recorded in minutes and audio-recorded, in which they develop one or more alternatives capable of meeting the Administration's needs. The dialogue phase may be maintained until the Administration identifies the adequate solution or solutions, there being the possibility of successive phases with progressive restriction of the solutions or proposals, according to the guidelines of the Federal Court of Accounts (TCU, 2024).

After the closure of the dialogues, the competitive phase begins with the disclosure of a notice containing the specification of the solution and the objective selection criteria, with a period of no less than 60 working days for the presentation of final proposals (TCU, 2024).

In sum, the legal system outlined by Law No. 14,133/2021 and by Complementary Law No. 182/2021 provides the normative support apt to allow the Brazilian Public Administration to mitigate the traditional bureaucratic formalism and to assume an inducing role in technological development. However, the doctrine and the administrative *praxis* show that legislative evolution, although indispensable, does not by itself ensure the conversion of the State into an effective facilitator of technology transfer.

From this standpoint, the functionality of institutes such as the Competitive Dialogue and the CPSI is intrinsically linked to the maturity of institutions in managing risks, reducing informational asymmetries and absorbing the technical knowledge originating from partnerships with the private sector. Thus, the understanding of how this legal potential is converted into practical results, as well as the identification of the institutional obstacles that still persist, demands a thorough investigation of the scientific and documentary production, whose methodological contours will be detailed in the subsequent section.

3 METHODOLOGY

The present research is guided by a qualitative approach of a bibliographic nature, structured with the purpose of investigating the transformations that occurred in the regime of Brazilian public procurement destined to foster innovation. In order to confer the

methodological rigour and reliability necessary to the findings, the procedures were organised into complementary stages of data collection and treatment.

In a first moment, a detailed normative analysis was carried out, with central focus on Law No. 14,133/2021 and on Complementary Law No. 182/2021, integrating this examination into a comprehensive doctrinal review on the axes of public innovation and technology transfer. The bibliographic universe comprised the study of legal frameworks, reference works, scientific articles and applied studies that specifically address the competitive dialogue and the Public Contract for Innovative Solutions (CPSI), in addition to the structural challenges for the absorption of new knowledge by the state apparatus.

As regards the treatment of the selected material, interpretive and comparative analysis was adopted, a method that allowed diagnosing the convergences, the limitations and the practical implications of the new legal institutes. Through this path, the aim was not only the description of the normative text, but the assessment of its applicability in the face of the complexity of contemporary administrative demands, mapping the institutional barriers that still obstruct the effective implementation of innovation in the Public Administration.

4 RESULTS AND DISCUSSION

4.1 THE OBSTACLES OF THE TRADITIONAL MODEL AND THE PARADOX OF THE STATIC OBJECT

From the perspective of the legislative evolution analysed thus far, it is imperative to recognise that the transition to the new bidding regime is grounded on the exhaustion of a model that became incompatible with the complexity and the dynamism of the contemporary market. The diagnosis of this failure is, essentially, of an institutional nature, as evidenced in the final report of the Modernisation Commission of the Federal Senate (CTLICON). The aforementioned document indicated that the effectiveness of Law No. 8,666/1993, although it represented a relevant milestone at its genesis, was not capable of promoting the necessary equalisation between the demands of the Administration and the reality of current technological solutions. In this sense, the excessive rigour of the rule frequently proved impractical or even unenforceable, which ended up generating a scenario of profound insecurity for managers and, in parallel, opened room for unfair conduct on the part of suppliers.

In this context of procedural limitations, such institutional rigidity culminated in a paradox of complex procurement. Under the reign of Law No. 8,666/1993, the Public Administration was frequently compelled to describe the object in minute detail while still in

the basic design phase, even in the face of the lack of knowledge of the most advanced technological alternatives available in the market.

This requirement of a static object disregarded the premise that, in projects of high technical density, the ideal solution must be built dialogically throughout the process. As a direct consequence, this anachronistic model fostered the occurrence of deserted biddings, failed tenders and an interminable succession of contractual amendments that sought, almost always without success, to adapt the legal instrument to the supervening technical reality (Novaes, 2024).

It is possible to note that the fragilities of the old Law No. 8,666/1993 become even more evident when we analyse cutting-edge technology sectors. From this standpoint, Pellegrini *et al.* (2017) emphasise that the previous model was incapable of keeping pace with the feedback cycles and the so-called technological “*loops*”, which are an intrinsic part of the process of innovating.

In projects of high complexity, the rule would need to act as a tool that would assist the State in extracting information essential for decision-making. However, the old set of rules failed by ignoring fundamental aspects, such as transaction costs and the very incompleteness of technological contracts, which, by their very nature, cannot be fully anticipated at the moment of contracting.

Aiming to overcome these obstacles, Novaes (2024) argues that the management of complex adjustments requires a broadening of managerial powers and, inevitably, a greater margin of freedom in procurement. This need for flexibilisation justifies the distancing from the procedural rigidity of the past, allowing the Public Power to launch technological challenges focused on practical results and functionality tests. By concentrating the scope of the tender on the delimitation of the problem and of the expected effects, the Administration dispenses with the detailed description of a prior technical solution, delegating to the participants the responsibility of proposing the paths and means necessary for the resolution of the state challenge.

To overcome these obstacles, the management of complex adjustments requires a broadening of managerial powers and greater freedom in procurement. This need for flexibilisation justifies the distancing from the procedural rigidity of the past, opening the way for the Public Power to use interaction with the market as an intelligence tool, a transition that materialises with the advent of Law No. 14,133/2021.

4.2 THE DIALOGIC TURN: LAW NO. 14,133/2021 AND THE COMPETITIVE DIALOGUE

With the aim of overcoming the rigidity that characterised the previous regime, Law No. 14,133/2021 consolidates the dialogic administration, replacing excessive formalism with a strategic interlocution between the State and private initiative. Under this new perspective, the dialogue with the private party ceases to be regarded with distrust in order to become an essential collaborative tool. This change of stance allows the Public Administration to mitigate the asymmetry of information and to identify, with greater clarity, the market solutions that are truly effective for the challenges of the public sector.

The competitive dialogue concretises this change of paradigm by acting as a refined instrument for the revelation of information for the Public Power. Whereas under the regime of Law No. 8,666/1993 the Administration was forced to establish the object unilaterally, the current legal system allows the state entity to present only its needs and the technological bottlenecks it intends to overcome, transferring to private initiative the burden of proposing technically feasible solutions.

From an innovative standpoint, Krieger *et al.* (2021) emphasise that this modality is also characterised as an alternative means for the resolution of conflicts within the administrative sphere. This mechanism ensures the manager an avenue of active interaction that, in times past, was restricted to institutes such as mediation or conciliation, strengthening consensuality and efficiency in the pursuit of the best public interest.

As Couto and Capagio (2021) point out, this interaction with market agents promotes superior technical knowledge for the Administration, allowing the drawing up of notices with objective descriptions and selection criteria aligned with the current technological reality. Procedurally, this transition requires the Public Administration to act as a mediator of innovative solutions, drastically reducing contractual uncertainties and transaction costs. The differential lies in the flexibility of the dialogue, which allows listening to the market before defining what to contract, ensuring that the final notice reflects real solutions and avoids technically inadequate proposals. According to Gonçalves and Torres (2025), the merit lies in the capacity to build alternatives jointly, extracting from the private sector a technical knowledge that the public entity often does not possess autonomously.

In this way, by breaking with the unilateral and static paradigm of traditional biddings, the new legal system allows the supplier market to be raised to the condition of strategic partner of the Administration. The competitive dialogue ceases to be understood as a simple avenue of acquisition in order to consolidate itself as an instrument of state intelligence, apt to enable the collaborative development of solutions that effectively meet the public interest. From this standpoint, the new dynamic of partnership in favour of innovation paves the way

for the application of even more flexible institutes, such as the Public Contract for Innovative Solutions (CPSI), whose focus falls primarily on experimentation and the management of technological risk in a real environment.

4.3 THE CPSI AND TECHNOLOGICAL EXPERIMENTATION

Unlike the Competitive Dialogue, which is geared towards large-scale infrastructure undertakings or systems of high complexity, the CPSI, instituted by Complementary Law No. 182/2021, privileges celerity and the experimentation of emerging technologies. Under this new logic, the solution submitted to the test may even be in the development stage, not yet being available for free commercialisation. In this sense, the absence of an exhaustive description of the object must not be interpreted as a technical deficiency of the Public Administration, but rather as a characteristic inherent to the very nature of the instrument, as the Office of the Attorney General of the Union (Advocacia-Geral da União) points out (2025). The introduction of the CPSI therefore configures a structural rupture with the traditional model, allowing the State to remunerate the execution of tests in a real environment and to evaluate the results in an incremental manner.

By enabling this dynamic, the CPSI integrates into administrative practice fundamental principles of innovation ecosystems, such as prototyping, iterative adjustments and learning by use. This legal arrangement redefines governmental strategies by transitioning from the stimulus focused on supply to the incentive oriented by demand. As Oliveira (2024) observes, this approach prioritises the creation of markets and incentives that make viable the effective adoption of the innovations produced, transforming the supplier market into an active agent in the construction of strategic solutions for the public interest.

The flexibilisation brought by the Legal Framework for *Startups* reduces the historical distance between public bodies and technology-based companies, favouring technology transfer through a continuous interaction between developers and managers during the validation phases (Mendonça; Portela; Maciel Neto, 2022). This process overcomes the classic limitations of Law No. 8,666/1993, which hindered the contracting of objects whose results were uncertain. By admitting technological risk and allowing its shared management, the CPSI broadens the state's capacity to participate in the development cycle, enabling incipient technologies to be incubated and improved within the public sector itself (Lana, 2021).

As regards technology transfer, the CPSI establishes mechanisms that allow the knowledge generated during the tests to be internalised by the Public Administration and, subsequently, converted into definitive supply contracts. The State comes to play an active

role in the conversion of experimental technologies into operational solutions, facilitating the transition between applied research and governmental adoption. In this way, the CPSI acts as a vector of permeability of the state apparatus to science and to innovative practices. However, it is imperative to recognise that the legal framework, on its own, does not guarantee innovation automatically, since its effectiveness still runs up against institutional barriers and cultural traits of the public service that resist new management models.

4.4 TECHNOLOGY TRANSFER AS A POSSIBLE, BUT NOT AUTOMATIC, RESULT

Public procurement geared towards innovation, operationalised through the CPSI and the Competitive Dialogue, reveals a singular capacity to transcend the limitations of traditional acquisition models, which frequently prove insufficient to meet the complex demands of contemporary society. However, the application of these institutes in the Brazilian scenario is still incipient, tending to concentrate on the optimisation of internal flows to the detriment of structural transformations of broad collective interest (Sousa e Vieira, 2025).

In this scenario, several obstacles impede the full advancement of innovation, such as the lack of technical competences, the lack of knowledge of the new legal frameworks and the scarce experience of public agents, who lack continuous and interdisciplinary training. Added to this picture is the fear of individual accountability, a sentiment that fosters a culture of self-protection and contributes to the phenomenon of the “apagão das canetas” (pen blackout). From the standpoint of Cunha (2026), the effectiveness of these modalities presupposes a careful implementation, supported by robust governance policies and the constant improvement of human capital.

Despite such obstacles, the 2021 legal system established the bases for technology transfer to occur through distinct paths. Within the scope of the CPSI, the transfer materialises through co-production, in which the monitoring of the tests in a real environment promotes an intensive exchange of knowledge between the state technical staff and the *startups*, allowing new solutions to be gradually assimilated as institutional learning. In the Competitive Dialogue, on the other hand, this process occurs through the making explicit of private knowledge, at which moment the bidders reveal technologies and technical limitations for the refinement of the object, which reduces the knowledge gap and allows the State to become familiar with emerging innovations even before the definitive contracting.

However, this learning only consolidates itself as internalised technology if the administrative structure possesses critical capacity to process such information. The legal literature shows that internal limitations constitute severe bottlenecks, since:

a good part of those who make up the body of servants of public entities is not qualified even to conduct a bidding process, let alone to identify the problem and to technically create a challenge to be overcome. More than that, the absence of regulation of the internal phase of the bidding procedure [...] ends up inhibiting its use in the face of the culture of self-protection and administrative complacency (Rezende, 2025, p. 46-47).

From another standpoint, one of the most critical risks in this process is the phenomenon of technological *lock-in*, a situation in which the Public Administration comes to depend excessively on a single supplier, compromising its decision-making autonomy (Narasimhan *et al.*, 2009). In the public sector, this entrapment occurs when the operation or the evolution of complex systems, such as Artificial Intelligence models or cloud services (SaaS), become restricted to the private partner (Soares, 2025). The lack of transparency in the algorithmic logic prevents the effective internalisation of knowledge, resulting in a worrying outsourcing of state intelligence.

In this way, although greater interaction with the market is necessary, it also broadens the risk of capture of public agents, in which the asymmetry of information may induce decisions that favour private interests to the detriment of the common good. Avoiding technological entrapment and capture requires the recognition that administrative modernisation does not amount to the mere acquisition of products, but to the construction of solid state capacities, grounded on open technical standards and on the preservation of digital sovereignty.

5 CONCLUSION

The analysis undertaken demonstrated that the normative innovations introduced by Law No. 14,133/2021 and by Complementary Law No. 182/2021 significantly reconfigure the space for innovation in Brazilian public procurement. The mechanisms of the Competitive Dialogue and of the Public Contract for Innovative Solutions (CPSI) respond to historical limitations of the traditional model, overcoming bureaucratic rigidity and the paradox of the static object that rendered experimentation and allocative efficiency unfeasible. By allowing a strategic and transparent interaction with the market, such instruments reduce the knowledge gap between the State and private initiative, broadening the state's potential for absorbing disruptive technologies.

However, the results show that technology transfer, although legally possible, is not an automatic result of legal validity. Severe institutional obstacles persist, such as the insufficiency of the servants' technical competences, the fear of individual accountability, the “apagão das canetas” (pen blackout), and the marked informational asymmetry. Furthermore, the risk of capture of public agents by private interests and the danger of technological

entrapment (*lock-in*) in proprietary models were identified, especially in solutions based on *Software as a Service* (SaaS) and artificial intelligence, which may compromise the State's digital sovereignty.

The investigation also revealed significant gaps in the academic debate and in administrative practice. It was verified that the use of these new frameworks is still incipient and frequently restricted to internal optimisations. Although the literature on the theoretical aspects of Law No. 14,133/2021 is vast, the production that empirically analyses how these instruments result in effective technology transfer, or how organisational culture impacts the mechanisms of institutional learning, is still reduced.

In view of this scenario, relevant paths for future research emerge, highlighting: (i) empirical studies on the implementation of these modalities in different federative spheres; (ii) the development of indicators of technological absorption by the Public Administration; (iii) investigations on data governance in AI procurement for the prevention of *lock-in*; and (iv) comparative analyses on the reduction of litigation after the adoption of dialogic rites.

It is concluded, therefore, that normative advancement is a necessary but not sufficient condition for transforming the State into an agent that induces innovation. The effectiveness of these instruments depends on continuous investments in human capital, institutional strengthening and a strategic governance geared towards transparency and integrity. Only with the overcoming of the barriers of state capacity will it be possible to convert the potential of the new laws into concrete, sustainable results, rigorously aligned with the public interest.

ABSTRACT

This article analyzes the structural transformation of Brazil's public procurement system driven by the convergence of State, business, and integrity as vectors of a new institutional architecture oriented toward sustainable development. It argues that sustainability—understood in its environmental, social, and economic dimensions—has moved beyond a merely programmatic guideline to become a binding legal norm and the central metric for assessing administrative performance, in direct alignment with the UN 2030 Agenda and, in particular, SDG 16, which calls for building effective, accountable, and transparent institutions at all levels. The study examines the normative trajectory from the 1988 constitutional foundations to the enactment of Law 14,133/2021, identifying the construction of new horizons that break with the bureaucratic-formalist model in favor of a managerial rationality focused on generating public value. It demonstrates how the State, through the strategic exercise of its purchasing power—which mobilizes approximately 15% of national GDP—assumes the role of catalyst for structural market transformations, inducing business practices aligned with ESG criteria, technological innovation, and corporate integrity programs. The research contends that integrity, far from constituting a mere formal compliance requirement, emerges as a structuring principle of a new ecosystem of public governance, operating simultaneously as a mechanism for risk mitigation, institutional trust-building, and alignment between public and private interests.

RESUMO

Este artigo analisa a transformação estrutural do sistema brasileiro de contratações públicas a partir da interação entre Estado, empresa e integridade como vetores de uma nova arquitetura institucional orientada ao desenvolvimento sustentável. Aponta que a sustentabilidade – compreendida em suas dimensões ambiental, social e econômica – transcendeu sua condição de diretriz programática para consolidar-se como norma jurídica vinculante e métrica central de avaliação da performance administrativa, em alinhamento direto com a Agenda 2030 da ONU e, particularmente, com o ODS 16, que preconiza a construção de instituições eficazes, responsáveis e transparentes em todos os níveis. O estudo examina o percurso normativo desde os fundamentos constitucionais de 1988 até a promulgação da Lei 14.133/2021, identificando a construção de novos horizontes, rompendo com o modelo burocrático-formalista em favor de uma racionalidade gerencial focada na

geração de valor público e na eficiência. Demonstra-se como o Estado, no exercício estratégico de seu poder de compra – que mobiliza aproximadamente 15% do PIB nacional –, assume papel de catalisador de transformações estruturais no mercado, induzindo práticas empresariais alinhadas aos critérios ESG à inovação tecnológica e aos programas de integridade corporativa. A pesquisa procura estabelecer que o desenvolvimento sustentável, aliado à integridade, longe de constituir mero princípio formal, emerge como fundamento estruturante de um novo ecossistema de governança pública, operando simultaneamente como mecanismo de mitigação de riscos, construção de confiança institucional e alinhamento entre interesses públicos e privados.

RESUMEN

Este artículo analiza la transformación estructural del sistema brasileño de contrataciones públicas a partir de la interacción entre Estado, empresa e integridad como vectores de una nueva arquitectura institucional orientada al desarrollo sostenible. Señala que la sostenibilidad —comprendida en sus dimensiones ambiental, social y económica— trascendió su condición de directriz programática para consolidarse como norma jurídica vinculante y métrica central de evaluación del desempeño administrativo, en alineamiento directo con la Agenda 2030 de la ONU y, particularmente, con el ODS 16, que preconiza la construcción de instituciones eficaces, responsables y transparentes en todos los niveles. El estudio examina el recorrido normativo desde los fundamentos constitucionales de 1988 hasta la promulgación de la Ley 14.133/2021, identificando la construcción de nuevos horizontes, rompiendo con el modelo burocrático-formalista en favor de una racionalidad gerencial centrada en la generación de valor público y en la eficiencia. Se demuestra cómo el Estado, en el ejercicio estratégico de su poder de compra —que moviliza aproximadamente el 15% del PIB nacional—, asume el papel de catalizador de transformaciones estructurales en el mercado, induciendo prácticas empresariales alineadas con los criterios ESG, la innovación tecnológica y los programas de integridad corporativa. La investigación busca establecer que el desarrollo sostenible, aliado a la integridad, lejos de constituir un mero principio formal, emerge como fundamento estructurante de un nuevo ecosistema de gobernanza pública, operando simultáneamente como mecanismo de mitigación de riesgos, construcción de confianza institucional y alineamiento entre intereses públicos y privados.

1 INTRODUCTION

Understanding the sustainable public procurement system requires, as a starting point, a genuine re-signification of the structuring concepts of State, business and integrity, for it is precisely in the friction—and cooperation—among these three poles that the possibility of public spending oriented toward the production of public value is decided. The State, traditionally conceived as a politico-legal organization dedicated to the realization of the common good, endowed with public-law personality and supported by the tripod of people-territory-sovereignty, is not merely a bureaucratic mechanism charged with “keeping” administrative procedures “moving”; it is, above all, a normative agent and inducer of public policies, holder of a peculiar capacity to create, apply and radiate the Law into social life. State action, especially when it mobilizes its purchasing power, projects itself beyond the procedural rite: it becomes a technology for constitutional implementation, capable of inducing conduct, reorganizing markets and signalling civilizational priorities.

Another tool inseparable from the full functioning of this mechanism concerns the business enterprise—which, under the terms of Article 966 of the Civil Code—is the organized economic activity, professionally conducted with a view to producing or circulating goods and services. This normative statement, although succinct, reveals a complex universe of the organization of factors of production, economic rationality and professionalism, so that the enterprise comes to operate as an essential node of the networks that connect investment, innovation, labour and consumption. In view of this, State and business do not figure as episodic antagonists confronting one another in bidding procedures, but as interlocutors within the same governance arena, co-participants in an economic and social cycle that demands coordination, predictability and reciprocal responsibility. It is precisely in this dialogic space that it becomes possible to move from the binomial “regulate and punish” to the logic of “plan, contract and deliver value”.

Integrity, in turn, plays the role of the normative-axiological axis of this arrangement. As Marcelo Zenker recalls, the concept can be read in the philosophical, legal, ethical and personal registers; for the present study, what matters above all is the legal-institutional dimension, in which integrity presents itself as an articulated set of principles, structures and practices that guide the conduct of agents and organizations. To be of integrity is to be whole—not split, not fragmented—and, within the scope of public procurement, this means aligning intention, procedure and outcome: preventing deviations, reducing information asymmetries, mitigating risks of capture, ensuring transparency and, ultimately, sustaining the legitimacy of the administrative decision before society. Integrity ceases to be a rhetorical

adornment and becomes a parameter of governance and a criterion for the quality of spending.

When projected onto the specific field of sustainable public procurement, these three elements—State, business and integrity—acquire singular relevance. It is not a matter of “yet another” procurement tool, but of a contracting axiom which, from its genesis, incorporates environmental, social and economic values as instruments for promoting national sustainable development.

State purchasing power, in this sense, becomes a vector of structural transformation: through technical specifications, judgment criteria, performance requirements, life-cycle cost analysis and the mitigation of negative externalities, the Administration does not merely acquire an object; it produces systemic effects, corrects market failures, disseminates technological standards and induces production chains toward cleaner and more inclusive trajectories. And this is not out of voluntarist zeal, but because the 1988 Constitution binds the economic order to social justice and sustainable development (Art. 170, VI) and elevates the ecologically balanced environment to the condition of a fundamental right (Art. 225), imposing duties of immediate—and not merely programmatic—protection.

In this key, the ecosystem of sustainable public procurement must be read as an interdependent network in which State, businesses, society and the environment are articulated according to a rationality of public value: price ceases to be the only guiding light, and “lowest cost” gives way to the “best outcome” for the true public interest.

The governance that emerges from this design is less hierarchical and more collaborative; it incorporates metrics that transcend immediate economics to measure social impacts, environmental value, responsible innovation and the dynamization of local economies. It is at this point that administrative law reveals its contemporary vocation: to execute the Constitution by way of management, a phenomenon that legal doctrine describes as the constitutionalization of administrative law and the administrativization of constitutional law—a two-way movement that brings principles and practices, principles and outcomes, closer together.

The Brazilian normative trajectory mirrors this inflection. The 1988 Constitution established the centrality of the environment and oriented the economic order by the vector of sustainable development; Law No. 8.666/1993, however, crystallized a strongly procedural model, with little openness to sustainability criteria. The maturing cycle began with statutes such as Law No. 12.305/2010 (National Solid Waste Policy) and the planning and budget commands that authorized socio-environmental parameters, gained muscle with Decree No. 7.746/2012 (which imposed sustainability criteria in procurement) and its infra-legal detailing

norms, and reached synthesis in the new framework of Law No. 14.133/2021, by reaffirming national sustainable development as a fundamental guideline of contracting and by redesigning instruments of planning, supplier selection and contractual execution. What was previously tolerated as “good practice” became due as a legal duty of conformation.

This path reveals the transition from a model centred on formal compliance and short-term economy to a paradigm of strategic, results-oriented contracting. The Administration ceases to be a clerk to become a manager: it plans on the basis of evidence, contracts by performance, monitors risks and assesses impacts. Considering that public acquisitions represent an expressive share of GDP, the way in which the State buys directly affects the country's development trajectory—whether to perpetuate negative externalities or to catalyse clean innovation, productive inclusion and resilient chains. The new standard requires adherence to the fundamental right to good administration, to efficiency as a duty and to the constitutional objectives of an economic, social and environmental nature, all densified into norms of immediate application.

In sum, sustainable public procurement does not constitute a peculiarity of administrative law, but a mechanism for constitutional realization that articulates State, business and integrity around a governance oriented toward public results. By integrating ESG criteria into the legal-administrative logic—without renouncing legality, impersonality and transparency—this model gives effectiveness to the 1988 constitutional project: to use public spending not only to acquire goods and services, but to produce, with probity and efficiency, a development that is simultaneously economically, socially and environmentally sustainable.

2 DIMENSIONS OF DEVELOPMENT AND SUSTAINABLE PUBLIC PROCUREMENT

The concept of sustainable development, by inseparably integrating the environmental, social and economic dimensions, has become the foundation for the reconfiguration of public procurement in Brazil. The country has developed one of the most comprehensive normative frameworks in the world for this purpose, in a process that was consolidated progressively. Law No. 12.349/2010 inaugurated a paradigm shift by amending Law No. 8.666/1993, including national sustainable development as an objective of bidding processes.

Decree No. 7.746/2012 deepened this perspective by establishing specific criteria and practices, creating the Inter-Ministerial Commission on Sustainability in Public Administration (CISAP). Normative Instruction SLTI/MP No. 01/2010, in turn, was pioneering in making the inclusion of environmental criteria mandatory in the technical specifications of all federal

contracts, anticipating what the New Law on Bidding and Contracts (Law No. 14.133/2021) would come to enshrine by elevating sustainability to the condition of a fundamental principle (Art. 5) and strategic objective (Art. 11, IV) of contractual activity. As Marçal Justen Filho aptly observes,

Law No. 14.133/2021 represents a regulatory milestone that not only updates the regime of administrative contracting but, above all, promotes sustainability to the legal level of a structuring principle, binding State activity to purposes of economic and socio-environmental development that transcend the merely procedural logic. (JUSTEN FILHO, 2022, p. 115).

This normative framework was recently expanded by Decree No. 11.890/2024, which created the Inter-Ministerial Commission on Public Procurement for Sustainable Development (CICS), significantly strengthening the institutional capacity of the State. The decree provides for preference margins of up to 10% for national products and up to 20% for innovation-based products, in addition to establishing criteria for the acquisition of recycled, recyclable or biodegradable goods.

Decree No. 11.890/2024 regulates Article 26 of Law No. 14.133/2021 and institutes the Inter-Ministerial Commission on Public Procurement for Sustainable Development (CICS), conceiving it as a governance unit devoted to the strategic use of State demand, with competences to propose and decide on preference margins (normal and additional), compensatory measures and sustainability criteria, among other instruments (Arts. 1, 7 and 8). Portal da Câmara dos Deputados. In operational terms, the decree sets a normal preference margin of up to 10% for national manufactured goods and services (compared to foreign ones) and, for the first time, extends the logic to recycled, recyclable or biodegradable goods; the additional margin, applicable to national goods/services resulting from technological development and innovation in the country, may be added to the normal one, subject to the ceiling of 20% (Art. 3, caput and § 1 in conjunction with Art. 2, I and II).

The act also provides for federative adherence: States, the Federal District, Municipalities and other Branches may adopt the margins defined by the federal Executive (Art. 3, § 4), which reinforces the inducing capacity of public purchasing power by expanding the scale and predictability of the policy. Portal da Câmara dos Deputados. This design executes the legal command of Article 26 of Law No. 14.133/2021, which authorizes margins for (i) national manufactured goods and services that meet Brazilian technical standards and (ii) recycled, recyclable or biodegradable goods, leaving to the federal regulation the definition of parameters and limits. Portal da Câmara dos Deputados. In interpretive reinforcement, the

TCU systematizes that the additional margin (innovation) accumulates with the normal one up to a maximum of 20%, consolidating the reading adopted by the Decree.

On the level of the manager's duties, Opinion No. 01/2021/CNS/CGU/AGU established the obligation to insert sustainability criteria and practices in all phases of contracting (planning, supplier selection, execution and oversight) and determined that non-adoption must be expressly justified in the records, with reasons of fact and/or of law—guidance that has been reiterated in official guides. *Serviços e Informações do Brasil*. Such an opinion dialogues with the constitutional-legal framework and with the guideline that sustainable bidding is the rule, whereas its waiver requires qualified justification. As Juarez Freitas observes:

The Public Administration, at all its levels, not only may but must exercise its purchasing power as an instrument to induce sustainable standards of production and consumption, so as to fulfil the constitutional duties of environmental protection, social justice and economic development. The rule is the adoption of sustainability criteria in all phases of contracting; the exception, duly justified, is their non-application. The public manager who omits this duty incurs a violation of the principle of efficiency and, even more, an affront to the Constitution itself, which requires of the Administration choices oriented toward the promotion of the common good in an intergenerational perspective” (FREITAS, 2016, p. 89).

Moreover, the Nova Indústria Brasil (NIB/2024) made explicit the use of public procurement as an instrument of industrial policy, and the government announcement of 22.01.2024 recorded, indeed, the signing of the decrees that create the CICS and define preference margin criteria for national goods/services and for recycled/recyclable/biodegradable goods, integrating the neo-industrialization policy into innovation and ecological transition strategies. *Serviços e Informações do Brasil*. The framework was refined by Decree No. 12.218/2024, which amended Decree No. 11.890/2024 and detailed attributions and references to the CICS resolution for the specification of eligible items, preserving the percentages and the logic of application.

In this same spirit, CGU Opinion No. 01/2021 made the adoption of sustainability criteria mandatory, imposing on the manager the duty to expressly justify their non-application. More recently, the integration of sustainable contracting into the Nova Indústria Brasil (2024) policy came to position the State's purchasing power as a strategic instrument of industrial policy and sustainable development.

The environmental dimension of public procurement is translated into specific and measurable criteria. It establishes, for example, the mandatory nature of energy efficiency, with the use of LED lamps and automation systems by presence sensors, as well as the

adoption of individualized consumption metering. Waste reduction becomes an essential requirement, imposing separation at the source, allocation to waste-picker cooperatives, pursuant to Decree No. 5.940/2006, and the use of recycled aggregates whenever available. Further required is the use of renewable, recycled, non-toxic and biodegradable materials, in conformity with ABNT NBR 15448, in addition to proof of the sustainable origin of wood and the prioritization of locally produced inputs.

The carbon footprint emerges as a tie-breaking criterion in bidding processes, valuing companies that demonstrate effective mitigation, in accordance with the National Policy on Climate Change. In this context, certifications such as ISO 14001 (environmental management), LEED and AQUA-HQE (sustainable buildings), FSC (timber products) and INMETRO (energy efficiency) are incorporated as validation elements, alongside objective performance indicators, such as energy consumption (kWh/m²), water consumption (litres/m²), the percentage of recycled materials used and CO₂-equivalent emissions.

The social dimension², in turn, aims at inclusion and dignity at work. It requires the provision of personal protective equipment, the delivery of sustainability training within the first three months of the contract, and full compliance with labour legislation. The Quota Law (Law No. 8.213/1991) imposes the reservation of 2% to 5% of jobs for persons with disabilities, depending on the size of the company, while gender-equality and non-discrimination policies become recurrent requirements. Support for micro and small enterprises is also guaranteed, in accordance with Complementary Law No. 123/2006, through differentiated treatment and specific preference margins. Certifications such as SA8000 and ABNT NBR 16001 attest to social responsibility, adding to those of accessibility and safety at work. Among the relevant social indicators are the percentage of employees with disabilities, the rate of work accidents, the diversity and inclusion index, the participation of ME/EPP in contracts and the level of worker satisfaction.

In the economic sphere, sustainability manifests itself through the logic of long-term value, by means of the full life-cycle analysis of the goods and services contracted. This assessment goes beyond the initial acquisition price to consider costs of use, maintenance, disposal and environmental externalities. The total cost of ownership (TCO) perspective strengthens the pursuit of long-term economy, while the local economic development policy

² The social dimension of sustainability in public and private procurement refers to the set of practices that promote social justice, labor rights and the inclusion of historically marginalized groups. This involves compliance with legal obligations, such as the Quota Law (Law No. 8,213/1991), which mandates the hiring of persons with disabilities, and the observance of standards that ensure decent working conditions, equal opportunities and support for small businesses. Certifications such as SA8000 (focused on social responsibility in the workplace) and ABNT NBR 16001 (aimed at social responsibility management) function as seals of good practices. The indicators mentioned allow assessing the social impact of contracts and the effectiveness of the policies adopted.

privileges regional suppliers, generates jobs and strengthens the national production chain. In addition, innovation criteria are incorporated, rewarding investments in research and development, the adoption of clean technologies and sustainable solutions. Within this framework, cost-benefit analysis comes to incorporate not only financial aspects, but also environmental and social costs, reinforcing the return on sustainable investment.

In a complementary manner, emerging dimensions have been incorporated into the concept of sustainability in public procurement³. Cultural sustainability orients the protection of historical heritage and the appreciation of local traditions; institutional sustainability⁴ strengthens governance, transparency and social participation; and technological sustainability promotes the adoption of clean technologies, the transfer of knowledge and the fight against planned obsolescence.

Sustainable development, when applied to public procurement, comes to demand an administrative action guided by good faith, legality and efficiency, breaking with the mechanistic thinking that reduced the bidding process to the pursuit of the lowest price. This view proves insufficient in the face of the constitutional mandate of national sustainable development, which requires effective results in the promotion of social justice, environmental preservation and economic balance. In this sense, as Maria Sylvia Zanella Di Pietro recalls:

The administrative contract cannot be understood as a mere formal arrangement intended to meet the immediate needs of the Administration. It is embedded in the realization of public purposes and, therefore, must be interpreted as an instrument for the realization of constitutional values. In the current context, the principles of efficiency, legality and good faith must be read in the light of the requirement of sustainability, so that the bidding procedure and the contractual execution are oriented not only toward the lowest price, but toward the most advantageous result in social, environmental and economic terms (DI PIETRO, 2022, p. 231).

In this sense, the administrative contract ceases to be an isolated act and comes to be configured as a genuine instrument of public policy, forming part of the structure of State governance. In the different phases of contracting—planning, selection of proponents and contractual execution—sustainability becomes a parameter of assessment. In planning,

³ On the cultural dimension as a vector of development and heritage protection: see CF/1988, art. 216 (protection of Brazilian cultural heritage) and the UNESCO Convention for the Safeguarding of the Intangible Cultural Heritage (2003) and the Convention on the Protection and Promotion of the Diversity of Cultural Expressions (2005), incorporated into Brazilian law. Cf. BRASIL. Constitution (1988). Art. 216; UNESCO. Convention for the Safeguarding of the Intangible Cultural Heritage, 2003; UNESCO. Convention on the Protection and Promotion of the Diversity of Cultural Expressions, 2005.

⁴ Regulatory framework of public governance and its connection with procurement: Decree No. 9,203/2017 (Federal Public Administration Governance Policy) and Law No. 14,133/2021, arts. 5 (principles) and 11 (objectives), which integrate efficiency, transparency and results into the procurement regime. Cf. BRASIL. Decree No. 9,203, of Nov. 22, 2017; BRASIL. Law No. 14,133, of Apr. 1, 2021, arts. 5 and 11.

market analysis and the definition of socio-environmental conditioning factors are required; in selection, judgment criteria aligned with national sustainable development are employed; and, in execution, continuous monitoring of the fulfilment of socio-environmental goals is implemented.

This process also imposes the centrality of integrity as a constitutive element of sustainable public procurement. Institutional integrity corresponds to the commitment to ethical standards, transparency and the fight against corruption, which becomes even more relevant in the face of the complexity and legal risks added by sustainability. In this context, the integration of compliance mechanisms, documentary control and auditing reduces fraudulent practices, strengthens trust and ensures the effectiveness of environmental and social conditioning factors. A robust integrity system guarantees publicity, prevents conflicts of interest and unlawful steering, and expands control, both internal and external, becoming an essential condition for the reliability and legitimacy of sustainable public procurement.

2.1 THE STATE AS AN AGENT OF DEVELOPMENT: THE PURCHASING ENTITY AND THE PROMOTION OF SUSTAINABILITY AND INTEGRITY

The Brazilian State assumes, in the 1988 constitutional design, a function that transcends the mere regulation of social relations to configure itself as an active protagonist of national development. This transformative vocation is inscribed unequivocally in Article 3 of the Federal Constitution, which establishes as fundamental objectives of the Republic the construction of a free, just and solidary society, the guarantee of national development, the eradication of poverty and the reduction of social and regional inequalities. As Eros Roberto Grau observes:

The economic order is not limited to imposing negative restrictions on the market, but translates a normative project that assigns to the State an active role in shaping social and economic reality. The 1988 constitutional text inserts national development, social justice and the defence of the environment as purposes that bind all State action, especially economic activity. It is, therefore, a system of binding vectors that require of the State an inducing and transforming behaviour, compatible with the centrality of its function as a normative agent and regulator of economic activity (GRAU, 2010, p. 213).

This normative architecture does not represent a mere declaration of programmatic intentions, but establishes binding vectors that must orient all State action, especially in the exercise of its purchasing power, which moves approximately 15% of the national Gross Domestic Product.

The constitutional economic order, delineated in Article 170, reinforces and specifies this transformative mandate by establishing that economic activity, founded on the

valorization of human labour and on free enterprise, has the purpose of ensuring for all a dignified existence, in accordance with the dictates of social justice. The principles of the social function of property, of the reduction of regional and social inequalities, and of the defence of the environment—the latter qualified by differentiated treatment according to the environmental impact of products and services—do not constitute mere limitations on the exercise of economic activity, but positive guidelines that must be actively promoted by the State in all its manifestations, particularly through its public procurement.

The strategic role of the State as the largest single buyer in the Brazilian economy confers upon it a power of behavioural inducement that no traditional regulatory policy would be capable of achieving with the same effectiveness.⁵ When the public power establishes sustainability criteria in its bidding processes, it is not merely buying environmentally adequate products or services; it is signalling to the entire market a direction of development, creating demand at scale for sustainable products, incentivizing technological innovation and altering the very cost structure of the economy.⁶ As Teresa Villac Pinheiro Barki observes, “the State, by exercising its purchasing power with sustainability criteria, transforms itself into a vector of cultural and economic change, inducing practices that transcend the specific object of the contract to permeate the entire national production fabric.”

The transition from the bureaucratic-formalist model to a results-oriented paradigm represents one of the most profound transformations in contemporary Brazilian administrative law. Article 11, item IV, of Law 14.133/2021, by establishing as an objective of the bidding process “to ensure the selection of the proposal apt to generate the most advantageous contracting result for the Public Administration, including with respect to the life cycle of the object”, definitively breaks with the procedural logic that historically characterized Brazilian public procurement.⁷ It is no longer a matter of following bureaucratic rituals with formal perfection, but of achieving concrete results that add public value and contribute to the attainment of constitutional objectives.

This paradigm shift finds a powerful synthesis in the assertion of Camelo and Nóbrega (2024): “Democracy has to work”. The phrase, in its apparent simplicity, encloses a profound critique of the sterile formalism that for decades characterized Brazilian public administration. It is not enough for procedures to be formally legal; it is imperative that they produce effective

⁵ The specialized literature and OECD reports show that public procurement spending accounts, on average, for 12% to 15% of countries' GDP, granting the State undeniable power of economic and social inducement.

⁶ This multiplier effect is also highlighted by the TCU, which treats sustainable procurement as a public policy instrument capable of reordering markets and encouraging innovation.

⁷ BRASIL. Law No. 14,133, of April 1, 2021. Public Procurement and Administrative Contracts Law. Diário Oficial da União: section 1, Brasília, DF, Apr. 01, 2021. Available at: https://www.planalto.gov.br/ccivil_03/_ato2019-2022/2021/lei/L14133.htm. Accessed on: Sept. 23, 2025.

results, that they deliver value to society, that they transform public resources into collective well-being. Legality, in this context, ceases to be an end in itself to become an instrument at the service of effectiveness. As the authors complement, “the legitimacy of the contemporary State does not derive solely from the formal fulfilment of norms, but from its capacity to deliver results that concretely improve the lives of citizens.”

The challenge of this transition of thought lies precisely in overcoming a secular administrative culture, forged under the aegis of patrimonialism and formalism as a mechanism of defence against corruption and arbitrariness. Public managers, trained in a tradition that values process over result, face the dilemma of assuming calculated risks in the name of effectiveness without compromising administrative probity. As Diogo de Figueiredo Moreira Neto points out:

The transition from bureaucratic administrative law to the administrative law of effectiveness demands not only normative adjustments, but a genuine cultural change in the Public Administration. The public interest can no longer be interpreted as a static and fragmented concept; it reveals itself as dynamic, intertemporal and systemic, requiring public managers to consider the impacts of their choices in multiple dimensions—economic, social and environmental—and across multiple temporal horizons. This reconstruction of the public interest, in a holistic key, is an indispensable condition for the State to fulfil its constitutional function as an agent of sustainable development” (MOREIRA NETO, 2016, p. 47).

Control bodies, in turn, are faced with the need to develop new assessment metrics that capture not only procedural compliance, but the real impact of public procurement on sustainable development indicators.

The operationalization of the State as an agent of sustainable development through public procurement is faced with structural obstacles that cannot be minimized. The first of these is the decisional fragmentation of the Administration, in which bodies and entities pursue sectoral objectives without measuring the systemic and intertemporal effects of their choices—including negative externalities that, although invisible to the contracting centre, burden the public treasury in other public policies or impact society as a whole⁸. Overcoming this scenario is not exhausted in administrative coordination: it requires a legal reconstruction of the public interest in a holistic and intertemporal key, compatible with the fundamental objectives of the Republic (Art. 3, CF/1988), with the principles of the economic order (Art. 170, caput and VI) and with the fundamental right to the environment (Art. 225), so as to

⁸ BRASIL. Federal Court of Accounts. Referencial de Governança para o setor público. Brasília: TCU, 2014 (subsequent updates). See also: SUNDFELD, Carlos Ari. *Direito Administrativo para Céticos*. 2nd ed. São Paulo: Malheiros, 2017

orient purchasing power toward the maximization of public value in the life cycle of the contracted object.

Next, the tension between standardization and flexibility emerges. If, on the one hand, standardizing specifications, judgment criteria and executive clauses reduces transaction costs, generates scale and raises legal certainty, on the other, adaptation to local and sectoral realities is a condition of the effectiveness of sustainable development: what is optimal for a metropolis may be inefficient or disproportionate in a small municipality.⁹ Law No. 14.133/2021 densifies this balance by positivizing sustainability as a principle (Art. 5) and objective of the bidding process (Art. 11, IV), opening space for judgment criteria oriented toward performance, innovation and life-cycle analysis (LCC/TCO), without abdicating isonomy and competitiveness. The literature on public governance and the TCU Governance Framework converge toward this design: standardize what pertains to management and make flexible what pertains to result, with verifiable indicators and risk management.

Technical capacity-building is a critical variable of this arrangement. The assessment of proposals from the standpoint of sustainability and added public value presupposes competences that transcend the strictly legal: life-cycle analysis, carbon footprint, circular economy, social metrics and methods of measurement and verification (M&V). As Juarez Freitas warns, the multidimensional sustainability of contracting demands interdisciplinary training of public agents, integrating legal, economic, environmental and social knowledge, oriented toward the common good. At this point, technical standards (e.g., ISO 20400 – Sustainable Procurement and ISO 14001 – Environmental Management Systems) and the Brazilian infra-legal record (Decree No. 7.746/2012; Normative Instructions on sustainable procurement) provide objectively auditable methodological roadmaps.

Finally, cultural resistance to change—expressed in risk aversion and in the reflex of the “lowest price” as a safe harbour—constitutes a real obstacle. The fear of personal accountability still induces defensive choices, even when there are more advantageous proposals on a life-cycle basis. The legal order, however, protects responsible technical discretion: the LINDB (Arts. 20, 22 and 28), reinforced by Decree No. 9.830/2019, requires consequentialist reasoning, prohibits abstract control decisions and establishes that the agent is only personally liable for fraud or gross error, which stimulates decisions qualified by evidence, and not immobilism. The risk matrix—consolidated in Brazilian law since Law No. 11.079/2004 (Art. 5, III) and disseminated in contracting in general—, allied to integrity programmes (required in large-scale contracts by Law No. 14.133/2021, Art. 25, § 4), aligns

⁹ CAMINHA, Ubirajara; and VILLAC, Teresa (eds.). *Contratações Públicas Sustentáveis*. Brasília: IPEA/CGU, 2012. (They highlight a regulatory design that allows contextual solutions without breaching equal treatment).

incentives, reduces uncertainties and mitigates litigiousness, making legally viable an action oriented toward results and sustainable public value.

Paradoxically, it is precisely in the conscious and reasoned exercise of discretion that the possibility of transformation resides. The choice among different proposals that meet the minimum requirements of the notice, privileging the one that best contributes to the objectives of sustainable development, does not constitute arbitrariness, but the legitimate exercise of the administrative function oriented by constitutional principles¹⁰. As Marçal Justen Filho sustains, “administrative discretion, when exercised on the basis of technical criteria and oriented by constitutional principles, is an indispensable instrument for the realization of the public interest in its contemporary acceptance.”

The role of the State as an agent of sustainable development materializes in a particularly eloquent manner in large-scale contracts, where the impact of public choices reverberates throughout the entire production chain.¹¹ The construction of an infrastructure work, for example, should not be assessed only by its direct cost and immediate functionality, but by its potential to induce regional development, generate qualified jobs, transfer technology and minimize environmental impacts.¹² This holistic vision demands a revolution in the methods of planning and assessment of public procurement, replacing the one-dimensional analysis of price with the multidimensional assessment of value.

International experience offers valuable lessons on the transformative potential of sustainable public procurement. Countries such as South Korea and Germany demonstrate that the strategic use of State purchasing power can accelerate the transition to a low-carbon economy, stimulate technological innovation and reduce regional inequalities. However, as Carlos Ari Sundfeld warns, “the uncritical importation of foreign models ignores the specificities of the Brazilian context, marked by profound inequalities and territorial diversity that demand its own creative solutions.”¹³

The consolidation of the State as an agent of sustainable development, through its capacity to contract and to discipline markets via purchasing power, represents, in the final analysis, the very teleological realization of the 1988 constitutional project. It is not a matter of episodic adherence to managerial fads, nor of administrative voluntarism; it is a legal-

¹⁰ Contemporary doctrine emphasizes that discretion has ceased to be a space for arbitrariness and has come to be delimited by constitutional principles, especially efficiency, legality and sustainability.

¹¹ The Federal Court of Accounts (TCU) has already recognized that high-value contracts must be planned in order to generate positive externalities, such as innovation, regional development and environmental sustainability.

¹² This understanding is aligned with art. 11, IV, of Law No. 14,133/2021, which introduces the criterion of life cycle analysis of the object as part of the advantagefulness of the contract.

¹³ SUNDFELD, Carlos Ari. *Direito administrativo para céticos*. 4th ed. São Paulo: Malheiros, 2020. Available at: <https://www.editoramalheiros.com.br/produto/direito-administrativo-para-ceticos/>. Accessed on: Sept. 23, 2025.

constitutional imperative that emanates, simultaneously, from the fundamental objectives of the Republic (reduction of inequalities, promotion of national development, construction of a free, just and solidary society) and from the principles of the economic order (valorization of labour, free enterprise, social function and sustainable development), in addition to the fundamental right to the ecologically balanced environment as a good of common use of the people and essential to a healthy quality of life.

From this perspective, contractual activity ceases to be seen as a bundle of isolated bureaucratic acts and comes to be understood as public policy in action, which must be planned, instructed, judged and executed in a manner coherent with the effectiveness of results required by the Constitution and by Law No. 14.133/2021—this, in turn, positivizing sustainability as a principle (Art. 5) and advantageousness by life cycle as an objective of the bidding process (Art. 11, IV).¹⁴

Indeed, democracy that works—paraphrasing the contemporary critique of sterile formalism—is the one that transforms legality into measurable public value, through decisions motivated by evidence, analysis of intertemporal costs and benefits, internalization of externalities and optimal allocation of risks. State purchasing power appears, in this context, as an economic-legal instrument of exceptional inducing potential: by structuring notices with sustainable technical specifications, performance-based judgment criteria and contractual integrity obligations, the State signals shadow prices, alters incentive structures and reorganizes production chains, producing results that pure ex ante regulation could hardly achieve with equal capillarity, allocative efficiency and democratic legitimacy. For this reason, advantageousness is not to be confused with the “lowest nominal price”; the calculation of the total cost of ownership (TCO) and of life-cycle analysis (LCC) is imposed, compatible with the economics of public contracting and with international best practices (OECD/European Union/ISO 20400), as well as with the governance by indicators advocated by the TCU.

The LINDB—as worded by Law No. 13.655/2018—reinforces this paradigmatic shift by requiring consequentialist reasoning (Art. 20), assessment of the practical impacts of administrative and control decisions (Art. 21), gradation of sanctions and the duty to consider the circumstances of the case (Art. 22), in addition to establishing that the public agent is not liable for mere reasonable interpretation and only for fraud or gross error (Art. 28). Far from

¹⁴ As Ronny Charles Lopes de Torres states: Public procurement, especially after the enactment of Law No. 14,133/2021, can no longer be understood as merely bureaucratic administrative procedures or as isolated acts of the Administration. On the contrary, it must be viewed as genuine public policies in execution, capable of inducing economic and social behaviors, promoting innovation, protecting the environment and realizing constitutional values. The bidding process ceases to be an end in itself and comes to constitute a means to achieve results that represent the maximization of public value, which requires integrated planning, adequate preparation and constant monitoring of contract execution (TORRES, 2022, p. 87).

stimulating recklessness, this regime protects responsible technical discretion, disincentivizes irrational risk aversion and frees decisional capacity so that the manager may opt for more advantageous solutions in the life cycle—even if they are not those of the lowest immediate price—provided they are duly reasoned, proportionate and auditable. The Governance Policy of the Federal Public Administration (Decree No. 9.203/2017), alongside Decree No. 9.830/2019 (which regulates provisions of the LINDB), converges toward robust planning, risk management, active transparency and accountability as conditions of the legitimacy of public spending.

Within this framework, integrity is not a bureaucratic appendage, but a condition of possibility of the model. Law No. 14.133/2021, by admitting/requiring integrity programmes in large-scale contracts (Art. 25, §4), institutionalizes¹⁵ the alignment of incentives between the Administration and private parties, reduces information asymmetries, mitigates legal-reputational risks and strengthens the legitimate trust indispensable to cooperative execution. In parallel, the risk matrix—of inspiration consolidated in the PPP Law (Art. 5, III) and disseminated in the general regime—objectifies responsibilities, establishes rebalancing triggers and distributes risks to those who can best manage them, increasing contractual efficiency and reducing litigation and opportunistic amendments. When associated with verifiable metrics (environmental, social, governance and economic), with performance-based payments (*bonus-malus*) and with independent auditing, such tools operationalize the constitutional promise of sustainability and good administration.

2.2 THE ENTERPRISE AS A STRATEGIC PARTNER IN THE GENERATION OF PUBLIC VALUE

The relationship between State and enterprise in public procurement is going through a moment of profound re-signification, marked by the definitive overcoming of the reductionist logic of the lowest price as the predominant decisional criterion.¹⁶ This paradigmatic transformation reflects the institutional maturing that recognizes in the enterprise not a mere supplier subordinated to State designs, but a strategic partner in the construction of public value. The valorization of ESG (Environmental, Social and Governance) criteria and of corporate social responsibility emerges as a structuring element of this new contractual architecture, where the metric of success transcends the immediate economy of resources

¹⁵ Article 37, caput, of the Federal Constitution of 1988 requires the Public Administration to respect the principles of legality, impersonality, morality, publicity and efficiency, which were expanded by the new Procurement Law to encompass sustainability as an interpretive vector.

¹⁶ Contemporary Administrative Law literature has emphasized that the focus on "lowest price" compromises the efficiency and advantageousness of the contract, out of step with the constitutional objectives of sustainable national development.

to encompass the systemic impact of the contract on the socio-economic and environmental fabric.¹⁷

This evolution finds its most forceful normative expression in Article 25, §4, of Law 14.133/2021, which establishes the requirement of integrity programmes for large-scale contracts. Such a provision represents more than an additional bureaucratic imposition; it is configured as legal recognition that corporate integrity constitutes an element inseparable from good contractual execution and, by extension, from the very legitimacy of the public-private partnership. The integrity programme, in this context, operates as a mechanism for alignment between public values and business practices, creating a zone of ethical convergence where private interest and the common good not only coexist, but mutually reinforce one another.¹⁸ The legal requirement induces companies to internalize controls and practices that, in protecting the Public Administration from deviant conduct, simultaneously strengthen the enterprise's own sustainability in the long term.

Expectations of business conduct in the new ecosystem of public procurement expand to encompass three fundamental and interdependent dimensions: ethics, innovation and sustainability.¹⁹ The ethical dimension transcends the mere formal fulfilment of contractual obligations to require a proactive posture of transparency, accountability and commitment to republican values. Innovation ceases to be an optional competitive differential to become a requirement for qualified participation in the public market, demanding from companies the capacity to propose creative solutions to the complex challenges of the contemporary Administration. Sustainability, in turn, consolidates itself as a transversal criterion that permeates from the conception of products and services to the methods of production and the relations with the supply chain, reflecting the constitutional imperative of national sustainable development.

The concept of the “citizen enterprise” emerges in this context as a synthesis of this new corporate identity demanded by the public market. It is not a rhetorical figure or an institutional marketing strategy, but a legal-administrative recognition that the enterprise, in contracting with the State, assumes co-responsibility for the attainment of public objectives. As Juarez Freitas points out:

¹⁷ Recent studies show that ESG criteria already impact investment decisions and trust in the private sector, a phenomenon that is also reflected in contractual relations with the public authorities (OECD, 2020).

¹⁸ In this regard, the doctrine of Floriano de Azevedo Marques emphasizes that integrity is a constitutive vector of contractual legitimacy, insofar as it ensures convergence between public values and private practices.

¹⁹ This triad of ethics–innovation–sustainability has been internationally recognized as a central criterion for strengthening strategic public procurement.

The contemporary enterprise, especially that which contracts with the Public Power, cannot restrict itself to the logic of immediate profit, nor to the merely formal fulfilment of its contractual obligations. It is called to assume a citizen identity, understanding that its economic success is inextricably linked to the promotion of the sustainable development of the collectivity. The so-called 'citizen enterprise' emerges as a subject co-responsible for the realization of fundamental rights, and must structure itself in practices of ethical governance, in policies of corporate social responsibility and in consistent environmental strategies. It is a revolution in the theory of the enterprise, whereby the maximization of private value is only legitimated when linked to the maximization of public value, in an intergenerational perspective (FREITAS, 2019, p. 211).

The citizen enterprise is characterized by the understanding that its economic success is intrinsically linked to the development of the society in which it operates, by the adoption of governance practices that mirror the principles of public administration, and by the commitment to the generation of positive externalities that extrapolate the specific contractual object. This conception implies a revolution in the very theory of the enterprise, which comes to incorporate into its decisional core considerations traditionally alien to pure mercantile logic.

The operationalization of this new paradigm faces, naturally, significant tensions and challenges. The valorization of ESG criteria and of social responsibility frequently implies additional costs that, in a superficial analysis, could appear contrary to the principle of economy. However, the sophisticated understanding of this principle, aligned with the modern jurisprudence of the courts of accounts, recognizes that true economy must consider the total cost of ownership (Total Cost of Ownership - TCO) and the externalities generated by the contract. A company that offers products with greater durability, lesser environmental impact and that generates local jobs may present a proposal with a higher nominal price, but deliver significantly greater public value when all the direct and indirect impacts of the contract are considered. As Floriano de Azevedo Marques Neto highlights:

It is no longer possible to understand the bidding process as a ritual of observance of forms and deadlines, detached from the realization of concrete public purposes. The attachment to formalism, still so present in Brazilian administrative culture, needs to yield space to a conception of public contracting as an instrument for the promotion of results, in which the criterion of the lowest price ceases to be absolute and gives way to the multidimensional analysis of the most advantageous proposal. This change imposes new competences on the public manager, who must be capable of assessing social, environmental and economic impacts, and equally challenges the control bodies to develop more sophisticated assessment methodologies, apt to measure the effective public value generated by the contract (MARQUES NETO, 2019, p. 57).

The cultural transformation underlying this paradigmatic change cannot be underestimated. Public managers, historically conditioned to privilege the lowest price as a safeguard against questioning by control bodies, need to develop new competences to assess multidimensional proposals. Companies accustomed to competing exclusively via price must restructure their business models to genuinely incorporate the values of sustainability and social responsibility. The control bodies themselves face the challenge of developing auditing methodologies that capture the complexity of this new reality, overcoming sterile formalism in favour of a substantive analysis of the public value generated.

The integrity programme required by Law 14.133/2021 functions as a catalyst of this transformation, establishing a minimum level of corporate governance that gradually raises the standard of the supplier market. Companies that initially see such a requirement as a bureaucratic obstacle progressively discover that the structuring of robust compliance systems not only qualifies them to contract with the public power, but also increases their competitiveness in the private market, reduces costs with litigation and contingencies, and attracts investors increasingly attentive to ESG criteria. Thus, a virtuous circle is created in which the public requirement induces private improvements which, in turn, raise the quality of public procurement.

The consolidation of the enterprise as a partner in the generation of public value represents, in the final analysis, the maturing of a systemic vision of public procurement.²⁰ The artificial dichotomy between public and private is overcome to recognize that, in a complex and interdependent economy, the success of one depends inexorably on the success of the other.²¹

The citizen enterprise is not the one that abdicates its profit objective, but the one that understands that the sustainable maximization of shareholder value necessarily passes through the creation of shared value with society.²² The State, in turn, abandons the posture of authoritarian buyer to assume the role of orchestrator of an ecosystem where different

²⁰ The idea of a strategic partnership between the State and companies reflects the advancement of a contemporary conception of public governance, which shifts the focus from mere formalist control to the pursuit of concrete results. In this model, public procurement ceases to be seen as an isolated act and comes to be understood as public policy in action, converging with international recommendations from the OECD and the European Union on *public procurement for innovation*.

²¹ Justen Filho notes that administrative contracts, under the regime of Law No. 14,133/2021, take on the role of inducing desirable economic and social behaviors, overcoming the old dichotomy between private efficiency and public purpose. The institutional economics literature also corroborates this view, showing that cooperative interaction between the State and the market tends to generate better sustainable development outcomes.

²² The concept of the "corporate citizen", developed by Juarez Freitas, conveys the notion that the modern corporation must align its economic performance with the constitutional objectives of social justice and environmental protection. This means that profit ceases to be an absolute end and becomes a means of generating shared value, internalizing positive externalities and mitigating negative impacts on the social and environmental fabric.

actors contribute, each with its specific competences, to the attainment of the common good. Floriano de Azevedo Marques Neto highlights that the State, in exercising its purchasing power, must act as an “inducer and orchestrator of a governance ecosystem”, and not as a mere centralizing buyer. This dialectical synthesis between private efficiency and public purpose configures the promising horizon of public procurement in the 21st century.

Reports from the World Bank (2021) and the OECD (2020) recognize that sustainable contracting, associated with programmes of integrity, innovation and social responsibility, configures one of the main agendas of administrative reform in the 21st century. The wager on a dialectical model, combining private efficiency and public purpose, is pointed out as essential to confront global challenges such as climate change, social inequalities and digital transformation. In this scenario, public procurement ceases to be a mere administrative function to consolidate itself as a structuring instrument of global governance, capable of redefining standards of production and consumption, strengthening economic democracy and ensuring the effectiveness of fundamental rights on an intergenerational scale.

3 FINAL CONSIDERATIONS

The consolidation of an ecosystem of sustainable public procurement demands the affirmation of a legal-administrative rationality that overcomes the traditional command-and-control model—centred on procedural formalism—and reconducts it to the logic of collaborative governance, results-based management and accountability. In the light of the 1988 Constitution, public procurement ceases to be an end in itself to become an instrument for the realization of constitutional objectives and rights: (i) the fundamental objectives of the Republic (Art. 3), (ii) the economic order founded on social justice and national sustainable development (Art. 170, caput and VI), (iii) the fundamental right to the ecologically balanced environment (Art. 225) and (iv) the principles of public administration (Art. 37, caput), with emphasis on legality, impersonality, morality, publicity and efficiency.

Within this framework, Law No. 14.133/2021 densifies the constitutional requirement by: (a) positivizing sustainability as a principle (Art. 5) and as an objective of the bidding process (Art. 11, IV); (b) linking the notion of advantageousness to life-cycle analysis and to the total cost of ownership (TCO); and (c) requiring, in large-scale contracts, the institution of integrity programmes as a condition of eligibility and of contractual execution (Art. 25, § 4). Integrity, therefore, is not a compliance adornment: it is a structuring principle of the legal regime of contracting and an element of the practical validity and democratic legitimacy of public spending.

From this arise three central legal propositions. (i) Finalistic constitutionalization of public procurement: bidding processes and contracts are means to deliver public value and to internalize environmental, social and economic externalities, the isolated criterion of the “lowest price” no longer being acceptable when it contravenes the useful result required by Art. 11 of Law No. 14.133/2021. Advantageousness acquires a material and measurable content (LCC/TCO, performance, innovation), compatible with the duty of good administration. (ii) Integrity as a condition of legitimacy and efficiency: public and corporate integrity reduces informational asymmetries, mitigates risks (legal, reputational, socio-environmental) and protects legitimate trust. On the contractual level, it must integrate: a) a risk-allocation matrix (identification, treatment and optimal apportionment); b) performance-based clauses; c) monitoring and auditing with verifiable indicators; and d) proportionate sanctions (including bonus-malus mechanisms), so as to align incentives and responsibilities. (iii) Public-private co-responsibility under collaborative governance: the State exercises a dual role—regulator (defining requirements, metrics and controls) and exemplar (implementing public compliance, internal controls, accountability and active transparency). It falls to companies to internalize ESG standards, maintain integrity programmes proportionate to risk, manage the supply chain and innovate to maximize public value, leaving the position of mere supplier for that of institutional partner.

In operational terms, the administrative contract comes to be understood as public policy in action. Its essential elements include: (a) robust planning (technical studies, market analysis, definition of socio-environmental requirements and indicators); (b) judgment criteria adherent to sustainable development and technical quality; (c) a clear risk matrix, with objective allocation, rebalancing triggers and proportionate guarantees; (d) monitoring by environmental, social, integrity and economic indicators, with M&V and independent auditing; and (e) continuous accountability to control bodies and to society. This arrangement reduces litigiousness, qualifies public expenditure and generates intertemporal gains, including fiscal ones, by prioritizing value in the life cycle.

The analysis developed throughout this study reveals that the Brazilian public procurement system finds itself in a process of profound transformation, redefining the way in which State, companies and society interact in the contractual arena. It is not a matter of mere legislative updating: Law No. 14.133/2021 inaugurates a new legal structure that repositions integrity and sustainable development at the centre of the administrative contract, requiring not only normative compliance, but a genuine change of practices, mentalities and organizational cultures.

This transition, however, faces significant barriers. The logic still predominant in public administration values form to the detriment of result, preserving the primacy of the lowest price even in the face of proposals capable of generating broader social and environmental benefits. The fear of personal accountability, added to the political influence over technical decisions, reinforces such a conservative tendency and limits the reach of the advantageousness criterion in its complete acceptance. On the other side, control bodies remain concentrated on documentary verification, without sufficient instruments to assess the public value effectively delivered by contracting. As Maurício Tamer and Rodrigo Pironti observe, it is urgent to overcome the logic of reciprocal distrust between State and market and to substitute it with a relationship of cooperation oriented toward common objectives, in which the private sector is recognized as an indispensable cog for the realization of public policies.

The Brazilian State, which moves about 15% of the national GDP through its procurement, has an unparalleled inducing capacity to orient business practices, stimulate innovation and disseminate sustainable standards of production. However, this transformative power remains underused due to institutional fragmentation, the lack of integrated planning and technical deficiencies present both in the public sphere and in the private sector. The challenge is to build a shared mentality that aligns managers and companies with the realization of the constitutional objectives of sustainable development, combining efficiency and integrity as inseparable principles.

To consolidate the new model, three fronts of action stand out and connect to the legal design outlined above. The first is the creation of an environment of legal certainty that ensures backing for managers who innovate in a technical and reasoned manner, avoiding that risk aversion paralyse the administration. The second consists of investing in the interdisciplinary training of teams, expanding the capacity for dialogue with economics, the environment and the assessment of public policies, including with the use of data, indicators and verifiable goals. The third demands the recognition of companies as partners in the generation of public value, with effective monitoring systems that allow measuring the real impacts of contracting on social inclusion, environmental protection and economic efficiency.

The current context is favourable to change. The new legal framework, allied to the international pressure for sustainable practices and to the urgency of environmental and social challenges, creates conditions for real transformation. Comparative experience, however, demonstrates that legal reforms, without cultural changes and institutional strengthening, produce superficial effects. Success will be measured by the capacity to convert norms into verifiable results: reduction of emissions, inclusion of vulnerable groups

in the labour market, balanced regional development and strengthening of local and innovative production chains.

The construction of a sustainable and honest public procurement system is not a contingent choice, but a constitutional duty inscribed in Arts. 3 and 170 of the Constitution. National sustainable development, the reduction of inequalities and the defence of the environment constitute mandates that bind all State action and find in public procurement one of the most powerful instruments of realization. Law No. 14.133/2021, in dialogue with international commitments such as the 2030 Agenda—especially SDG 16—, traces the normative path for this transformation. It now falls to overcome resistances, invest in institutional capacity and cultivate the courage necessary to break with consolidated practices, assuming the risks inherent in administrative innovation.

In sum, to contract well is to govern well. The legal duty of integrity, sustainability and efficiency converts State purchasing power into a legitimate vector of national sustainable development, making the contractual ecosystem a space of co-responsibility and production of public value compatible with the 1988 Constitution and with Law No. 14.133/2021. More than a technical advance of administrative law, the articulation among State, business and integrity represents the reconfiguration of the very function of the contract as an instrument for the realization of constitutional values and the promotion of the common good. This is the promise inscribed in the new legal framework; the challenge—and the shared responsibility—is to transform it into everyday practice.

ABSTRACT

The article explores the application of SWOT analysis in Agtechs to identify strategies for growth and innovation. Using a qualitative methodology, the study evaluates strengths, weaknesses, opportunities, and threats in Brazilian agribusiness. The results highlight the importance of integrating innovative practices and improving technological processes to accelerate sustainable growth. It concludes that SWOT analysis is a decisive tool for the strategic direction of agricultural technology startups, promoting the transformation and modernization of the sector.

Keywords: Strategic Planning. Innovation. Sustainable Growth. Agricultural Technology.

RESUMO

O artigo explora a aplicação da análise SWOT em Agtechs para identificar estratégias de crescimento e inovação. Utilizando uma metodologia qualitativa, o estudo avalia forças, fraquezas, oportunidades e ameaças no agronegócio brasileiro. Os resultados destacam a importância de integrar práticas inovadoras e aprimorar processos tecnológicos para acelerar o crescimento sustentável. Conclui-se que a análise SWOT é uma ferramenta decisiva para o direcionamento estratégico das startups de tecnologia agrícola, promovendo a transformação e modernização do setor.

Palavras-chave: Planejamento Estratégico. Inovação. Crescimento Sustentável. Tecnologia Agrícola.

RESUMEN

El artículo explora la aplicación del análisis SWOT en Agtechs para identificar estrategias de crecimiento e innovación. Utilizando una metodología cualitativa, el estudio evalúa fortalezas, debilidades, oportunidades y amenazas en el agronegocio brasileño. Los resultados destacan la importancia de integrar prácticas innovadoras y mejorar los procesos tecnológicos para acelerar el crecimiento sostenible. Se concluye que el análisis SWOT es

1 INTRODUCTION

SWOT analysis is a widely used tool for evaluating the strengths, weaknesses, opportunities and threats of organisations and sectors, and it is extremely relevant to the current scenario of agricultural technology startups (agrotech). In Brazil, the significant growth of startups, driven from the 2000s onwards (GITAHY, 2011) and more intensely observed from 2018 onwards (ABSTARTUPS, 2022), highlights not only the diversification of business models – which vary between the Scalable, Small Business, Large Company, Lifestyle, Buyable and Social Startups categories (CONTAAZUL, 2016) – but also the need to understand the specific challenges and potentialities of each segment, especially that of Agtechs.

The Brazilian agricultural sector, which represents around 25.5% of GDP and benefits from unique conditions such as the high availability of arable land (CIEB, 2022; Rodrigues, 2006), has been incorporating innovations that permeate all the processes of the production chain, from genetic manipulation to the use of robotics and AI (WALTZ, 2017; MASSRUHÁ e LEITE, 2017). These technologies enable the integration and automation of agricultural processes, contributing to increased productivity and reduced costs, while at the same time mitigating environmental impacts and promoting operational efficiency.

In view of this scenario, the research problem to be investigated can be outlined as follows: how can the application of SWOT analysis contribute to the identification of growth and innovation strategies for Agtechs, considering the strengths present in the modernisation of Brazilian agribusiness and the threats and weaknesses arising from the structural and cultural limitations historically associated with entrepreneurship in the country? This question arises in a context in which Brazil, despite its innovative potential, has historically been marked by a restrictive view of entrepreneurship (GITAHY, 2011) and faces the challenge of competing with more developed ecosystems, such as that of the United States.

Based on the evidence presented, the hypothesis guiding this investigation proposes that the effective use of SWOT analysis will enable the structured identification of the strengths and opportunities inherent to Agtechs, making it possible to develop strategies that minimise weaknesses and threats and thus promote sustainable growth and the consolidation of innovation in the sector. This study will therefore seek to confirm whether the SWOT approach can be a decisive instrument in the strategic direction of agricultural technology startups, contributing to the transformation and modernisation of Brazilian agribusiness (Dutia, 2014).

In summary, the present research is grounded in the need to explore the benefits of SWOT analysis for the construction of innovative strategies in Agtechs, objectively identifying the elements that drive or restrict the development of the sector in the country.

2 LITERATURE REVIEW

The study by Ramos e Pedroso (2021) highlights the significant growth of agricultural technology startups in Brazil, demonstrating the innovative potential of Agtechs in the modernisation of agribusiness and the reduction of production costs. Significant strengths were identified, such as the wide availability of arable land and the intensive use of advanced technologies, which drive the sector. At the same time, there are weaknesses related to the historical structure and culture of entrepreneurship in the country, affecting the scalability of business models. The application of SWOT analysis made it possible to map opportunities for the development of strategies that address the competitiveness and sustainability of the sector. The results indicate that the integration of innovative practices and the improvement of technological processes can accelerate the sustainable growth of Agtechs. Thus, the findings demonstrate that a strategic approach, grounded in the analysis of internal strengths and deficiencies, is essential to the advancement of Brazilian agribusiness.

The research by Soares e Jacometti (2015) showed that innovative and sustainable strategies have added value to the Brazilian agribusiness sector. They observed an effective integration of advanced technologies into the production chain, enhancing competitiveness. The analyses revealed that combining investments in infrastructure and technological innovation raises productivity. Opportunities were identified for the development of management models based on SWOT analysis, maximising strengths and mitigating weaknesses. The importance of practices that align the modernisation of agriculture with environmental sustainability was also noted. These results point to the need for integrated efforts between the public and private sectors to consolidate agribusiness on a global stage.

The study by Martyniuk e Khodakivska (2022) demonstrated that the digitalisation of the agricultural sector emerges as a determining factor for increasing the productivity and efficiency of private enterprises. It was found that, despite the significant potential of the available resources, the performance indices of Ukrainian enterprises still fall short of those achieved in countries with greater technological and institutional support, such as Germany. The SWOT analysis highlighted significant strengths, such as the wide availability of land and labour, contrasted with weaknesses related to the scarcity of investments and legislative support. It was observed that the integration of digital technologies – notably in automation and data management processes – optimises operations and reduces operating costs. The

results point to the need to strengthen public policies that encourage the modernisation and improvement of technological processes in agribusiness. Thus, the strategic implementation of digitalisation emerges as a key element for boosting the competitiveness and sustainable growth of the agricultural sector.

The application of SWOT analysis integrated with the Business Model Canvas makes it possible to clearly identify the strengths, weaknesses, opportunities and threats in the vertical farming business model. It was observed that the incorporation of advanced technologies and the automation of processes are decisive factors for enhancing the competitiveness and operational efficiency of the sector. The results point to the centrality of sustainable aspects, both environmental and social, in the consolidation of innovative strategies. It was identified that continuous investments in technological infrastructure favour the reduction of costs and the generation of added value. The research emphasises the importance of strategic partnerships and a systematic view of market changes, which strengthens the proposal for sustainable growth. Thus, the findings indicate that the integrated approach of SWOT analysis with other management tools fosters the transformation and modernisation of Brazilian agribusiness (MALEKI, 2022).

The study by Silva (2021) investigates the influence of strategic planning versus the practice of innovation on the business performance of Agtechs, seeking to determine which factor is more decisive for the success of these companies. The methodology adopted is qualitative, with a multi-case study involving the analysis of primary and secondary data. The results indicate that there is no consensus on which factor is more important, but that the combination of agile planning with incremental innovations and conventional planning with disruptive innovations may be more effective. The research highlights the importance of strategic planning as a daily decision-making tool to increase the chances of success.

3 METHODOLOGY

3.1 SWOT ANALYSIS

SWOT analysis – an acronym for Strengths, Weaknesses, Opportunities and Threats – is a fundamental strategic tool for evaluating the positive and negative aspects of a business, considering both internal and external factors. This approach, widely used in case studies and academic research, enables a comprehensive understanding of the business environment, contributing to the formulation of sound and well-grounded strategies (Hofrichter, 2021).

Within the scope of internal factors, strengths represent the positive attributes of the organisation, whether tangible or intangible, that confer competitive advantages over

competitors. These attributes, which are under the company's control, may range from advanced technological processes to excellence in customer service. It is essential that the organisation exploits these strengths to maintain a prominent position in the market, as well as to mitigate potential weaknesses (Silva, 2011). For example, an analysis carried out by Fantoni (2016) showed that, in the civil engineering sector with a focus on sustainable technologies, factors such as the significant reduction in construction execution time and the fixed contract, which allows the client to know the total cost in advance, constitute major competitive advantages.

On the other hand, weaknesses represent the internal limitations that may compromise performance and the achievement of goals. They manifest themselves in the form of inefficient processes, failures in internal communication or the poor distribution of responsibilities, placing the company at a competitive disadvantage. Martins (2007) emphasises that the recognition and critical analysis of these deficiencies are essential for the implementation of improvements and for the maintenance of sustainable performance in the long term. A practical example is observed in a French school in São Paulo, where discontinuity in management, the lack of clear definition of employees' roles and the difficulty in retaining students were identified as critical points (Martins, 2007).

With regard to external factors, opportunities arise as favourable elements that can be exploited to leverage the company's growth. Such opportunities may stem from the emergence of new markets, technological changes or even governmental policies that promote financing and incentives. In Fantoni's (2016) study on the civil engineering company, relevant opportunities were identified, such as the expansion of housing finance programmes, society's growing interest in sustainable practices, the housing deficit and the potential to operate in differentiated market niches.

Finally, threats constitute the external challenges that may adversely impact the growth and stability of the company. These factors range from intense competition, which may consolidate the position of rival brands, to economic crises and the possibility of piracy or imitation of the business model. Martins (2007) warns that the continuous monitoring of these threats is crucial so that the organisation can develop preventive and reactive strategies, minimising the risks inherent to its operating environment. A practical example of threat analysis was verified by Dias (2018) in a delivery company in Bahia, where problems such as informality in sales, the consolidation of competition, customer dissatisfaction, the risk of copying the business model and financial instability were identified.

In short, SWOT analysis presents itself as an indispensable tool for understanding the factors that influence the performance of an organisation. By integrating the evaluation of

internal strengths and weaknesses with external opportunities and threats, managers have a strategic vision that enables them to anticipate challenges, enhance strengths and implement continuous improvements. In this way, SWOT analysis not only underpins strategic decisions, but also provides an environment of constant evolution and adaptation in an increasingly competitive market. It is important to emphasise that the correct application of this methodology can be decisive for the success and sustainability of a company in the long term.

3.2 GENERAL ENVIRONMENT AND TASK ENVIRONMENT

SWOT analysis, as Manktelow e Carlson (2010) point out, consists of the detailed evaluation of the external and internal situations that impact the achievement of an organisation's objectives. According to the authors, opportunities and threats refer to the circumstances of the external environment that influence the vision and the challenges for achieving goals, while strengths and weaknesses concern the internal characteristics that reveal the advantages and disadvantages in the pursuit of the desired results. In summary, the application of SWOT analysis enables the detailed identification of both the adversary and the conditions of the environment, contributing to the definition of a sound strategic positioning and an effective action plan.

For the definition of the variables to be analysed and compared in the different areas of operation of Agtechs, the concepts of general environment and task environment were used, as proposed by (CHIAVENATO e SAPIRO, 2020). According to this author, the general environment—or macroenvironment—encompasses the conditions that affect, directly or indirectly, all organisations in a generic way, constituting a scenario of common conditions inherent to the market.

Technology is a product of science and engineering, involving a set of instruments, methods and techniques aimed at solving problems. Thus, technological development, whether generated internally or coming from other organisations, has a direct impact on the innovation and competitiveness of the company, even though it is an area subject to uncertainties regarding its future.

In addition to technology, legal conditions play a fundamental role in the operationalisation of companies, insofar as current laws and regulations positively or negatively influence commercial behaviours, working conditions and supervision, among other aspects. Likewise, political aspects—related to the context and ideological definitions at the federal, state and municipal levels—may contribute to stability or generate instability in the economic and institutional conditions of the country, directly affecting business activities.

In the field of economic issues, permanent or temporary factors that influence the country's development, such as prices, profitability, supply and demand, exert a direct impact on the functioning and sustainability of companies. In addition, demographic aspects, which encompass variables such as population growth rate, geographical distribution, and ethnic and religious composition, provide subsidies so that organisations can monitor market characteristics and anticipate future trends.

Ecological conditions also play an important role, as they encompass physical and natural aspects—such as pollution, climate and logistics—that externally surround the company, allowing the business to be both affected by and to influence its ecosystem. Finally, cultural aspects, which encompass the knowledge, traditions and behaviours of a social group, are manifested in language, cuisine, music and the arts in general, as Oliveira (2022) points out. These cultural elements are indispensable so that companies can map the interests and behaviours of their consumers, both current and potential.

In summary, understanding the various elements that make up the general and task environment is fundamental to the effective application of SWOT analysis. By integrating knowledge about opportunities, threats, strengths and weaknesses, organisations are better equipped to define successful strategies, ensuring a competitive positioning and effectiveness in the execution of their action plans.

3.3 THE TASK ENVIRONMENT

The internal environment of a company, also called the operations environment, comprises the sectors and elements with which the organisation interacts directly, significantly influencing the achievement of its goals and objectives (Daft, 2003). This operational space is fundamental to the efficiency and development of the business, as it involves relationships that directly impact productivity and organisational performance.

Among the crucial components of this environment, the importance of suppliers stands out first. They are responsible for supplying the inputs necessary for the functioning of the company, including raw materials, capital, technology and human resources. Dependence on efficient and committed suppliers largely determines the organisation's ability to maintain the quality and continuity of its operations.

Another essential element concerns customers or users, who consume the products and services generated by the business activity. Understanding the needs and expectations of this public enables the company to adjust its offering and develop competitive advantages that ensure their loyalty and satisfaction, contributing to the sustainable growth of the business.

Competitors also make up this internal environment, although their influence comes from outside the direct control of the company. The presence of organisations that offer similar services or products stimulates competitiveness and forces the company to constantly improve its strategies in order to stand out in the market.

Finally, regulatory entities play an indispensable role in defining the rules and regulations that guide business activities. Examples of this group are trade unions, class associations and government regulatory bodies, which act in the supervision and standardisation of the sector, ensuring that operations are carried out within a framework of legal and ethical compliance.

In summary, the internal environment of the company is composed of a set of relationships and elements that, together, shape the operational efficiency and competitive capacity of the business. Each component, from suppliers to regulatory bodies, performs a function that, if well managed, can provide the ideal conditions for the success and sustainable growth of the organisation.

4 RESULTS AND DISCUSSION

4.1 COMPARING THE DIFFERENT AREAS OF OPERATION WITH THE SWOT METHODOLOGY

After data collection, in which the location of the Agtechs was addressed along with their operational and conceptual differences in each area of operation, the systematisation of the areas of operation was carried out through SWOT analysis (Strengths, Weaknesses, Opportunities, and Threats).

SWOT analysis aims to identify strengths, weaknesses, opportunities and threats, being fundamental for providing a good database for strategic decision-making and a better direction for agribusiness startups.

In this set, the general environment and the task environment were defined. According to Daft (2003), the general environment consists of a series of external conditions and elements that surround and diffusely influence all companies. Thus, this environment exerts an indirect impact on the daily operations of these companies. In this way, the main identifiable variables in the general environment are: technological, legal, political, economic, demographic, ecological and cultural conditions.

The task environment, according to Daft (2003), corresponds to the most immediate and closest segment of the general environment. This task environment encompasses the sectors with which the organisation interacts directly and which exert a direct impact on the organisation's ability to achieve its objectives. In this way, the main identifiable variables in

the task environment are: input suppliers, customers or users, competitors and regulatory entities.

According to Ferrell e Hartline (2009), the main contributions of this methodology are:

1. The simplicity of SWOT analysis makes it accessible, requiring only a basic understanding of the company and its sector, without the need for extensive training or technical skills to be used successfully.
2. It offers lower costs, since it does not require specialised training, thus reducing the costs associated with strategic planning.
3. Its flexibility makes it possible to improve the quality of strategic planning, even without extensive marketing information systems. This means that SWOT analysis can be effective regardless of the availability of detailed information.
4. SWOT analysis integrates and synthesises a variety of information, both qualitative and quantitative, from various sources. This transforms the diversity of information into an advantage, strengthening the strategic planning process.
5. It facilitates collaboration and the exchange of information between managers of the different functional areas, promoting a more holistic and integrated approach to the organisation's strategic planning.

In this way, for each area of operation, the SWOT methodology was applied, with the purpose of evaluating the internal and external characteristics of agribusiness startups. Thus, the area of operation with the greatest prominence is decision support technologies, which have as strengths, as shown in Table 6:

1. **Agricultural efficiency:** It contributes to optimising the use of resources, in addition to increasing productivity and reducing operating costs.
2. **Customisation:** This technology seeks to serve each customer in a personalised way, adapting the innovation to each type of crop, climatic conditions, space and availability of resources, which becomes an advantage over those technologies that only meet specific needs.
3. **Access to real-time data:** It keeps the farmer always up to date, even without being present in the field, allowing them to check the progress of production and making decision-making more agile.

With regard to weaknesses, the following were analysed:

1. **Initial costs:** The initial implementations require a high investment, due to the complexity of the technological infrastructure and periodic maintenance.
2. **Need for connectivity:** As it is an integrated and automated technology, it is necessary for the connection in the field to be of good quality, as the performance of the technology depends on this factor.
3. **Learning:** The adoption of the technology by farmers or future customers may depend on familiarity with the new technologies. Those who do not have frequent contact may be reluctant to adopt new solutions, which may limit market reach.

Analysing the opportunities and threats of this area of operation, we have as opportunities:

1. **Market expansion:** Due to Agriculture 4.0, the agricultural sector is undergoing several changes. The search for new technologies has become increasingly recurrent, generating a growing demand. Being a rising market, the chances of growth are increasingly greater.
2. **Sustainability:** The demand for increasingly sustainable agricultural systems has been growing, and technologies are great allies in the pursuit of agriculture with less impact on the environment.

When it comes to threats, three main types were analysed:

1. **Regulation:** Changes in government regulations related to agriculture and technology may create uncertainties and increase compliance costs for the solution provider.
2. **Competition:** As it involves innovation, the emergence of new players may generate competition in the market, especially when there are differences in cost and quality, impacting profits and market share.
3. **Technological failures:** It involves a small share of errors that may occur during use, interfering in the final result.

Table 1

SWOT of the decision support technologies area

Strengths	Weaknesses	Opportunities	Threats
Agricultural Efficiency (Oliveira, 2022)	Initial Costs (Nascimento, 2022)	Market Expansion (Oliveira, 2022)	Regulation (Nascimento, 2022)

Customization	Need for connection (Oliveira, 2022)	Sustainability	Competition (Zambalde, 2011)
Access to real-time data (Massruhá, 2015)	Learning (Souza, 2019)		Technological failures (Massruhá, 2015)

Source: Prepared by the authors.

In the second area of operation, which is growing the most among Agtechs, we have management software, with great prominence for driving a more modern and sustainable agriculture. Thus, as shown in Table 7, the strengths are:

1. **Integration with other technologies:** Capacity for integration with precision agriculture devices, such as soil sensors, agricultural drones and automated equipment, providing efficient management of agricultural operations.
2. **Rural administration:** It collaborates in improving agricultural management, during day-to-day processes and also in the control of production, financial resources and tax obligations, making all processes more efficient.

On the other hand, as weaknesses:

1. **Digital infrastructure:** Connection problems in the field become frequent, due to vulnerability to interruptions in the power supply and connection failures, limiting the performance of the software.
2. **User knowledge:** Generally, producers have limited knowledge about the functioning of new digital tools, making the learning process incomprehensible for new users, which may become a barrier to acquiring these tools in agricultural production.

The opportunities that this area of operation presents are:

1. **Consumer market in the digital age:** Agriculture has also shown itself to be increasingly integrated with technologies, enabling the emergence of agricultural e-commerce, and online marketplaces are providing new channels for the sale and purchase of agricultural products, expanding markets for both producers and consumers. Finally, awareness of sustainability is opening space for more responsible and eco-friendly agricultural practices, creating opportunities for products and services related to sustainable agriculture.

2. **Training in digital agriculture:** Due to farmers' lack of familiarity with these tools, the provision of training and courses becomes a possibility, enabling more producers to acquire these new technologies.

With regard to threats, the following stand out:

1. **Cybersecurity risks:** Due to the growing digitalisation and automation in the agricultural sector, these agricultural digital systems may also contain sensitive data, such as information on crops, agricultural practices, financial data and farmers' personal information. The theft of these data may lead to privacy issues.

Table 2

SWOT of the management software area

Strengths	Weaknesses	Opportunities	Threats
Integration with other technologies (Bambini, 2015)	Digital infrastructure (Milanez, 2020)	Consumer market in the digital environment (Zambalde, 2011)	Cybersecurity risks (Bambini, 2015)
Rural Management (Ramos, 2022)	User knowledge (Sordi, 2020)	Training in digital agriculture (Bolfe, 2020)	

Source: Prepared by the authors.

The smart equipment and hardware area of operation, as shown in Table 8, has as strengths:

1. **Operational efficiency:** The purpose of this smart equipment is to significantly improve production, automating tasks and optimising the use of resources. Through this equipment, it is possible to reduce spending on fertilisers, harvest time and disease identification, contributing to the better performance of agriculture.
2. **Precision and monitoring:** Smart sensors and devices offer greater precision and real-time monitoring capacity, allowing more accurate management of agricultural operations.

The weaknesses are as follows:

1. **Development:** The design and development of the equipment consists of a long process that begins with the identification of the need and the challenges faced, in which the feasibility of implementing the technology will be studied. This requires a large investment of financial capital for this equipment to reach the market.

2. **Maintenance:** The maintenance of smart equipment in agriculture is a crucial aspect for ensuring the effectiveness, reliability and longevity of these technological systems. However, this maintenance generates a cost for the producer, which may result in non-compliance with periodic maintenance, affecting the useful life of the equipment.

The opportunities presented in this area of operation are:

1. **Logistics:** The logistics process between producers and traders may generate losses in production, whether through inadequate storage, loss of quality during transport or loss of quantity. Thus, smart equipment may provide optimisation and modernisation of logistics in the field, assisting in real-time tracking, route optimisation and stock management, always ensuring the best processes to maintain the quality and quantity of production.
2. **Waste reduction:** Through the implementation of smart equipment and hardware, the opportunity is offered to reduce waste, both in the use of agricultural inputs and in losses during harvest and the distribution process. This equipment can be implemented for monitoring climatic conditions, pests and diseases that may directly affect production yield, in addition to providing a more precise harvest.

Regarding the threat involved in this area of operation, the following can be mentioned:

1. **Connectivity in the field:** It may expose the vulnerability of smart devices, which may suffer data theft attacks, interruptions of operations and interference in connectivity. In order to minimise these risks, practices must be adopted that ensure greater security for the producer.

Table 3

SWOT of the smart equipment and hardware area

Strengths	Weaknesses	Opportunities	Threats
Operational efficiency (Junior, 2021)	Development (Vicente, 2002)	Logistics (Ramos, 2022)	Field connectivity (Milanez, 2020)
Precision and monitoring (Bolfe, 2020)	Maintenance (Vicente, 2002)	Waste reduction (Vargas, 2013)	

Source: Prepared by the authors.

With regard to the precision agriculture area of operation, its SWOT analysis was carried out, as shown in Table 9, containing as strengths:

1. **Greater fertility:** Due to the technologies used, such as sensors and GPS, it is possible to map and identify each space to increase productivity at the site. In addition, there is greater pest control, so that they do not interfere in production and cause significant losses.
2. **Waste reduction:** In the processes of applying inputs and pesticides, there is a great deal of waste. However, due to precision agriculture, waste reduction has become increasingly frequent. There is equipment that identifies areas with weeds, applying chemical products only to the affected areas.
3. **Automation:** Through precision agriculture, all field processes, such as planting, application of inputs and harvesting, can be optimised, generating greater productivity. As an example, we can mention smart planting, in which it is important to know how many seeds to plant and the distance between them, since when planted too close together, they may compete for sun and nutrients.

The weaknesses are as follows:

1. **Specialised labour:** Due to the technical complexity of precision agriculture, the demand for specialised workers is increasingly frequent, as it is necessary to have solid knowledge about the technologies and tools used in the field so that production becomes increasingly efficient.
2. **Implementation:** For farmers with limited resources, the implementation costs may be an obstacle to the adoption of the technology. Therefore, this technology is limited to large producers.

As opportunities in the precision agriculture area of operation, there are:

1. **Reduction of environmental contamination:** The pursuit of reducing environmental impacts is an increasingly important trend in agribusiness, due to the need for biodiversity conservation and the conscious use of natural resources. In this way, precision agriculture promotes the reduction of input application, which, when applied incorrectly, may harm the plant and the soil. In addition, the use of smart irrigation systems makes it possible to reduce water waste.

2. **Rapid decision-making:** The implementation of the technology allows access to monitoring and control tools, enabling the farmer to have access to crop data in real time. This makes it possible to create more assertive planning, enabling the reduction of risks and the optimisation of production.

Finally, as threats, there are:

1. **Climatic risks:** Due to climatic instability, fluctuations in temperature and rainfall may hinder the performance of the implemented technologies, causing a decrease in productivity.
2. **Economic viability:** The implementation of technology in the field is a process that requires initial investments, covering only large producers. This reduces the market niche, making the technology less accessible for small producers, who end up opting for the traditional method.

Table 4

SWOT of the precision agriculture area

Strengths	Weaknesses	Opportunities	Threats
Greater fertility (Resende, 2010)	Specialized labor (Souza, 2019)	Reduction of environmental contamination (Resende, 2010)	Climate risks (Bassoi, 2019)
Waste reduction (Resende, 2010)	Implementation (Gomide, 2001)	Fast decision-making	Economic viability (Bassoi, 2019)
Automation

With regard to the agribusiness consultancy area of operation, the SWOT analysis was carried out, as shown in Table 10, with the following strengths:

1. **Personalised approach:** For each segment of the agri market, specific planning is necessary to meet the demands of the area. In this way, consultancy, in addition to providing improvements for production, seeks a personalised approach for each client, in which technical recommendations are adapted to local conditions, such as soil type, climate, crop and water availability.
2. **Future projections:** Through data analysis, it is possible to measure future perspectives, analysing trends, economic aspects, market projection, among others. With these

perspectives, it is possible to have a direction for the strategies that will be used to optimise processes.

With regard to weaknesses, there is:

1. **Dependence on human resources:** Agribusiness consultancy is still highly dependent on human labour. To obtain results, continuous monitoring is necessary, which means that the demand for professionals in this area is high, generating a scarcity in the market.

As opportunities identified in the agribusiness consultancy area, we have:

1. **Education and training:** In addition to providing the consultancy service, providing the basic knowledge for the producer is extremely important for maintaining a good operation. In this way, by expanding the consultancy service to training and education of producers regarding their needs in their production, topics such as good agricultural practices, business management and the use of new technologies can be addressed, generating better use of local productive resources.
2. **Diversification in the market:** Agribusiness consultancy offers various services to support producers in achieving better results in their already established production, but the implementation of new crops may be the key to ensuring better results and also the efficiency and profitability of their activities.

As threats involving the agribusiness consultancy area, there is:

1. **Economic and political instability:** The fluctuation in the prices of agricultural commodities may affect the profitability of producers and, consequently, their capacity to invest in consultancy services. In addition, global crises may hinder access to foreign markets, and the devaluation of various crops may also occur.

Table 5

SWOT of the agribusiness consultancy area

Strengths	Weaknesses	Opportunities	Threats
Personalized approach (Nunes, 2021)	Dependence on human resources (Souza, 2019)	Education and training (Bolfe, 2020)	Economic and political instability (De Carvalho, 2023)
Future projections		Market diversification	

Source: Prepared by the authors.

Regarding the agricultural marketing area of operation, the SWOT analysis was carried out and the following aspects were identified:

Strengths:

1. **Superior quality:** With technological advances and the growing demand for quality food, it is necessary to use means that ensure this parameter. Thus, the biofortification of food becomes a differential for increasing the content of micronutrients, such as vitamins and minerals, and can be done through genetic manipulation or through fertilisation.
2. **Storage:** To ensure the best post-harvest conditions of the product, the storage process is essential to avoid significant losses in production. With this, the implementation of technological tools enables greater control of humidity, temperature and sanitisation.

Weaknesses:

1. **Agility in the distribution of products:** Logistics processes are fundamental to ensure that the product reaches the final consumer with quality. In this way, transport with safety and quality becomes a barrier to achieving better marketing of products, as volume, distance and price are the main challenges of agricultural logistics.
2. **Access to the international market:** The lack of marketing in international markets can be explained by the exchange rate and also by import taxes. Thus, regulatory issues do not encourage aspects of international marketing.

Opportunities:

1. **ESG certification:** In order for agricultural marketing to comply with environmental, social and governance parameters, these must be implemented throughout the production chain. With this, products that have ESG certification present greater credibility and also boost their marketing.
2. **Digitalisation of marketing:** To make marketing faster and more dynamic, having an e-commerce platform aimed at the main distributor markets may result in an improvement, in which purchase and payment can be made through the platform.

Threats:

1. **Inflation:** Inflation may have a significant impact on marketing, affecting both producers and consumers, and may affect production costs, the prices of agricultural products and consumer demand.
2. **Climate change:** The instability of climatic conditions becomes a threat to production and directly affects marketing, since, in most cases, producers are not prepared for this type of situation.

Table 6

SWOT of the agricultural marketing area of operation

Strengths	Weaknesses	Opportunities	Threats
Superior quality	Agility in product distribution (Gaban, 2017)	ESG Certification	Inflation
Storage (Gaban, 2017)	Access to the international market (Alves, 2007)	Digitalization of commercialization (E-commerce) (Prado, 2020)	Climate change (Basso, 2019)

Source: Prepared by the authors.

Finally, the SWOT analysis of the food security area of operation was carried out, in which the following strengths were recognised:

Strengths:

1. **Global relevance:** Food insecurity is recognised as a significant global problem, requiring increasing efforts in the search for effective solutions. Its relevance has encouraged interest in the development of new technologies that can assist in combating this challenge.
2. **Public and private partnerships:** In order to contemplate Sustainable Development Goal number 2, which consists of eradicating hunger and promoting sustainable agriculture, having both public and private allies is fundamental to intensifying the strategies promoted.
3. **Microbiological analyses:** With the performance of microbiological analyses, it is possible to ensure the safety and quality of food, preventing contaminated food from reaching the consumer, providing greater hygiene conditions.

Weaknesses:

1. **Food distribution:** The logistics processes involved so that food reaches all segments of the population present several stages, in which, during distribution, there may be failures and losses, hindering access.
2. **Dependence on suppliers:** To ensure that food reaches everyone, it is necessary to have a reliable network of suppliers that can ensure a continuous and adequate supply of food. The lack of an efficient logistics process may lead to significant losses.

Opportunities:

1. **Waste reduction:** In Brazil, food distribution is inadequate, which generates waste. In this way, waste reduction is essential to provide an improvement in the management of the supply chain, allowing food that would be destined for the rubbish to be redistributed to vulnerable populations or those in a situation of food insecurity.
2. **Food education in schools:** It is a fundamental strategy to promote greater awareness about the proper use of food and correct nutritional knowledge, enabling healthier and more conscious choices. In addition, introducing teaching about the importance of reducing food waste.

Threats:

1. **Pests and diseases in crops:** The presence of pests and diseases in agricultural production may compromise food security, resulting in a decrease in the quality of food, interruption in the supply chain and food waste.
2. **Scarcity of natural resources:** Natural resources are fundamental for food production, and their scarcity generates significant losses in production, impacting the distribution of food to the population. For this reason, the search for sustainable management practices is increasingly required to reduce the impacts of the use of natural resources.

Table 7

SWOT of the food security area of operation

Strengths	Weaknesses	Opportunities	Threats
Global Relevance (Vasconcelos, 2005)	Food distribution (Caixeta Filho, 2021)	Waste reduction (Vargas, 2013)	Pests and diseases in crops
Public and private partnerships (Cotta, 2013)	Dependence on suppliers	Food education in schools (Verthein, 2021)	Scarcity of natural resources (Maniglia, 2020)

Therefore, the SWOT analysis of the Agtechs' areas of operation highlights a robust internal environment, with significant strengths. Agricultural efficiency is a highlight, optimising resources, increasing productivity and reducing operating costs. The customisation of technological solutions caters to different types of crop and climatic conditions, while access to real-time data enables quick and informed decisions. In addition, smart equipment contributes to operational efficiency and waste reduction.

However, these strengths are counterbalanced by internal challenges. High initial costs represent a significant barrier, as does the need for a high-quality connection in the field. The adoption of new technologies requires training and familiarity, which may be an obstacle for many farmers. Digital infrastructure and the need for specialised labour are also weaknesses that need to be addressed.

In the external environment, the opportunities are vast. Market expansion, driven by Agriculture 4.0, and the growing demand for sustainability offer great potentialities. The digitalisation of the agricultural market and e-commerce open new possibilities for marketing, while access to the international market and public and private partnerships strengthen food security and sustainability.

However, the threats should not be underestimated. Changes in government regulations may create uncertainties and increase costs. Competition is growing, with new players entering the market. Cybersecurity risks, adverse climatic conditions and economic and political instability also represent significant challenges.

5 CONCLUSIONS

The study demonstrated the relevance of SWOT analysis as a strategic tool for the Agtechs sector, identifying strengths, weaknesses, opportunities and threats that shape the business environment. The application of the methodology enabled a comprehensive understanding of the internal and external dynamics, making it possible to develop more effective strategies adapted to the context of Brazilian agribusiness. The integrated analysis of critical factors contributes to more robust strategic planning aligned with market needs.

The limitations of the study lie in the qualitative approach, which, although in-depth, may not be generalisable to all contexts of Agtechs in Brazil. The limited sample of companies analysed and the specificity of the geographical regions considered may restrict the

applicability of the results. Future studies could explore a quantitative approach with a larger and more diversified sample to validate and expand the conclusions.

The contributions of the study are significant for the field of management and innovation in agribusiness, offering a practical framework for the strategic analysis of Agtechs. The identification of critical success factors and the challenges faced by companies in the sector provides important information for entrepreneurs, investors and policy-makers. The research also highlights the importance of continuous adaptation and innovation to ensure the competitiveness and sustainability of Agtechs.

It is concluded that the study reinforces the need for a strategic and integrated approach to the development of the Agtechs sector in Brazil, considering both internal and external aspects. SWOT analysis proved to be a valuable tool for decision-making and for planning actions aimed at sustainable growth and the consolidation of innovation in agribusiness.

ABSTRACT

Digital transformation has become a strategic factor for the competitiveness of service organizations, enabling better operational traceability, fewer errors, and faster data-driven decision making (Laudon & Laudon, 2016). In Mexico, INEGI (2020) reports that 99.8% of the country's economic units are micro, small, and medium-sized enterprises (MSMEs), highlighting the need for affordable technological solutions aligned with real operational processes. University academic-administrative units face analogous problems: data scattered across spreadsheets, informal coordination through instant messaging, incomplete files, and limited auditability. To address this problem, the learning unit program management system was developed as an in-house web system for centralizing academic planning and Learning Unit Program (PUA) management. The solution was implemented using a decoupled architecture: Laravel in the backend, React in the frontend, and MySQL as the database engine, following the Model-View-Controller (MVC) pattern and exposed through a RESTful API (Fielding, 2000). The system integrates modules for faculties, degree programs, teachers, subjects, and competencies, with document versioning and automated PDF generation with SHA-256 integrity verification. Functional validation with end users evidenced substantial improvements: centralized subject search in seconds, modular editing with section-level persistence, and PDF versioning with historical traceability. The learning unit program management system demonstrates that tailored software development can outperform generic commercial software, providing functional control, economic feasibility, and direct alignment with institutional processes.

Keywords: Digital Transformation. RESTful API. Academic Management. Laravel. MySQL. Learning Unit Programs.

RESUMO

A transformação digital consolidou-se como um fator estratégico para a competitividade das organizações de serviços, permitindo maior rastreabilidade operacional, redução de erros e otimização da tomada de decisões baseada em dados (Laudon & Laudon, 2016). No México, o INEGI (2020) relata que 99,8% das unidades económicas do país correspondem a micro,

pequenas e médias empresas (MPME), o que confirma a necessidade de soluções técnicas acessíveis e alinhadas com processos reais. As áreas académico-administrativas universitárias enfrentam problemáticas análogas: registos dispersos em folhas de cálculo, acompanhamento informal por mensagens instantâneas, processos incompletos e escassa capacidade de auditoria documental. Para atender a essa problemática, desenvolveu-se o sistema de gestão de programas de unidade de aprendizagem, um sistema web in-house orientado a centralizar o planeamento académico e a gestão dos Programas de Unidade de Aprendizagem (PUA). A solução foi implementada com uma arquitetura desacoplada: Laravel no backend, React no frontend e MySQL como motor de base de dados, seguindo o padrão Model-View-Controller (MVC) e exposto através de uma API RESTful (Fielding, 2000). O sistema integra módulos para faculdades, cursos, docentes, disciplinas e competências, com mecanismos de versionamento e geração automática de documentos PDF com verificação de integridade SHA-256. A validação funcional com utilizadores finais evidenciou melhorias substanciais: centralização da consulta académica em segundos, edição modular com persistência por secção e versionamento PDF com rastreabilidade histórica. O sistema de gestão de programas de unidade de aprendizagem demonstra que o desenvolvimento sob medida pode superar as limitações do software genérico, oferecendo controlo funcional, viabilidade económica e alinhamento direto com os processos institucionais.

Palavras-chave: Transformação Digital. API RESTful. Gestão Académica. Laravel. MySQL. Programas de Unidade de Aprendizagem.

RESUMEN

La transformación digital se ha consolidado como factor estratégico para la competitividad de las organizaciones de servicios, permitiendo mayor trazabilidad operativa, reducción de errores y optimización en la toma de decisiones basada en datos (Laudon & Laudon, 2016). En México, el INEGI (2020) reporta que el 99.8% de las unidades económicas del país corresponden a micro, pequeñas y medianas empresas (MIPYMES), lo que confirma la necesidad de soluciones técnicas asequibles y alineadas con procesos reales. Las áreas académico-administrativas universitarias enfrentan problemáticas análogas: registros dispersos en hojas de cálculo, seguimiento informal por mensajería instantánea, expedientes incompletos y escasa capacidad de auditoría documental. Para atender dicha problemática, se desarrolló el sistema de administración de programas de unidad de aprendizaje, un sistema web in-house orientado a centralizar la planeación académica y la gestión de los Programas de Unidad de Aprendizaje (PUA). La solución fue implementada con una arquitectura desacoplada: Laravel en el backend, React en el frontend y MySQL como motor de base de datos, siguiendo el patrón Model-View-Controller (MVC) y expuesto a través de una API RESTful (Fielding, 2000). El sistema integra módulos para facultades, carreras, docentes, materias y competencias, con mecanismos de versionado y generación automática de documentos PDF con verificación de integridad SHA-256. La validación funcional con usuarios finales evidenció mejoras sustanciales: centralización de la consulta académica en segundos, edición modular con persistencia por sección y versionado PDF con trazabilidad histórica. El sistema de administración de programas de unidad de aprendizaje demuestra que el desarrollo a la medida puede superar las limitaciones del software genérico, ofreciendo control funcional, viabilidad económica y alineación directa con los procesos institucionales.

Palabras clave: Transformación Digital. API RESTful. Gestión Académica. Laravel. MySQL. Programas de Unidad de Aprendizaje.

1 INTRODUCTION

Higher education institutions manage a considerable volume of academic and administrative information which, in terms of operational complexity, is comparable to that of a small or medium-sized service enterprise: high turnover of records, dependence on internal approvals, and the need for timely responses to audits or institutional reviews (Laudon & Laudon, 2016; Pressman & Maxim, 2020). The persistence of manual procedures in this context is not an isolated phenomenon; INEGI (2024) documents that a significant proportion of MSMEs in Mexico still carry out record-keeping processes without digital support, a tendency that is replicated in academic-administrative environments.

Before the implementation of the learning unit program management system, the academic planning processes at the Facultad de Ingeniería of the Universidad Autónoma de Campeche were carried out through physical notebooks, scattered office files, and coordination messages in mobile applications. This scheme caused data duplication, low traceability of changes, and excessive dependence on the tacit knowledge of operational staff, which Pressman and Maxim (2020) identify as one of the main sources of operational debt in organisations with non-formalised workflows.

The persistence of manual procedures generated three main risks: (1) *operational risk*—prolonged times to locate files, consolidate academic workloads, or verify the status of competencies—; (2) *information quality risk*—inconsistencies between sources and data-entry errors due to the absence of a single point of truth—; and (3) *continuity risk*—when the responsible staff were unavailable, the recovery of the working context proved slow and costly.

As an alternative, the use of third-party commercial software under a rental scheme was evaluated. However, this option presented limitations for the context analysed: recurring fixed costs, low flexibility to adapt specific academic catalogues, dependence on the provider's *roadmap*, and restrictions to incorporate its own logic for PUA management and curricular evidence. Under these criteria, the *in-house* development of a modular platform was technically justified (Pressman & Maxim, 2020).

This article describes the design, implementation, and evaluation of the learning unit program management system, a comprehensive web system for centralising university academic planning. The **general objective** was to design and implement a web system to manage academic planning, centralising key entities and automating the generation of supporting documents, with a scalable architecture based on Laravel, React, and MySQL. The **specific objectives** were:

1. Structure a relational data model for faculties, degree programs, teachers, subjects, and competencies.
2. Build a REST API for CRUD operations, contextual queries, and the PUA document workflow.
3. Implement a React interface oriented towards administrative productivity and module-based navigation.
4. Integrate a versioning and PDF generation mechanism to ensure documentary traceability.
5. Validate the usefulness of the system through functional and usability testing with end users.

The rest of the article is organised as follows: Section 2 presents the theoretical background; Section 3 describes the development methodology; Section 4 details the development of the system; Section 5 reports the results; Section 6 discusses the findings from a comparative perspective; and Section 7 presents the conclusions.

2 THEORETICAL BACKGROUND

2.1 DIGITAL TRANSFORMATION IN HIGHER EDUCATION INSTITUTIONS

Digital transformation is defined as the process by which organisations integrate digital technologies into all their functional areas, fundamentally modifying the way they operate and generate value (Laudon & Laudon, 2016). In the university context, this process involves not only the adoption of technological tools but also the redesign of academic and administrative processes to maximise the efficiency and quality of the educational service.

INEGI (2020) documents that 99.8% of the economic units in Mexico are MSMEs, whose operational structure shares characteristics with the academic-administrative areas of public universities: limited resources, high dependence on operational staff, and frequently non-standardised processes. The Business Demography Survey (INEGI, 2024) adds that the adoption of information technologies in these organisations remains heterogeneous, with significant gaps in the integration of document management systems.

2.2 ACADEMIC INFORMATION SYSTEMS

An information system (IS) is a set of interrelated components that collect, process, store, and distribute data to support decision making and control within an organisation (Laudon & Laudon, 2016). In the academic domain, specialised IS centralise the management of study programs, academic workloads, student records, and curricular

documentation, contributing to the reduction of processing times and the increase of data quality (Pressman & Maxim, 2020).

The document management of academic programs involves complex workflows of approval, versioning, and distribution. The absence of specialised tools forces institutions to depend on generic solutions—spreadsheets, email—that lack mechanisms for version control, auditing, and structured information retrieval (Date, 2004). This functional deficit is the origin of the operational risks identified in the diagnosis of the present study.

2.3 WEB ARCHITECTURES FOR INFORMATION SYSTEMS

The contemporary web development paradigm favours decoupled architectures where the *frontend* and the *backend* operate independently and communicate through well-defined interfaces (Fowler, 2002). In this model, the *backend* exposes services through a RESTful API (*Representational State Transfer*), while the *frontend* consumes these services to build the user interface.

REST is a software architecture style defined by Fielding (2000) in his doctoral dissertation, characterised by the absence of state on the server (*statelessness*), the client-server architecture, the layered system, and the uniform interface based on HTTP resources. An API that adheres to these principles is called RESTful and employs the standard HTTP methods (GET, POST, PUT, PATCH, DELETE) for operations on resources represented in JSON format.

The Model-View-Controller (MVC) pattern, formalised by Fowler (2002), establishes a separation of responsibilities into three components: the Model (business logic and data access), the View (presentation), and the Controller (coordination between Model and View). This pattern is the architectural foundation of modern frameworks such as Laravel for PHP (Laravel LLC, 2026), which also incorporates an ORM (*Object-Relational Mapping*) called Eloquent for the abstraction of database access. React, in turn, is a JavaScript library for building user interfaces based on reusable components that favours the declarative paradigm and the efficient handling of the virtual DOM (Meta Open Source, 2026).

2.4 RELATIONAL DATABASES AND AUTOMATED DOCUMENT GENERATION

The relational model, formalised by Date (2004), organises data into tables with explicit relationships defined by primary and foreign keys, guaranteeing referential integrity and transactional consistency. MySQL is a relational database management system (RDBMS) widely adopted in web applications, which implements the SQL standard and provides robust mechanisms for indexing, ACID transactions, and replication (Oracle Corporation, 2026).

The automatic generation of PDF documents from web applications is carried out through server-side rendering libraries. DomPDF is a PHP implementation that generates PDF documents from HTML templates with support for fonts, tables, and CSS styles, being suitable for academic documents with a standardised institutional format. The use of cryptographic *hash* functions (SHA-256) on the generated documents makes it possible to verify their integrity and detect unauthorised modifications (Pressman & Maxim, 2020).

3 METHODOLOGY

The development of the learning unit program management system was carried out through an iterative and incremental process aligned with the principles of agile software development (Beck *et al.*, 2001). Four main phases were defined that made it possible to advance from the diagnosis to validation with real users:

Phase 1 — Requirements gathering. Through semi-structured interviews with administrative staff and those responsible for academic planning, the operational needs of the system were identified. This qualitative method made it possible to capture both explicit functional requirements and implicit needs derived from the existing workflow (Pressman & Maxim, 2020).

Phase 2 — System design. The relational data model was developed through Entity-Relationship diagrams, the design of the REST API with the specification of endpoints and HTTP verbs, and the user interface prototypes. The model was normalised to the third normal form (3NF) to eliminate redundancies and guarantee referential integrity (Date, 2004).

Phase 3 — Implementation. The *backend* was developed with Laravel following the MVC pattern, exposing REST endpoints for CRUD operations and the PUA document workflow. The *frontend* was built as an SPA (*Single Page Application*) with React and Vite, consuming the REST API through asynchronous HTTP operations.

Phase 4 — Validation. Functional tests were carried out with real academic planning use cases and usability tests with end users. The evaluation verified the correct execution of the critical flows (creation, query, update, deletion, and document generation) in accordance with software quality criteria (ISO/IEC, 2011).

4 SYSTEM DEVELOPMENT

4.1 REQUIREMENTS GATHERING

Based on the semi-structured interviews conducted with administrative staff and users responsible for academic planning, ten fundamental operational needs were identified:

1. Manage faculties, degree programs, academies, and areas as master catalogues with referential integrity rules.
2. Register teachers with association to their position, access role, and academic affiliation.
3. Manage subjects with attributes of credits, theoretical hours, practical hours, subject type, core, and curricular relationship.
4. Incorporate generic and specific competencies linked to faculty and degree program.
5. Query subjects by degree program and study plan to reduce search times.
6. Provide institutional authentication to control access by module.
7. Edit PUA contents by sections, preserving progress and review status.
8. Issue PUA PDF documents with version control and historical download.
9. Allow the maintenance of bibliography and complementary data without altering the core of the system.
10. Maintain an open architecture for future functional extensions.

4.2 ARCHITECTURE AND TECHNOLOGIES

The solution was implemented under a decoupled client-server scheme (Fowler, 2002). The *frontend* was developed as an SPA with React and Vite, using reusable components and state management through *hooks*. The *backend* was built with Laravel, exposing HTTP endpoints for authentication, catalogues, and document management. MySQL was used as persistent storage with referential integrity (Oracle Corporation, 2026).

In the presentation layer, React Router organises navigation by modules: *login*, access panel, teachers, degree programs, subjects, competencies, library, and PUA processing. The interface consumes REST services through *fetch*, performing GET, POST, PUT, PATCH, and DELETE operations with JSON responses (Meta Open Source, 2026).

In the business layer, Laravel centralises validations, persistence rules, and the coordination of Eloquent models. The API includes routes representative of each domain: authentication (*POST /login*), academic management (*GET /materias*, *POST /carreras*, *DELETE /facultades/{id}*), and PUA workflow (*POST /api/pua/documentos*, *PUT /api/pua/documentos/{id}/modulos/{slug}*, *POST /api/pua/documentos/{id}/generar-pdf*). For the document layer, DomPDF was used, encapsulated in a dedicated service that reduces the coupling between the business logic and the document presentation (Fowler, 2002).

4.3 DATABASE DESIGN

The relational model was structured into three levels of abstraction (Date, 2004): base catalogues, academic operation, and PUA document management.

The **base catalogues** include the entities: Faculty, Area, StudyPlan, Academy, Position, SubjectType, Core, and Role. The **academic operation** comprises: Access (credentials and user role), Teacher (links academic identity with faculty, position, and access), Degree Program (associated with faculty and study plan), Subject (central entity with foreign keys to degree program, faculty, area, core, subject type, and academy), Generic Competency, and Specific Competency (support the structure of learning outcomes by curricular context).

The **PUA document management** is supported by three specialised tables: *pua_documentos* (defines the base document by degree program and subject, with metadata and review status), *pua_modulos* (persists editable document sections in JSON format by *slug*), and *pua_versiones* (records version, status, SHA-256 *checksum*, and the path of the issued PDF). This structure guarantees transactional consistency, avoids record duplication, and allows historical traceability of the academic document (Date, 2004).

The key business relationships established are:

1. Faculty 1:N Degree Program, Academy, Teacher, and Specific Competency.
2. Degree Program 1:N Subject and 1:1..N StudyPlan according to institutional configuration.
3. *pua_documentos* 1:N *pua_modulos* and 1:N *pua_versiones*.
4. Integrity reinforced by unique constraints on critical combinations (degree program-subject and document-slug).

4.4 PROGRAMMING LOGIC

The implementation adopts the Laravel MVC pattern to separate responsibilities (Fowler, 2002): the Model represents business entities and Eloquent relationships; the Controller receives HTTP requests, validates parameters, and coordinates CRUD operations; and the View is materialised as JSON responses for consumption by the decoupled *frontend*.

In React, the interface logic is organised by functional components and local state. The PUA processing module synchronises faculty-degree program-subject, creates or retrieves the active document, and persists each section as an independent module. This strategy improves data recovery, reduces the loss of progress, and enables incremental work between sessions.

The versioning flow operates in four stages: (a) consolidation of the modules persisted in the database, (b) *rendering* of the PDF template through DomPDF, (c) storage of the binary on local disk, and (d) recording of version metadata with a SHA-256 *checksum*. This sequence provides change control and integrity evidence for auditing, responding directly to the information quality and operational continuity risks identified in the diagnosis.

From an extensible design perspective, the document generation layer can be extended through the *Strategy* pattern (Gamma *et al.*, 1995), which encapsulates different generation algorithms (PDF, XLSX, HTML) in an interchangeable manner without modifying the controllers or the core domain. Input validations were incorporated in the *backend* and *frontend* to minimise inconsistent data. As an immediate improvement, it is recommended to reinforce authentication with standard cryptographic *hashing* (bcrypt or Argon2) and session policies with expiration times, in accordance with OWASP security best practices.

5 RESULTS

5.1 AUTHENTICATION MODULE

The access interface centralises institutional authentication and redirects the user to a panel according to their operational context. The screen reduces incorrect entries through prior format validation and handling of connection errors, improving the initial experience of the system. This module implements role-based access control, ensuring that each user views only the modules corresponding to their academic affiliation.

5.2 DASHBOARD AND OPERATION PANEL

The main panel integrates navigation by academic administration modules and sections of operational statistics. The visual structure prioritises high-frequency accesses, reducing idle times in query and data-entry tasks. The behaviour of the interface allows a rapid transition between academic control operations without leaving the working context, favouring the productivity of the administrative staff.

5.3 CRUD OF ACADEMIC ENTITIES

Complete forms and listings were implemented for teachers, degree programs, subjects, faculties, academies, competencies, and bibliography. The standardisation of these CRUD modules made it possible to consolidate previously scattered data, eliminate duplications, and establish a single repository of institutional information—a principle called *Single Source of Truth* (Fowler, 2002)—guaranteeing consistency in all system operations.

5.4 DOCUMENT AUTOMATION AND PDF VERSIONING

The PUA module allows the selection of faculty, degree program, and subject; each section of the program is saved by module and can be marked by review status (draft, under review, approved). Upon completion, the system generates a new downloadable PDF version, preserving the complete history of issuances for auditing and academic control. The SHA-256 *checksum* mechanism guarantees the integrity of the generated document and makes it possible to detect unauthorised modifications a posteriori.

5.5 VALIDATION WITH END USERS

Functional validation was carried out with real academic planning use cases: creation, query, update, deletion, and document generation. Usability tests with end users confirmed a substantial improvement in the understanding of the operational flow, especially in the tasks of curricular selection and PUA document issuance. Table 1 summarises the comparative operational impact observed.

Table 1

Comparativa de impacto operativo: esquema manual vs. PlaneaciónPUA.

Process	Previous scheme (manual)	Scheme with PlaneaciónPUA
Search for academic data	Relied on multiple scattered files and coordination via instant messaging	Centralized and structured query in seconds
Consolidation of the PUA	Fragmented data entry with high incidence of rework and loss of progress	Modular editing with per-section persistence and incremental accumulation of progress
Documentary evidence	Loose files without traceability or change control	PDF versioning with full history and SHA-256 verification
Operational continuity	Dependence on the individual knowledge of operational staff	Standardized workflow on a single platform, independent of individuals

Note. Elaborated by the authors based on validation with end users (2026).

Source: Prepared by the authors.

The overall result shows the resolution of the original problem: administrative friction was reduced, data quality was strengthened, and the responsiveness to internal requirements was increased. From a business perspective, this behaviour is equivalent to the expected benefit in an MSME that migrates from manual processes to an integrated digital platform (Laudon & Laudon, 2016).

6 DISCUSSION

The results obtained demonstrate the feasibility of the *in-house* development of academic information systems for university environments with limited resources. This feasibility contrasts with the widespread perception that tailored software is inaccessible for small and medium-scale organisations, which coincides with the findings of Pressman and Maxim (2020) regarding the differential value of well-designed software in contexts with specific operational needs.

The decoupled Laravel-React-MySQL architecture was validated as a robust and economically viable technological combination. Laravel facilitates the rapid development of RESTful APIs through its Eloquent ORM and its expressive routing system (Laravel LLC, 2026), while React provides a fluid user experience through the efficient management of the virtual DOM (Meta Open Source, 2026). MySQL offers transactional reliability and a mature relational model that supports the complexity of the relationships between academic entities (Oracle Corporation, 2026). This technological choice is consistent with Fowler's (2002) recommendations on the separation of responsibilities into layers as a central maintainability strategy.

The versioning mechanism with a SHA-256 *checksum* provides an auditing dimension that manual processes could not guarantee. This functionality responds directly to the information quality and operational continuity risks identified in the diagnosis phase, and aligns with the principles of documentary traceability required by institutional accreditation processes.

The main limitation identified in the current system is the authentication layer, which employs basic credential validation mechanisms. The implementation of cryptographic *hashing* (bcrypt or Argon2) and the adoption of JWT tokens (*JSON Web Tokens*) for session management are recommended, in accordance with the OWASP guidelines for enterprise web applications. This improvement is a priority given that the system safeguards sensitive academic information of the institution.

Regarding future lines of work, the following priority extensions were identified: (1) incorporation of usage analytics to identify work patterns and areas of continuous improvement; (2) extension of the functional ecosystem towards teacher evaluation and schedule planning; (3) development of operational intelligence dashboards for academic managers; and (4) implementation of automatic notifications for the follow-up of the PUA review flow. These lines are inscribed in the vision of a comprehensive academic management platform for the Facultad de Ingeniería of the Universidad Autónoma de Campeche.

7 CONCLUSIONS

The implementation of the learning unit program management system confirms the technical and operational feasibility of a tailored web solution to manage university academic planning with professional development standards. The decoupled Laravel-React-MySQL architecture, supported by a relational data model structured into three levels, made it possible to centralise critical processes and mitigate the risks of documentary dispersion, information duplication, and dependence on individual knowledge identified in the initial diagnosis.

In terms of operational value, the system optimised the times for data entry, query, and document issuance; reduced errors due to duplication or inconsistency; and provided change traceability through PDF versioning with integrity verifiable by SHA-256 *checksum*. These results are directly transferable to MSME-type contexts where administrative efficiency and information control represent competitive advantages (Laudon & Laudon, 2016).

The learning unit program management system demonstrates that *in-house* development, when supported by a solid iterative methodology (Beck *et al.*, 2001) and an architecture grounded in established software engineering patterns (Fowler, 2002; Gamma *et al.*, 1995), can outperform the limitations of generic software, providing functional control, economic feasibility, and direct alignment with institutional processes. The platform is considered stable for expanded institutional deployment and presents a high capacity for modular scaling towards the functionalities identified as future work.
